IT is said in Washington that Secretary Endicott is the most icily unapproachable man in public life there, largely owing to the fact that he is unable altogether to rid himself of a notion that he is still a Judge of the Supreme Court of Massachusetts.

SINCE his removal from office by the President, Governor Murray, of Utah, has been almost overwhelmed in a flood of letters from all parts of the country expressing regret at the event and appreciation of his work against the atrocities of Mormonism.

SENATOR JAMES INGALLS, of Kansas, is described as manly, faithful, eloquent, thoroughly American and thoroughly patriotic, scorning hypocrisy and destroying imposture. No Senator has a larger or more attentive audience He is witty, too, and ironical—especially ironical, and covertly sarcastic.

THE Cabinet is ailing: Sec. Manning has had a "stroke," is very sick, and can hardly resume official duties for a long time, if ever. Attorney-General Garland is in quite poor health—a bad cold, probably aided by Pan-Electric worry. Sec. Lamar has been unwell, but is getting better now. Sec. Bayard is recovering from the shock of his late double bereavement.

Real Estate.

NORTHWESTERN LAND AGENCY,
ST. CLOUD, MINN.

Tobacco Planters, Attention!

We are still on deck, and selling regularly all the old crops, and lots of tobaccos consigned us for the German Market, as many of our planters can testify who have sold through us, and have now got their money and account sales, for goods they could not sell elsewhere. We desire to announce that we can place us much more of odds and ends, and also some good crops should any one have them; also that during the months of March and April, we can be found at our office, ready to buy by sample, 1885 Crop Tobacco, that is **assorted** at prices to suit the times. Suitable for home trade and export. Call and see us at the old stand.

HENDERSON'S NEW MAMMOTH VERBENAS.

An entirely new race of Verbenas, of dazzling colors and enormous size. Every flower in the set (of 14), when well grown, will measure 9 inches in circumference, and the single florets are as large as a 25-cent piece. Our engraving represents the variety called "CENTURY," a dazzling scarlet, with a white centre. The other varieties in the set are equally beautiful and distinct. They consist of: Crystal, pure white; Damson, rich purple, white centre; Edith, salmon shaded carmine, white centre; Emily, royal purple, white centre; Fanny, violet rose, white eye; Glow-Worm, brilliant scarlet; Jean, pink, white centre; Lapiz-Lazuli, blue, perfect form; Miss Stout, carmine scarlet; Maltese, lilac, shaded blue; Mrs. Massey, salmon pink, large white centre; Marlon, mauve, white centre; Nelly Park, orange scarlet; Century (see engraving).

Plants of any of the above sent post-paid by mail for 30 cents each, any four for $1, or the entire collection of Henderson's 14 New Mammoth Verbenas for $3. Please remit by Money Order, Express Order, or Registered Letter.

Our Catalogue for 1886, of 140 pages, containing colored plates, descriptions and illustrations of the NEWEST, BEST and RAREST SEEDS and PLANTS, will be mailed on receipt of 6 cents (in stamps) to cover postage.

GREAT SUCCESS TO OUR NEW DEPARTURE IN THE SEED TRADE

SEEDS AT YOUR DOOR AT WHOLESALE PRICES.

In order to sell our seed crop—1886—direct to the planter, we make the following PROPOSITION: For 60 CENTS in postage stamps or money, we will send by mail post-paid, 19 PACKETS one each, of the following new and improved seeds:—Bastian's Early Blood Turnip Beet, the earliest and best for table use. "BEST OF ALL" BEANS most remarkable snap short bean in the world. Pods as tender and buttery in winter as in summer. Hawaii Sugar Corn from the Sandwich Islands; the sweetest sugar corn that grows. Early Etampes Cabbage, best and earliest of all early varieties. Sure Head Cabbage, best winter cabbage in cultivation. Wilson's Early Green Cluster Cucumber, good for early cucumbers or pickles. Golden Self-Blanching Celery, needs no banking up; excellent quality; keeps all winter. Perpetual Lettuce, tender and crisp all summer. Pride of Georgia Watermelon, none sweeter or better. THE SPANISH NECTAR a new muskmelon from the south of Spain. First premium at Penna. State Fair. Pronounced the best-flavored muskmelon in the world. New Red Queen Onion from Italy. Grows large onions from seed first year. Tennessee Sweet Potato Pumpkin, none better for pies or custards. Abbott's Improved Sugar Parsnip. Ruby King Pepper, the largest and finest sweet pepper ever seen. Improved Long Scarlet Radish, best for early use. Half-long Strasburg Radish, good for spring or summer. New Brazilian Sugar Squash, sweetest and best-flavored, for summer or winter. Livingston's Favorite Tomato, large, smooth as an apple; productive; solid. Early White Egg Turnip, sweetest and best for table use. In all 19 PACKETS for 60 CENTS; TWO COLLECTIONS for $1.10; FOUR for $2.00. ANOTHER PROPOSITION To adorn your homes and make life pleasant, as we grow flower seeds by the pound, bushel and by the acre, to give our lady friends the benefit of the wholesale trade, we will send by mail 18 PACKETS one each, of the following, for 30 CENTS Asters, fine, double, mixed. Balsams, extra large, double, mixed, scented. Double Rose-flowered Portulacas, nearly all double; all bright colors. Pansies, finest strain. Petunias, large-flowering. Phlox Drummondii, all bright colors. Verbenas, fine, beautiful colors. Zinnias, large, double, bright colors. One fine Ornamental Grass. One splendid Climbing Plant. One beautiful Everlasting Flower. In all, 18 PACKETS for 30 CTS.; TWO COLLECTIONS for 50 CTS. *Directions for cultivating on each packet.* ONE COLLECTION OF FLOWER SEEDS AND ONE OF VEGETABLE SEEDS FOR 80 CENTS, OR TWO OF EACH FOR $1.50. THE MAPES MANURES.

Cauliflowers, Cabbages, etc.

Cabbages (15 *acres*), *Potatoes, etc.*

CHAS. COLLINS, Queens Co., N.Y., November 23, 1885, writes:

I used five tons of your Potato Manure and raised five hundred and thirty barrels of the largest and best potatoes that went into New York market. There is nothing in the market to beat your Potato Manure that I know of. I planted fifteen acres of cabbage, using one thousand pounds of Mapes' Cabbage Manure to the acre, alongside of stable manure, and using both pretty heavily. Where your manure was used, turned out the best cabbage. They were the largest and solidest. Your Corn Manure has given good satisfaction.

1,000 *barrels Cauliflowers from four acres.—Used Mapes' eight years.—Land improved.*

WM. H. TUTHILL, Suffolk Co., L. I., N. Y., November, 1885, writes:

I have used the Mapes Manures for eight years with uniform good results, having, when season is at all favorable, excellent crops. My potatoes are a very good crop this season. My cauliflower crop was very fine. I shall ship to my commission men over 1,000 barrels from 4 acres. Wherever Mapes' Manures have been used on my farm I always see, in after crops, the lasting effects, and firmly believe that my land has been improved by the use of Mapes' Manures.

921 *Barrels Cauliflowers* ($1,247) *from 4¾ acres.—"Believe if I had used the Mapes on the other ¾ acre, instead of another brand, that I should have realized* $100 *more from the piece."*

F. ASBURY TUTHILL, Suffolk Co., L. I., November, 1885, writes:

Used the Mapes Manure on potatoes and cauliflowers.

Used 3 tons of the Cauliflower Manure on 4 acres; had 4¾ acres in cauliflowers; on the ¾ acre used another brand; sold 921 barrels ($1,247) from the 4¾ acres; believe if I had used Mapes on the other ¾ acre, instead of another brand, I should have realized $100 more from the piece.

Have used the Mapes since they were first introduced here and have never failed to get a good crop since I used them. I am a strong believer in the Mapes Complete Manure for large profits and lasting results from their use.

Now is the time to Top Dress Grass Lands and Lawns, Fruit trees—Strawberry beds.

POTATO TESTS CONTINUED.

In view of the near approach of the time to plant potatoes in the North, we hasten the reports of our last season's tests of new varieties, and, to save space, present them in small type.

EARLY OTOE from Dan'l Young. No address. (Our notes are missing.)

W. ATLEE BURPEE & Co., of Philadelphia, sent us a tuber (no name) that they had grown with good results for two years. They desire to know if we recognized the variety. Five large pieces were planted, though not until July 10. The vines made a fair growth, but, strange to say, not one tuber, large or small formed.

LATE VERMONT, from Myron C. Safford & Co., Mt. Safford Farm, Salem, N.Y., who wrote: "It is a sport from the Extra Early Vermont in 1879, and has been grown only by us. It has always yielded a large crop of choice potatoes. Late, red, oblong; likes a heavy soil; has produced three times as much crop as its parent alongside. Has proved better than White Star, White Elephant, Late Beauty of Hebron, etc."

The yield with us was 16½ pounds from five pieces planted. The largest five weighed 3 pounds 8 ounces. There were 83 tubers, of which but 40 were marketable, the others being too small. This would be at the rate of 708 bushels to the acre in our rich garden soil. Eaten Nov. 19. Flesh nearly white, mealy, of good quality. Buff skin, often reddish at one end. Shape as shown in our illustration, Fig. 157, but often cornucopia-shaped or curved, and smaller at the seed end.

EARLY DURHAM, from C. E. Allen, Brattleboro, Vermont. Six pieces were planted May 20. The yield was 18 pounds.—84 tubers, 38 of which were of marketable size. Best five weighed three pounds 10 ounces. Yield per acre at the rate of 726 bushels. Light skin, oblong shape, often rather small at both ends, as shown at Fig. 158. Eyes medium in number and not deep. Eaten Nov. 18. Flesh yellowish white, of the first quality.

SNOW QUEEN, from O. H. Alexander, Charlotte, Vt., Six pieces were planted April 21, and yielded six pounds, or at the rate 242 bushels per acre. Best five weighed two pounds 11¼ ounces. A sturdy-looking potato, roundish-cylindrical, not long, a little flattened. Eyes medium and few. There were 36 tubers, of which 22 were of marketable size. Eaten Dec. 29. White flesh, mealy, quite dry. Late. (Fig. 159, p. 251.)

CHAMPLAIN, from same. Five pieces were planted April 21. They yielded (guessing at it) at the rate of about 50 bushels to the acre. Egg shape, skin smooth, few eyes. Late.

SILVER SPRAY, from same. Five pieces planted April 21. The yield was 13¼ pounds, or at the rate of 653.40 bushels per acre. There were 105 tubers, 45 marketable. Best five weighed two pounds. No silvery color to skin. Claimed to be a cross between Silver Skin and Magnum Bonum. Late. Skin light buff; roundish and irregular in shape. Eyes sunken. Many small tubers. Eaten Dec. 6. Soggy.

ELBERON, from same. The yield was at the rate of 403.33 bushels per acre. Five best weighed one pound two ounces. Only one half marketable. Buff white skin, oblong or round flattened, few eyes and those on the surface. Eaten Oct. 19. White flesh, fine grain, mealy. A potato of the first quality. Planted April 21 matured August 13.

FROST, from same. Four pieces yielded seven pounds or at the rate of 433.50 bushels to the acre. Best five weighed one pound 10 ounces. There were 29 tubers, 27 marketable. Round, flattened, shapely. Eyes few and superficial. Skin buff white. Small average size. Eaten Oct. 18. Fair quality, white flesh, somewhat darkened by boiling. Intermediate.

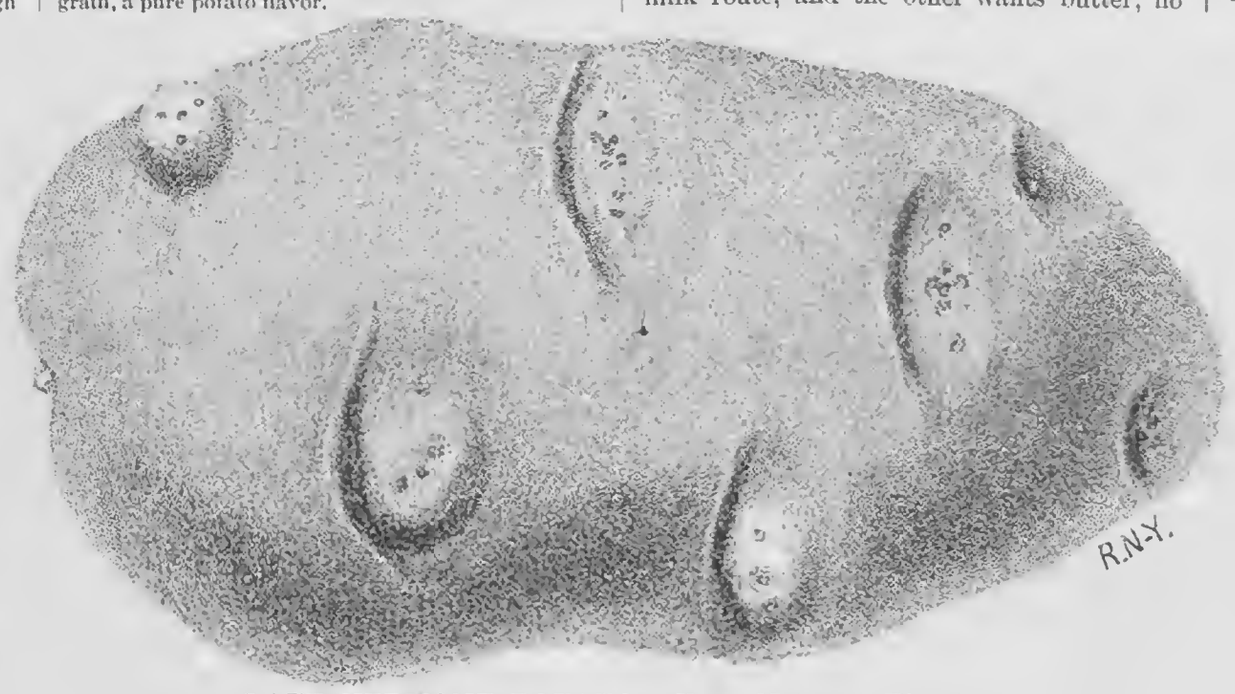
SEEDLING of the Early Vermont, from C. A. Gardner, Dimondale, Eaton Co., Mich. Planted April 22. Yield per acre, 363 bushels. Late. Marketable potatoes as 10 to 13. White buff skin. Shape roundish. Eyes medium in number and depth. Not eaten separately.

PRIDE OF CARLTON from A. M. Carlton, Carlton, Orleans Co., N. Y. "Seed from Whipple, sown in Spring of '83." Three pieces yielded three pounds, all small. There were 42 tubers, none marketable. Yield per acre, 242 bushels. Medium late.

BAKER SEEDLING (see Fig. 160, p. 251), from John Baker, Albion, Orleans Co., N. Y. Box 471. From seed of the old Peachblow." Planted May 4, matured Aug. 13. Two pieces yielded seven pounds. Five best weighed two pounds five ounces. There were 28 tubers, 21 marketable. This yield would be at the rate of 847 bushels per acre. Short, cylindrical. Eyes medium, light skin. Eaten Oct. 16, flesh nearly white, slightly yellowish, very mealy. This potato began to rot early. Mr. Baker wrote that he found it earlier than Early Rose or Beauty of Hebron. Planted May 4th, it matured here Aug. 13.

EARLY COBOURG, from James Haynes Cobourg, Ont., Can. He says "Four years from seed-ball. Fully 10 days earlier than the Early Rose. It yielded last year at the rate of 508 bushels per acre on land that was planted with potatoes 11 years with only a light coat of manure." "Two years ago" he continues, "the potatoes were planted on the 20th of May, and on the 1st of August there were potatoes as large as hens' eggs."

We always like to give the originator's account of his own seedling. We planted five pieces May 20, and they matured August 25. The yield was 11 pounds—75 tubers, 45 marketable. Best five weighed two pounds three-and-one-half ounces. This would be at the rate of 532.40 bushels per acre on our richest land. Buff-white skin, sometimes pinkish. Shape oblong. Eaten Nov. 26. Flesh white, of the first quality; mealy, fine grain, a pure potato flavor.



LATE VERMONT POTATO. From Nature. Fig. 157.

Dairy Husbandry.

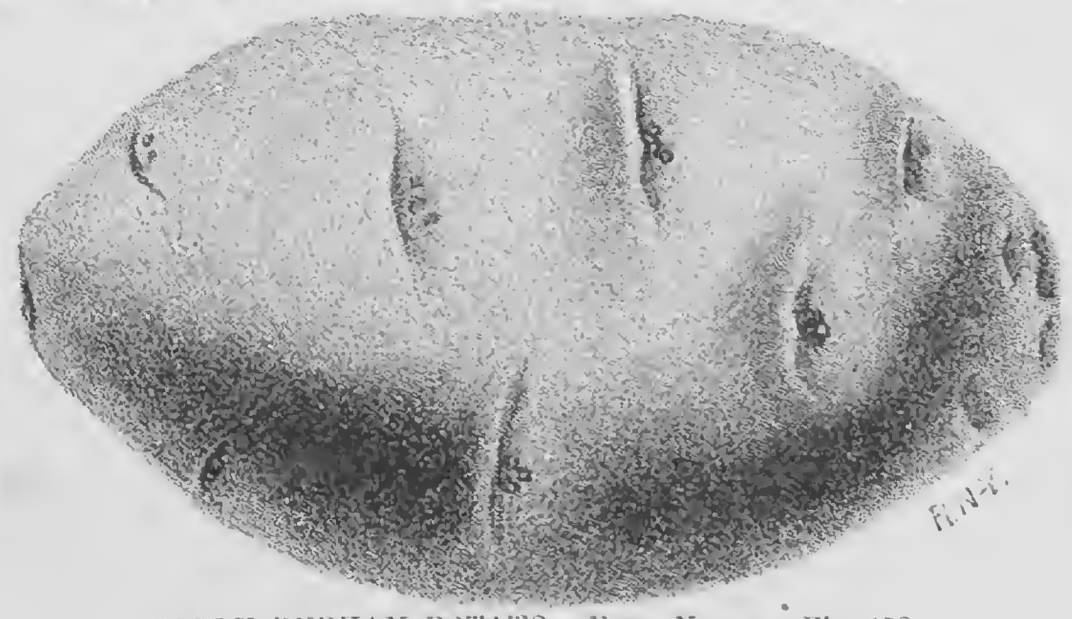
DAIRY NOTES.

CORN AND CLOVER.

THE one supplements the other. What better than clover to prepare the soil for a crop of corn, and what better than corn to follow a crop of clover? Clover is not only highly nitrogenous, but the king of plants in attracting nitrogen — whether from the soil or through the soil, or directly from the air, matters not. It supplies nitrogen to the soil. Early-cut, well-cured clover is strong feed for muscle and milk—especially cheese. Corn, the stalk and grain, is rich with fat-producing, heat-producing elements. The two—corn and clover—combined, make a well-balanced ration. Dairymen cannot do better than to grow and feed both.

THE GENERAL-PURPOSE COW.

A great deal of discussion has been going on during the past year over the question of the general-purpose cow. Of course, every disputant has given his own meaning of such a cow. One wants a beef carcass as a *finale*. He is therefore more of a beef-producer than a dairyman. Another is content with a cow that gives him a profit year after year as long as he keeps her in his dairy herd. The carcass with him is of minor consideration at the end. He is a dairyman. But there are two kinds of dairymen. One wants a large flow of milk to take to the cheese factory or to supply a milk route, and the other wants butter, no matter how small the mess of milk. Which of these three classes of cows is the general-purpose cow? The beef-grower will claim this distinction for his cow, and the milk producer for cheese and market will claim it for his. Each is right from his own stand-point, and the demand of his business. The butter-producer alone is the special purpose cow—she makes butter only, and has no value apart from it. Why wrangle about the distinction? Let every man select his own general-purpose cow to suit his own line of business.



EARLY DURHAM POTATO. From Nature. Fig. 158.

CONDITIONS OF DAIRYING.

For some years past, the impression has been abroad upon the public mind that dairying pays better than any other line of farming. While prices remained up, there was good ground for this impression. But the success was because dairying has made more progress and has been practised more systematically than most other lines of farming. Yet, dairying is far from being reduced to a scientific basis. This, however, no one has stopped to think about; but all who could scrape together a few cows—good, bad or indifferent—have gone into the business of dairying. The result is that there are thousands in the business to-day who are not fit for dairying and never will be good ones, and many who have not the farms adapted to it, nor the conveniences for its successful pursuit. All the old scrubs and ungainly animals of every breed have been retained in the business. They are now kept at a dead loss, and the sooner they are disposed of the better for their owners and the dairy community. Now is a good time for all the incompetent and unqualified dairymen to drop out. Some of them will be frozen out; all ought to get out. They never ought to have engaged in the business. Dairying at any time can be carried on successfully only under the proper conditions. The weeding out of all the poor cows and all the poor dairymen, just now, would be a public blessing. It would give more relief to the market than the suppressing of bogus butter. But while it is a good time for poor dairymen to drop out, there never was a better time for those who understand the business to stay in, spread their sails and get ready to take advantage of the propitious gales that are sure to follow. According to the Census Bureau, the increase in milch cows in 1885 was a fraction over 80,000.

T. D. CURTIS.

BOGUS BUTTER.

PROFESSOR J. P. SHELDON.

A good name for a bad thing; a pest in England, too; an injurious fraud there also; butter instead of candles; the fraud not in the things but in the pretense; anti-oleo legislation in England.

THERE is a good deal to admire in the vigorous phraseology which you in America employ in reference to things that vex you, and the term "Bogus Butter" is the most telling designation I have yet seen applied to the article which has done and is doing so much mischief to dairy farmers. We British are not as smart as you are in coining expressive phrases. We tamely call the stuff by such names as butterine, oleomargarine, or artificial butter; but we have not in use, and of our own framing, anything like so expressive and energetic a term as the one I have placed at the head of this article. All the same, we are quite as little in love—we farmers I mean—as you are with the stupendous fraud, which is injuring our dairy interests and deluding the public to a degree no one would have dreamt of a few years ago. Probably you have been angry with it longer than we have, and there are explanations to be given for this, and the measure of your anger is, no doubt, greater than ours; but we too are at last taking steps to protect ourselves. In a country like this, into which dairy products have poured in a continuous avalanche for many years past, it is not to be wondered that we were some time before we saw the danger and deceit that were embodied in bogus butter. We had long been unable to supply our people with enough butter of our own making, and we were at the outset rather inclined to welcome butterine as an adjunct that would be useful as a supplementary article of food, particularly for use in confections. During several of the first years, too, it did not appreciably affect the price of butter; or, even if it did, we could hardly bring the charge home to it. And so we tolerated it, and did not in the least interfere with it for several years, until at length w

that large quantities of it were being imported, and we found to our dismay that it had to a serious extent displaced our own genuine butter among the masses of the people, with the inevitable result of a serious drop in the price of the genuine article. It was discovered, too, that many retail provision dealers were selling it freely as butter, at a price with which butter could not possibly compete, and we saw then clearly enough that our dairy interests were in imminent danger of ruin from a competition which no one could say was honest.

With you the case was different. You had been exporting butter for a long time, and, when an imitation article began to be freely put on your markets, you at once saw it was an interloper where no sufficient cause could be given for its appearance at all. We wanted it, and you did not; that made all the difference. Animal fat made up into a form convenient for utilization in cookeries, was no doubt a legitimate enough thing, even in America, because such fat had to be utilized in some profitable manner if possible; but when it boldly came out as an imitation of butter, it was time that you took notice of it. It is not surprising, after all, that it should have had its inception in your country, for you are an eminently original and inventive people, great at innovations. Further, your petroleum wells were pouring out oil to light the world, and candles went out of fashion, and almost out of use; so that the fat which had aforetime been employed to light up your houses at night was no longer wanted for that purpose, for you burned paraffine instead. We may wonder, indeed, at what price butter would have been sold to-day, if gas had not been invented and petroleum never discovered. These two illuminants have set fat at liberty for other uses, and hence we have bogus butter in abundance.

I consider there is no room to complain of or condemn the utilization of animal fat for food, when it is not required for light. It is in itself a valuable thing and to waste it would be a crime. To employ it as food for the people is also a perfectly legitimate thing to do, for it is essentially an article of food, and always has been, and always will be, among most of the races of mankind. With this abstract statement of the case I fancy no one will be inclined to cavil; as, indeed, no one reasonably can. But when it is made up in a guise which is, to all intents and purposes, intended to imitate something else, and to impose on the public by means of the likeness it bears to butter; when, indeed, it is actually sold for what it is not, and a price over and above its market value is obtained for it by means of this misrepresention; then, in the name of all that's honest, we have a fair and just right to complain. It is, we contend, doing a great injury to dairy farming; but it is not for this reason, first of all, that we take up arms against it. The head and front of the offending lie in the fact that it does this injury, not by means of what it is, but by means of what it pretends to be; not by the help of its intrinsic value, the worth of which we freely admit, but by the simulation of something which is better and more attractive than itself.

We demand, therefore, not that bogus butter shall be prohibited, not that it shall not be made and sold; but that it should never be sold except under a name which fully and properly and honestly indicates what it is. In this demand there is nothing to which the bogus butter people can justly take exception; there is nothing prohibitive in it, nothing retaliative, nothing unfair. All we want is, that the public should not be deceived, and that dairy farmers shall not have to contend against a dishonest competition. Then the butterine manufacturers may make and sell as much of it as they can induce the public to swallow, and we shall have no further fault to find.

A bill to this end has been introduced into the House of Commons, and there is reason to believe that it will meet with a favorable reception. When this bill has become law, it will rest with dairy farmers to stand or to fall in competition with bogus butter; and, in order to stand, it will be necessary that they shall produce butter of a character superior to a great deal of what is now found in the market.

Surrey Co., England.

A FRIENDLY COUPLE.

ABOUT a year ago I bought a cow and her calf. We made veal of the calf as soon as possible, and the cow seemed not to get over the loss of her calf all Summer, being restless and fretful, so that sometimes I turned a neighbor's cow into the yard at night to keep her quiet. Late in the Fall I bought a pig, some three or four months old, and turned it into the same yard, merely for convenience. The cow and pig made friends with each other rightaway, and slept in the same shed at night, snuggled close as the weather became cold. During a severely cold term not long since, the cow dried off suddenly, but the boy was directed to strip her for the last drop twice a day to bring her back if possible, and we arranged to give a little more green food to "poor Bossy." Still no improvement. After a week or so, one evening the boy came to the house with his face in a broad grin, and said that he had caught the pig sucking the cow! Mr. Pig was shut up by himself, and now the cow frets the same as if it was a calf shut away from her. She can see the pig, and there she stands mooing for it till we all nearly die with laughter. We have set up our cream jar again, and have mush and milk for supper occasionally. R.

The Herdsman.

FROM CALF TO COW.

Raising calves for milch cows; breeding; care of cow and calf at birth; early feed of calf; "no crowding;" the "farmer's cow."

HERE is my method of raising calves for milch cows; it was practiced by my father long before he began raising pure-bred cattle. His invariable rules were, first, never to raise a calf (bull or heifer) from a poor or medium cow; second, never to breed from a bull, no matter how fine personally, that was not from the best of milking stock. As a result, neither he nor I have ever had more than three poor cows. An animal should not only be pure-bred, but of a superior milk and butter lineage. I would be even more particular of the breeding of a bull than of a cow. The breeder who will allow a poorly-bred calf to go from his herd is at least unscrupulous. Farmers make a great mistake in using scrub and picked-up bulls. At present a finely-bred bull calf can be bought for what he will sell for beef in three years, so that there is little economy in buying anything but the best.

I take the calf, as soon as born, to a warm stall, rub it with dry straw and cloths until thoroughly dry and warm; give it good bedding, and then if it is active, leave it alone for six or eight hours. Meanwhile the cow has been given a pail of water as warm as she will drink, and been milked, and the udder has been properly cared for. If my stables were cold, I should keep the cow blanketed for a few days. Many cows fed on dry feed, carry their "cleanings." To prevent this trouble, I feed very little corn meal or other feverish grains for several weeks previous to calving. For about four weeks, I give the cow, mixed with her bran, a small handful of unleached wood ashes once a day, having found ashes a great help in cases of abortion. When the calf is from six to ten hours old, the cow is again milked into a calf pail, and the calf is immediately taught to drink. Oftentimes it will drink at once, needing not even a finger; but generally this must be given two or three times. Don't give the calf too much, or its appetite will not be good next time. Don't crowd it at any time if you are breeding milking stock. Farmers intending to go into thoroughbreds, often start with a few calves. The desire is to keep these a little extra nice and fat. To them, above all, does this warning apply. Don't crowd them. If you do, I guarantee that in four years you will say that it doesn't pay to raise thoroughbred cows for their milk. I have seen calves that, when a week old, showed indications of turning out good milkers, so "crowded" that when a year old their nature seemed to have been changed, and they appeared fitter for beef than milk production. A change of this kind once effected cannot be undone. I have generally given my calves new milk twice a day until they are a week old, then I have substituted sweet skim-milk, warmed. From this I work them on to sour milk, and from this, if I must, to warm water containing a good handful of scalded finished middlings. This ration is increased to a pint at the age of six months, and kept up until they are turned out to grass as yearlings. This feed may be changed according to the quality of the dry feed given. Let the calf have plenty of room for exercise, plenty of light, and a warm, dry, soft bed; then it ought to prosper.

I seldom show my calves to people whom I do not know to be good judges of stock, because they have not that glossy, oily coat which characterizes a calf bred for beef. They are not poor, but are in what we call a good, healthy growing condition, and in this condition I strive to keep them until they are no longer profitable as milkers—then I crowd them.

The common farmer wants a cow that is hearty, strong, active, a good milker every year and 11 months of the 12. Fancy cows are for those dealers who, when selling under records obtained by inhuman crowding, defraud their customer as badly as any swindling concern in the country, and cause the early death of many of the tested cows. Make any good farmer a present of a cow with a record of 20,000 pounds of milk, under the stipulation that she shall have the same treatment of his other cows, and the chances are that she will fail the herd as his poorest cow. When record men will truthfully advertise not only the individual yields of butter and milk, but also the care and feed their stock have had, then we can tell what cow to buy. The cow that gives the most milk or makes the most butter is not necessarily the best cow, but rather the cow that does the most from a given quantity of feed. A Holstein would starve on the feed required to keep an Ayrshire in a good flow of milk. Give extra feed to the Holstein and she distances the Ayrshire perhaps. The question now comes home; Does the extra amount of milk pay a fair per centage of profit for the extra food required? D. P. S.

Auburn, N. Y.

RUTABAGAS POOR FATTENING FEED.

I NOTICE in a January issue of the RURAL, that Prof. Brown is credited with having said that animals cannot be fattened on roots without grain. My experience in feeding rutabagas, the past Winter to fattening cattle, confirmed this opinion. I was fattening two large oxen and two farrow cows, both giving milk and above the average size. From the middle of November until about the middle of January I gave each animal all the good hay it would eat up clean, three times a day; a certain amount of ground feed, composed of middlings and corn meal, and one bushel of rutabagas. The ground feed was put on the cut roots. About the middle of January my roots were frozen, and I discontinued feeding them, but in their stead I added two-and-three-quarters pounds of corn meal; otherwise the animals were fed the same as before, with what water they would drink once a day: when they had the roots I gave water in the same way. The cattle remained in the stable continually after I put them up in November. The weather for the second and third weeks in February was not so favorable as before, but they all put on much more flesh on the two-and-three-quarters pounds of extra corn meal than on the bushel of rutabagas per day, fed to them previously, and the cows gave more and a better quality of milk.

Is it possible that one bushel of rutabagas is not worth as much to feed to fattening cattle as two-and-three-quarters pounds of corn meal? This was my first experience in feeding rutabagas to fattening cattle; but from reading agricultural papers and books, and learning what great stress some writers put upon the growing of roots, I had concluded that rutabagas must have a feeding value of 15 or 20 cents per bushel, as compared with grain.

Hillman, Mich. J. H. S.

Field Crops.

DRILLING FIELD CORN.

Satisfactory figures; thorough preparation; drilling; cultivation; ear development.

LAST year I planted my corn with a Champion grain drill. The result was so satisfactory that I give below an extract from my books. We are in Northern Ohio:

The entire field averaged 100 bushels per acre, meaning a heaped bushel basket, of which 1⅜ make a bushel of shelled corn; price 45 cents, its value as feed, and less than its market price.

Debit.	
Plowing 6½ days @ $3.00	$19.50
" 2½ " @ 3.50	8.00
Dragging 5 " @ 3.50	17.50
Pulverizing 1 day @ 3.50	3.50
Drilling 1½ " @ "	5.25
Use drill	3.00
Seed corn, five bushels @ $1	5.00
Phosphate, 4,000 pounds @ 1½c	60.00
Seeds, squash, pumpkin, etc	1.75
Planting seeds	3.00
Replanting, one day	1.50
Cultivating, once in row, 2½ days @ $2.50	6.25
" twice in row, 8 " @ 2.50	20.00
Thinning, etc., 12 days @ $1.25	15.00
Cutting 1,513 shocks @ 1½c	22.70
Husking and cribbing 1,498 bushels @ 1½c.	67.41
Total debit	$259.36
Credit.	
1,498 bushels @ 27c. in field	$404.46
15 acres fodder @ $5.00	75.00
Load Hubbard Squashes	2.50
8 loads pumpkins @ $1.00	8.00
5 " " @ 50	2.50
20 bushels turnips @ 15	3.00
Total credit	$495.46
Balance	$236.10

The estimates for work are figured at the regular rates for labor in this section. The history of this crop proves conclusively that planting corn in drills is far superior to the old system of hilling. It has also convinced me that the most complete pulverization of the soil is necessary, and that extra work done at the beginning of the season pays well.

The field on which this crop was grown had been cultivated seven successive years and fertilized only with bone and superphosphate, though a clover sod had been plowed down once in beginning. The season was late and most unsatisfactory. The corn was not among the earliest varieties and was not planted until June 4th, as I delayed planting rather than give up a last dragging. After plowing and dragging thoroughly, the pulverizer was put at work and the soil completely reduced for the drill.

A common wheat drill was used, adjusted so as to drop more than four kernels to the hill, in rows three-and-a-half feet apart, each way. The fertilizer was deposited through three hoes of the drill for each row of corn, the seed being drilled into the middle row. This gave the plant a wider feeding ground, more nearly approaching the plan of broadcast distribution of plant food. Before the corn came up, a heavy rain formed a hard crust on the surface, which prevented the germination of the vine seeds; consequently a small crop of squashes and pumpkins resulted. To abate this trouble, the soil was diligently worked with a wing cultivator, running close to the rows, which had been made as straight as possible. Thinning was carefully carried out. This leads me to introduce what I consider one of the chief arguments in favor of drill culture. My observation goes conclusively to prove that fully 25 per cent more stalks will produce ears when the stalks are sufficiently apart than when they are crowded together in hills. In fact, it was a rare exception to find a stalk without at least one fully developed ear. Our aim should be to get one perfect ear to a stalk, before trying for more. Every variety of corn I have ever observed, produces, in embryo, one perfectly developed ear at each of four or five of the joints from near the ground up. And these miniature ears can be observed, by divesting them of their miniature husks, at any time before any ears have appeared above the enveloping leaf-sheaths, perfect in every particular, except as to maturity. Hence, it is safe to conclude that if we are to expect extra development of ears, we are to look for it through the medium of better cultivation, and such a seeking out of food rations for the growing plant as shall enable it to develop the possibilities which every stalk of corn displays. A further fact in this connection, is that such varieties as have been brought to produce a multiplicity of ears, rapidly deteriorate unless the best of methods are adopted in cultivation. It was a close shave for my crop to mature the single ear per stalk, in time to escape frost.

Cuyahoga Co., O. A. W. RUSSELL.

NEW ZEALAND GRASS FOR THE SOUTH.

WHY can we not utilize or reclaim the old Broom Grass fields of North Carolina and Virginia? I have had five years' experience there as a farmer, and I find peculiarities about the soil, which convince me that there is a good starting point to make it an important cattle or sheep country. Clover will not do well except on rich spots. It will not "catch," or it will bloom at four inches high and "starve out." Wheat and corn are poor crops. Tobacco very uncertain. My opinion is that some grasses can be imported that will revolutionize farming at the South. It is useless to tell a practical farmer what crops of grass signify—beef, mutton, hogs, wheat, corn, mills, immigration without solicitation, factories of all kinds, roads, fences, railways, good homes, education, tall church spires, in short, every comfort in life. My seven years' experience in New Zealand convinces me that the common Prairie Grass saved and made the country. Though as tough as wire, a horse goes a hundred miles a day on it better than on oats. I tended a flock of 25,000 sheep on it, and a flock near us numbering 100,000 never ate a bite of anything else in their lives. Why not try it here? If not successful, ransack the whole earth for a grass that can feed on the elements yet left in the soil. It only needs a little enterprise and a very small outlay by a few men to gain the prize. Try Australian Grass, Tasmanian, New Guinea, or any other that can be found. One will surely be found that will grow as well as Broom Grass which is almost useless, but might be utilized for manure, or if cut up fine for chopped feed with meal. J. C.

Petoskey, Mich.

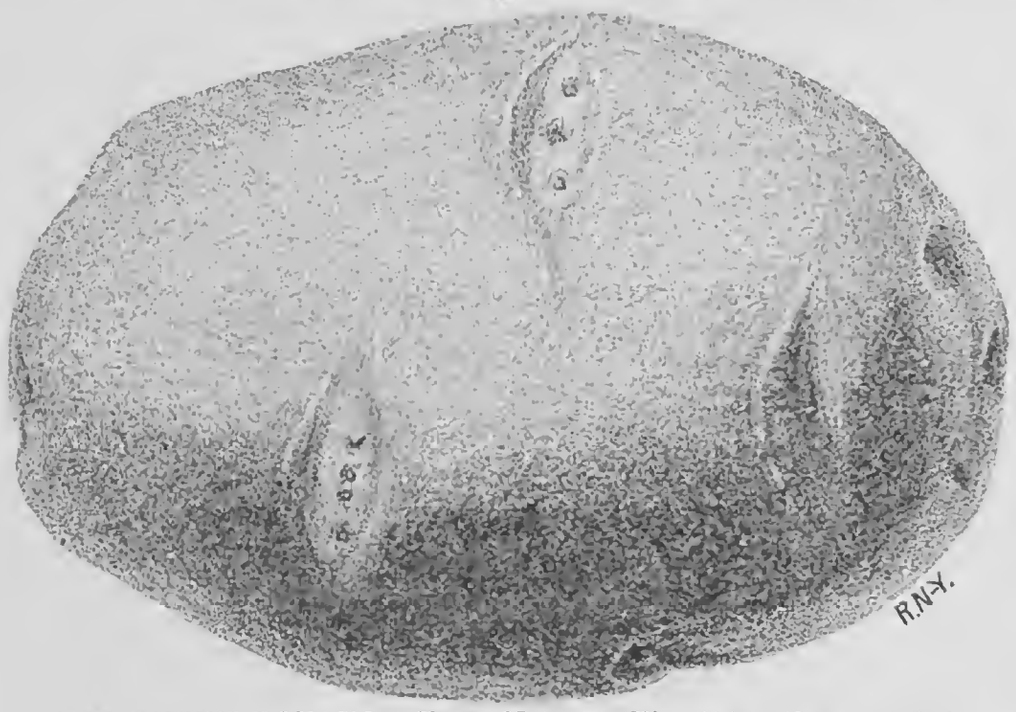
Farm Topics.

WHO?

THE number of words in the English language is enormous, and the expression of the same meaning by different words is a stumbling block to foreigners who attempt to learn

them. There are three words in common use by farmers that might well be dispensed with, viz., "Haw," "Gee" and "Whoa." Why should not a driver who wants his team to turn to the left, say so, or for short, "left!" instead of "Haw," and "right" instead of "Gee," The same objection may be made to "Whoa," when used instead of "stop!" Animals would learn the meaning of one as readily and as quickly as that of the other, and as readily obey it. They do not reason as to the derivation or meaning of words, but are governed by sound. I once had a horse brought from a brisk trot to a sudden stop by the voice of a large Newfoundland dog by the roadside, which saluted us in passing with a sound that was as near "Whoa" as a dog could make it.

Sailors might, with the same propriety, omit from their vocabulary Starboard and



SNOW QUEEN POTATO. From Nature. Fig. 159. (See page 249.)

Larboard or Port, and with the advantage that landsmen would know what they meant when they used "right" or "left" in place thereof.

Who will be first to train a team to be governed by the words "right," "left" and "stop?"

L. A. R.

BEST WAY TO FORCE YOUNG DUCKS.

Plant lettuce seed in one corner of a lot; when two or three inches high, cut it off; chop it up, and mix thick milk or corn meal with it. Give it to the ducklings, and open your eyes to see them grow. J. S.

Little Silver, N. J.

Horticultural.

THE FLAGEOLET BEANS.

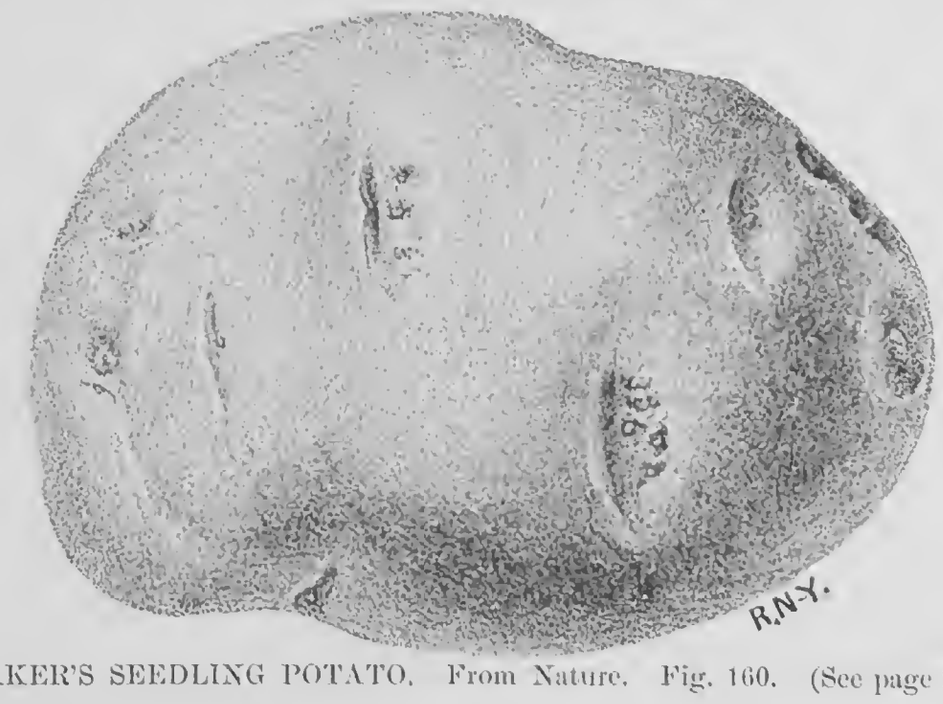
T. H. HOSKINS, M. D.

I notice in the RURAL that Mr. James Hunter, of Massachusetts, thinks that the Flageolet Wax Bean bears the longest pods of any of the wax beans, and he does not believe there is a finer wax bean in cultivation. I have been very much interested in this class or family of beans, and they certainly possess a great deal of merit. I do not see on what grounds, however, the so-called "Green-seeded Flageolet" received the name. There is no one in the whole list of garden beans, which is apparently farther removed in all characteristics from the large Flageolets than this little, strongly covered and round-podded, dark-green colored plant, with its particolored seeds.

A few years ago I received from a friend in Ohio, a quantity of "Flageolet Beans," in which I did not notice any particular difference when planting them, but which, in the two succeeding seasons, easily divided themselves into three distinct varieties, yet all were manifestly of the same family. They may be described as (a) red-seeded, with green pods; (b) red-seeded, with golden pods; (c) purple seeded, with golden pods.

The red-seeded variety of green pods differ but little, if at all, from the bean introduced by various parties as the "Canadian Wonder," or the "Rose Beau." It is a vigorous grower, and heavy yielder, perhaps the most so of the three: but is less delicate in flavor, either as a snap or shell bean, than either of the others. The red-seeded, with golden pods, is a bean of great merit, a good grower, productive, and with long, straight pods which have never spotted in the least with me. In fact, this is characteristic of all three, and is a point of much importance, especially to those who grow them for seed. Ferry's Golden Wax, which is no earlier, or better, spots so badly with me that only one or two pickings can be made before they are ruined. This red-seeded variety is distinguished from the succeeding (purple-seeded) by showing no red upon the seed until it begins to harden and color all over, while the purple-seeded shows a bright red eye almost as soon as the bean can be distinguished in the pod. By the seed alone, the two red-seeded varieties cannot be distinguished at any stage of growth.

In only one catalogue (and that a German one) have I seen the Purple-seeded Flageolet mentioned, and there as a valuable novelty. It is very distinct, being nearly if not quite as vigorous and productive as the red-seeded with green pods, in this respect being much in advance of (b). The plants are large with strong stems, which hold the long, straight, golden pods well up out of the dirt. It is difficult to imagine how any more pods could possibly grow on the plant, large and vigorous as it is. Quite a number of gardeners looked over my experimental patch, where 64 different varieties and strains of beans were grown last season, and all agreed that the Purple-seeded Flageolet for a dwarf, and the Mont d' Or for a pole "wax" (yellow-pod) bean, took the lead, and a long one, in their respective classes. The Flageolets have been recommended (by the RURAL I think, and also by others) as being nearest in quality, as a shell bean, to the Limas, of any in cultivation. I think they will bear out that recommendation, and yet they are not Limas. If we are ever going to get a bean equal to the Lima, but hardy and early enough for the northern tier of States, I think it will have to be produced by crossing the Lima upon the White Runner. They are evidently closely related, and it ought not to be difficult to unite, by crossing, the delicacy of the one with the hardiness of the other.



BAKER'S SEEDLING POTATO. From Nature. Fig. 160. (See page 249.)

That Tired Feeling

The warm weather has a debilitating effect, especially upon those who are within doors most of the time. The peculiar, yet common, complaint known as "that tired feeling," is the result. This feeling can be entirely overcome by taking Hood's Sarsaparilla, which gives new life and strength to all the functions of the body.

"I could not sleep; had no appetite. I took Hood's Sarsaparilla and soon began to sleep soundly; could get up without that tired and languid feeling; and my appetite improved." R. A. SANFORD, Kent, Ohio.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

FAC-SIMILE.

FOR SHAVING.

The Genuine Yankee Soap.

Has never been equaled in the richness and permanence of its lather. Especially adapted for heavy beards and a delicate skin. Standard for quality in the U. S. Navy. Has been counterfeited more than any other soap in the world. Notice the engraving and avoid imitations.

ALL DRUGGISTS KEEP IT. Trial Sample for 12 Cents. THE J. B. WILLIAMS CO., Glastonbury, Conn. Formerly WILLIAMS & BROS., Manchester, 1840.

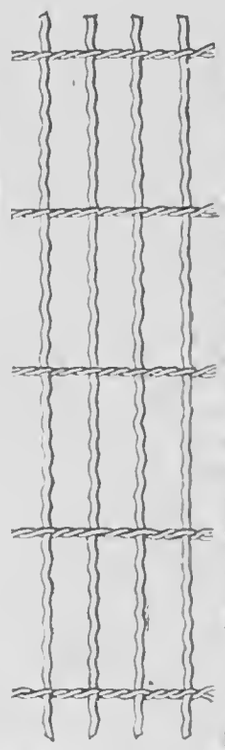
$25 A DAY saved by using the **Little Giant Road Machine**, instead of making roads in the usual way. It is the cheapest and the best. Send for circular. STRONG & PARKER, Vergennes, Vt.

RUSTLESS IRON WATER PIPE. WM. T. WELLS, 7 to 9 Cliff St. New York. Send for Catalogue and Prices.

FAY'S MANILLA ROOFING ESTABLISHED 1866

Takes the lead, does not corrode like tin or iron, nor decay like shingles or tar compositions, easy to apply, strong and durable at half the cost of tin. Is also a **SUBSTITUTE for PLASTER at Half the Cost. CARPETS and RUGS** of same, double the wear of oil cloths. Catalogues and samples free. W. H. FAY & CO., CAMDEN, N. J.

PATENT **CORRUGATED WIRE FABRIC,**



Suitable for Fencing in many locations, and for Railings, Window Guards, Tree Guards, and other purposes.

It consists of vertical pickets or bars, made of corrugated galvanized steel rods, oval in section, secured by horizontal cables, each composed of two strands of galvanized steel wire.

As a fence it is cheap, strong, durable, and easily erected; it is as effective as a barbed fence in turning cattle, and there is no risk of injuring either the animal or the fence; it requires no longitudinal rail to support it, as it carries itself from post to post as well as a plain wire or barbed wire fence; it can be seen as plainly as a regular picket fence; it can readily be taken down, rolled up and moved from place to place.

READ DESCRIPTION GIVEN BELOW

5 Octaves, 12 Stops, Sub-Bass and 2 Knee Swells.

[MENTION PAPER WHERE THIS "AD" IS SEEN.]

CONTAINS 5 SETS OF REEDS, VIZ:

One Set Large Powerful	Sub-Bass Reeds.
One Set Exquisitely Pure, Sweet	Melodia Reeds.
One Set Rich, Mellow, Smooth	Diapason Reeds.
One Set Charmingly Brilliant	Celeste Reeds.
One Set Pleasing, Soft, Melodious	Viola Reeds.

Solid black walnut case, well and substantially made, and elegantly finished and embellished with fancy frets, carved ornaments and gold tracings. Patent Triple Upright Bellows, which are superior to any Bellows ever constructed, rollers, handles, lamp-stands, music-pocket, sliding fall with lock, and all the latest conveniences and improvements.

REMEMBER it is only necessary to send us references as to your responsibility and Organ will be shipped you on 10 days' test trial. If it suits you are to send us its price and pay freight; if it does not suit, you can return it and we will pay freight both ways.

PIANOS We have a limited number of Square, Grand and Upright Pianos in elegant rosewood cases, having every modern improvement, which we will sell at greatly reduced prices. These pianos are warranted for 6 years, and will be shipped on (10) Ten days' test trial before requiring payment.

NEW STYLES NOW READY AT REDUCED PRICES. LARGE ILLUSTRATED CATALOGUE FREE. Be sure and Write to us. We can save you Money

DIMENSIONS:—Height, 75 inches; Length, 48 inches; Width, 24 inches; Weight, about 375 lbs.

CORNISH & CO., Washington, New Jersey

SEDGWICK STEEL WIRE FENCE

Is the best general purpose wire fence in use. It is **a strong net-work without barbs.** Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, Schoollots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is better than boards or barbed wire in every respect. Give it a fair trial; it will wear itself into favor. The **Sedgwick Gates** made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working **all-iron automatic or self-opening gate,** and the neatest cheap iron fences now made. The best **Wire Stretcher, Cutting Pliers and Post Augers.** For prices and particulars ask Hardware Dealers, or address, mentioning paper,

SEDGWICK BROS., Richmond, Ind.

EDWARD SUTTON, Eastern Agent, 300 Market St., Philadelphia, Pa.

(*Continued from page* 251.)

interested in blueberry cultnre, which is extensively practiced in this section. I grow three or fonr hundred bushels each year, and here is the result of many years' experience and personal observations for the benefit of RURAL readers:—

In spite of any assertions to the contrary, blueberries will not grow in cultivated ground, neither can they be grown from root-cuttings, nor can their tips be layered. The only possible way to transplant them is to cut a sod from a matted berry patch and transplant it into *sod* grouud. An old, worn-ont pasture makes the best berry land. A transplanted sod will spread, rapidly killing out all grass and weeds, but the vines surely stop spreading on reaching broken ground. When the berry pasture is once established, all the care it needs is to keep out trees and bushes, and burn the lot over every four or five years to get rid of the dead wood. Of course, that year's crop is lost; but a double one is produced the next year to pay for the loss. A good pasture will yield from 25 to 50 bushels per acre. Cattle will eat the blossoms from the vines, if they get a chance, but will not meddle with them otherwise. A few years ago berries were shipped in bulk in old boxes, butter firkins, etc., and, of course, brought very unsatisfactory prices. They are now sent in round quart boxes packed in open bushel crates. Nine-tenths of them are picked up by dealers from farmers who ship them to market, aud after taking out their expeuse and profit, divide what is left among their customers, according to the number of quarts received from them, irrespective of the quality of their berries. The remaining tenth of the growers own their own boxes and ship their own berries, and as they are interested in having their berries honestly picked, get more satisfactory prices. Pickers are hired on shares and during the season they flock to the pastures from city and town, from factories and from colleges, all eager for money and a good time. Boarding in farm houses, camping out in tents or shanties, they lead a healthy, hard-working, jolly, out-door life. A good picker will pick from one to two bushels a day. Althongh tiresome, it is fascinating work, and many of the same pickers will return year after year. I do not know where the New York market gets its blueberries; bnt Boston is supplied principally from Massachusetts, New Hampshire, Maine and Nova Scotia. The season lasts from the first of July till into September. S. A. H.

New Boston, N. H.

AN IMPROVED GARDEN LINE.

It is a common cotton cord about one-eighth of an inch in diameter, with knots 28 inches apart. It should be long enough for the rows intended to he planted, and can be sighted by the eye, when in use, till perfectly straight. By keeping the end knot in range with two poles at one end of the plot and always setting the plants on the same side of the line close to it, they will be nicely planted for working both ways, and if varieties of free-running habit are chosen, full beds can be grown in this way. In my own case, I set two runners from each plant in the row, keeping all others off, and secured splendid rows for next year's fruitiug. Some Crescents measured 28 inches across the plants.

With such a line knotted at proper intervals, cabbage, tomato or corn, and perhaps many other seeds, can be planted with satisfaction. The advantages claimed for this method are, that no horse is needed to mark out the lines; that the lines will be much straighter and the soil will be left in a better condition for after cultivation. When I first used such a line I marked it with ink; but this soon become colored with the soil, so that it couldn't be seen. "P."

Del. Co., Pa.

Entomological.

CODLING WORM HABITS AND RAVAGES.

The moth harmless; its progeny hurtful; habits and havoc of the larvæ; migration of the pests; mistakes of "scientists;" differences in habits of early and later broods; remedies.

THE codling moth (Carpocapsa pomonella) is powerless to puncture fruit as the plum weevil and some other insects do. Hence no blemish or injury is ever occasioned by it. The mouth parts of Tortrices or leaf-rollers, to which it belongs, are very rudimentary, and the insect takes but little, if any, food from flower or fruit during its winged life. It is the moth's progeny that work all the mischief charged against this most formidable of orchard pests, which infest apples, pears, quinces and even plums and peaches. The feeding of the worm in the calyx causes a fluted growth of the surrounding surface, and produces an apple of a flattened shape, changing a conical apple into a very oblate one, (Fig. 161).

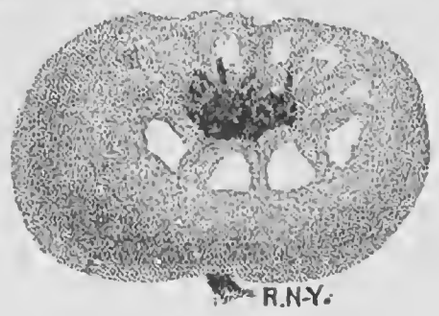

Fig. 161.

The injury induces premature ripening as well as the falling and decay of the fruit.

As a rule, in case of the early part of the first brood, the burrows of the larvæ are from the calyx to the core. With subsequent hatches, there is a decided difference of habit, as seen in fruit which attains full growth and comes to the pickers' notice. The young worm eats out a little cavity under the calyx towards the core. Very seldom does it pass to the core from the calyx. Harris relates that the larva burrows gradually from the eye to the core and through the apple in various directions, and to get rid of the refuse fragments, "it gnaws a round hole through the side of the apple, and thrusts them out of the opening." He represented the insect as remaining its whole larval life in the same apple and burrow, whereas exact observation shows that emigration is a very constant habit. This emigration theory was first advanced by the late S. B. Peck, of Michigan, who claimed to have made the discovery of this peculiarity in 1872, and he sturdily proclaimed it in several publications and at fruit meetings and in the RURAL of 1882, page 689, where it is shown that several experts accept his views. In a letter to me early in 1883, he asserts their natural disposition to wander, whether on tree or in fruit house. He notices that a worm may back out of a burrow before fairly in, and then gnaw a new passage into another apple. He claims, further, that a worm, after gaining half its growth at most, never remains over 48 hours in the same apple. Thus he reckoned that often a single worm visits a dozen apples. Emigration is a fact. The worms feed only a short time under the calyx where the egg hatched. They wander by night to the cheek of the same apple or to others, cutting grooves and passages into the fruit. They also gnaw many incipient burrows or shallow pits which I have found on July mornings freshly cut. This sort of injury partially heals up, though the bordering peel remains discolored; but the apple is not hastened in ripening by it. Finally, the worm cuts from the shelter of a leaf or even openly on the cheek a round passage *inwards* to the core, not as Harris says *outwards* from the core. The connecting thread-like passage between the slight excavations at the calyx and the large ones at the core, as shown at *b*, Fig. 162, cannot often be found in nature.

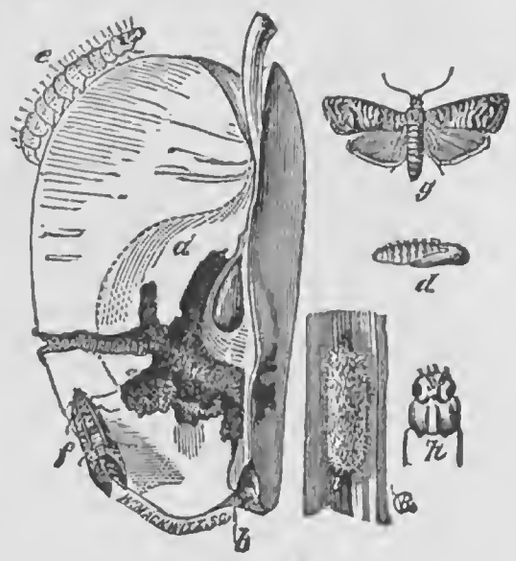

Fig. 162.

Mr. Newman, of England, was the first writer who represented the worm as remaining all the time in the apple, eating towards the core but not touching it till after it had cut a passage to the outer air. And he says, "it must be so constructed as to allow the power of gravity to assist in keeping it clear." Miss E. A. Ormerod, a foremost entomologist of England, has made a drawing of an apple, which, as it were, illustrates this error (Fig. 163) where an apple is shown as growing in this position on the tree—calyx up. She says as the worm grows, "it continues its gallery towards the stem or lower side of the apple, where it makes an opening through the rind, and thus is able to throw ont the pellets of dirt which could not be got rid of by forcing them upwards through its small entrance burrow." The forming of the large burrow as described, and the position in which the apple hangs, seem to be faulty. Besides, there is no need of using gravity, and the burrows do not conform to a use of this power, for the orifice is very often situated above the internal galleries. There is very little refuse or dirt to be disposed of. The worm resorts to the outer surface of the apple quite frequently by day if the opening is hidden by a leaf; otherwise it comes out during the

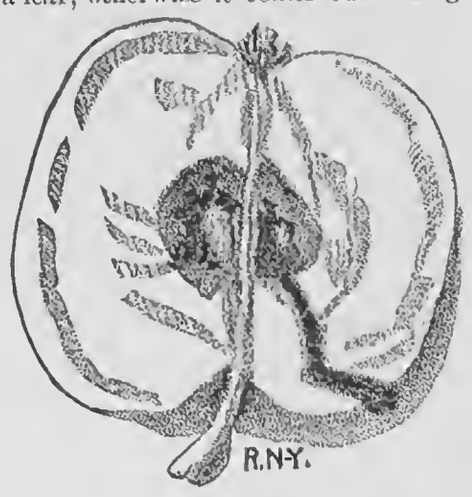

Fig. 163.

night. The castings there ejected adhere in part to the silken threads tied to the leaf or apple. A nearly full-grown worm cuts its burrow from the cheek to the core very quickly. And before the apple is ready to fall, the worm is obliged to crawl out. It can eat no more, and to complete its growth, must spin its cocoon in which to undergo its pupal change. It either drops to the ground by a silken thread, or crawls along a branch to some nook in the trunk.

The final cutting clear through into the core and pips, which always insures and hastens the fall of the fruit, shows that the habit of the worm is to fall to the ground in the fruit, and this is the rule of the first brood. With the later broods on summer fruit, an opposite and more serious dilemma occurs. There the eggs are laid on apples which very soon become ripe, fall, and decay before the worm gets its growth. I find that many harvest apples falling from ripeness, contain each a worm not half grown. These do not attain their growth in that year, but sustain a meager existence in the decayed apples, migrating from one to another. The decayed apples are reduced to mere scraps by last of the following May, and still the worms are feeding in them, sometimes three in a remnant, eating up the last particle, and often some of the pests are devoured by those which survive. These get on the wing very late, and form an intermediate brood, and thus extend the overlapping of the early brood. The last of the eggs laid from this retarded summer brood, bringing, the following year, summer moths, attain only one brood a year, and some of the regular first brood are also restricted to one, while it is quite certain some reach three. The last brood is found at October, picking, in a young stage of growth, in the calyx, or else in under a leaf resting on the fruit, or at the conjuncture of two apples, where the moth sometimes lays the egg. This brood disfigures larger quantities of fruit until then perfect.

Where sheep and swine are given the proper run of an orchard, marked benefits are always observed. Nearly all of the first brood fall to the ground in the fruit, and are devoured. The use of arsenical compounds has proved of great advantage. With the excellent spraying machine now in use, a fine mist of Paris-green water can be distributed to every apple and leaf, so it can be counted an effective remedy. At first it was thought to deter the moth from egg laying on fruit thus treated. Now, it is known egg laying continues as usual, but the minute worm is poisoned with its first morsel of apple peel, filmed as it is with Paris-green. This remedy was used in 1876, and, first announced to the public by Mr. J. S. Woodward, at a meeting of the Western New York Horticultural Society, at Rochester, N. Y. The moth's eyes resemble the butterfly's, and are exteriorly different from those of light-attracted moths, and it cannot be attracted even by an electric light. W. L. DEVEREAUX.

What Others Say.

SUNFLOWER SEED FOR STOCK.—Prof. E. W. Stewart says that sunflower seed is a valuable food for stock if fed properly. The best way to feed to calves is to remove the hulls in a hulling machine and then boil the meats to a jelly. It is, in this condition, a good addition to skimmed milk. Sunflower seed contains 23.6 per cent. of oil, while flax seed contains 37 per cent. The oil is a mild laxative and will keep the coat glossy. Fifty bushels of seed could be raised from 25,000 plants on an acre. This would allow one-half gill to a plant and place the plants in rows 20 inches apart and 12 inches in the row. From an acre of sunflowers we believe the birds would seed the whole township.

A FRENCH METHOD OF KEEPING POTATOES, practiced by country people with the stock for home use and also by hotel and restaurant owners, is described by *La Journal d'Agriculture*. A large vessel of water is placed over the fire and its contents raised to the boiling point. Washed potatoes are placed in a basket or net and quickly dropped into the water, where they are kept for four seconds. Before a fresh lot of potatoes is immersed, the water must be allowed to rise to the boiling point again. Each lot of tubers, as soon as lifted out, is spread on the floor in a well aired place to dry. When all have been treated in this way, they are stored away in a dry, cool place. There is no tendency whatever to germinate, and the potatoes will remain sound and well flavored all through Winter, Spring and Summer until the next crop comes in.

SLAG WOOL.—The production and industrial application of this article are largely increasing in Europe. By the action of strong jets of steam the slag from iron works is transformed into a fibrous, whitish, silicate cotton, which, being mineral, is incombustible, like asbestos. It is advantageously and extensively used in England, we are told by the Builder, in the construction of new houses, especially those with Mansard roofs, the space between the interior panneling and the exterior covering of zinc, slate or tin, being filled with slag wool, the effect being to afford protection from the rigor of frost in Winter, and from intense heat in Summer. It also prevents the freezing and bursting of taps, spouts and water-pipes covered by it, in severe weather. We have not seen any account of its use in this country, but if the claims made for it are true, it will doubtless be introduced here also.

THE UTILIZATION OF FEATHERS of various kinds until lately considered worthless has become a valuable industry in France, as we learn from the *Journal d'Agriculture*. Those obtained from ducks, chickens, turkeys and wild fowl or any birds killed as game, are trimmed from the stems, which may be thrown away. The plumes are then used to make feather cloth or blankets which are exceedingly light and very warm. When separated from the stems, the plumes are put in a bag which is tightly closed, and then they are subjected to rubbing between the hands, as in washing clothes. By this means the fibers are, in a few minutes, separated from each other, and form a perfectly homogeneous and very light down, which by a simple operation can be made into quite a variety of coverings and other household objects at a trifling cost.

BY THE SHORT WAY.

CARE AND MANAGEMENT OF FARM STOCK.—Warren Brown recently spoke to the farmers of New England, who meet every week in Boston, upon the subject of the care and management of farm stock. The Massachusetts Ploughman gives short-hand reports of the proceedings, from which we gather many valable items. Mr. Brown asks: How often shall stock be fed? In his boyhood it was the custom with some farmers to go early to the barn, say at four or five o'clock, and give their stock a small foddering of hay. This practice was followed throughout the day, and up to 10 or 11 o'clock at night, and the cattle were constantly kept eating. He thinks the best farmers feed but twice a day, and by this he means that they can be two or three hours eating, so that the cattle are filled twice a day. He likes to have it all eaten up. His practice has been to give his animals all they could eat. It has not been the question how little to make them eat, but how much. He believes that if cattle are fed plenty of food and then allowed to lie down and rest, it is more for the interest of the farmers than to keep them eating all the time. It is as important to have time to digest as to have time to eat. If they are allowed to lie down all night, they will be more comfortable and will have a better appetite for eating in the morning. But if they are half starved and are constantly expecting something, they are never easy, and in that there is a great loss. Feeding twice a day is a great deal more profitable way of feeding farm stock.....

THEN the cattle should be kept clean. They should stand upon a raised platform so as to be away from the droppings, and should be bedded with sand or sawdust or cut straw or something of that kind in order to keep them clean and give them a comfortable bed to lie upon..... .....

CARE should be exercised that the animals do not become covered with vermin. There is no gain where the cattle are thus covered.

It will take all the feed to keep the vermin. If you will keep infested cattle in your barn, your barn will become infested. Although you should take out the animals and put in others, still within a short time they will be infested like the first. It is a necessary rule with farmers to keep their stock clean. Mr. Brown has found nothing better than carbolic soap. He takes carbolic crystals and puts them in water. If you buy crystals you will get it stronger than you can get any in the market. Take a bar of soap and dissolve it, and put in these crystals, and allow it to become hard. That is as good a preparation as you can get for this use.....

Mr. Brown thinks that brewers' grains and malt sprouts are of great value for feeding stock, forming a very nutritious food. He is in favor of salt hay as a partial food.....

He thinks that the silo is destined to be firmly established and that those farmers that don't "catch on will probably get left."....

Mr. Brown was questioned as to his recipe for carbolic soap. He takes one ounce of carbolic crystals (60 cents a pound) to a bar of soap. He puts the soap (common bar soap) in boiling water and adds the crystals and allows it to cool, when it is ready for use. It will kill the eggs of insects and remove scurf and roughness. It is good for mangy animals and will kill fleas on dogs.....

Mr. Peabody remarked that some kinds of feed will do well for some animals, that will not do well for others.....

He tried an experiment to see the effects of cotton-seed meal. With the cow having two quarts of cotton-seed meal in the place of two quarts of cob-meal, there was an increase of two quarts of milk a day. The other cow did not yield any increase at all. The cob-meal did as well for her as the cotton-seed meal....

Mr. Hawkes said that all the different grains are fed in his section. Some of the farmers use rye and find it excellent feed for milch cows.....

Mr. Cheever was obliged to leave his home, and the care of his herd of 30 polled cattle was left to a hired man. When any cow had grain left he would give it to another. There was food before them all the time. They lost their appetite and became thin. Before Mr. Cheever had time to improve the cows by proper feeding, he was obliged to sell them. About two-thirds were in poor health and condition. He thinks it very necessary to give cows no more than they can eat with relish...

Mr. Brown thinks that there is little advantage in cutting hay unless it is both cut and steamed. He thinks the silo has taken the place of this method. He feeds malt sprouts steamed, in connection with silage and salt hay and nothing else .....

Mr. Ware commenced the use of silage when nothing was known about it. He fed a herd of thoroughbred Ayrshires two years in succession and they did not get any hay. He wanted to see whether the silage would kill or not. But the cows appeared to be in perfect health all the time.....

Mr. White made the remark that to be a true gentleman you must be a gentleman in the presence of your hens, cows and horses...

Mr. White mentioned the case of a farmer who lost three or four calves by premature birth. It was attributed to a broad stone, the surface of which was an inclined plane.....

Mr. N. Osborn, of Newington, Conn., reports in the N. E. Farmer, his success in bringing up poor land by the use of the Mapes fertilizer. Seven years ago the land would produce nothing but Pigeon Grass and dewberry vines. The profits on seven acres for six years figure up $685.85, beginning in '80 and '81 with a profit of $50 for each year, and ending in '85 with a profit of $220. Last year the piece yielded 18 tons of hay worth $15 per ton. The most fertilizer used in any one year was three tons, costing $150. Seven years ago the land was worth practically nothing; now it pays a dividend of 5 per cent on $4,000.....

San Antonio, Texas is one of the largest horse markets in the country, though the majority of horses handled there are from the ranges, and therefore, small, unbroken and shaggy, but with plenty of bottom. Last year the total number sold was 45,355, for which $1,133,965 were obtained—an average of $25 per head. It is probable the sales will be larger the present year; and the use of better stallions is steadily improving the stock.....

Farmers near Kankakee, Ill., have opened a farmers' club room, where they may come together and learn prices and compare notes. All the best agricultural papers are to be kept on file, and home and foreign crops and markets carefully bulletined. This is a good move. In such a room farmers can learn from the experience of others. It will be a much better place for waiting than the store. They can find out who has for sale, or wishes to buy, stock, seeds or other produce. It is a good move, and we hope to see other communities follow in the work.....

A lightning rod which does not go down into the ground far enough to reach perpetual moisture is worse than no rod at all.....

Never try to stimulate man or bird or beast. A hen filled with "egg producer", or a cow given more food than she can digest will go like a man kept on whisky. There will be brilliant, feverish work for a time, and then a grand collapse.....

Don't disfigure your grounds with laths or slats when wire netting is so cheap, says the Homestead. A netting inclosure is durable and will not be blown down in any wind.....

The hens are paying the rent on many a worn-out farm. They are calling people back from the factories to the deserted farm-houses. The American eagle will yet be a hen if solid worth is ever counted.....

A Connecticut farmer, quite unexpectedly, grew a tremendous corn crop last year. The land was in grass the previous year, heavily manured with horse manure after haying, and then plowed. It was manured in the Spring with hen manure and superphosphate. The idea was to fit the ground for a future onion crop, and not to particularly benefit the corn. But the corn stole more of the plant food than was expected. As the N. E. Farmer says, there is a valuable lesson here.....

Mr. Houldette says that nothing will give a fowl scaly legs so quickly as sitting down or walking over the droppings, which should be removed at least twice a week.....

Suitable food and lodging; regular hours of labor; freedom from nagging, ridicule and the annoyance from his employer's saucy children; considerate treatment generally; prompt payment of wages according to agreement, are the rights of the hired man, according to R. J. Fleming.....

If you feel murder in your soul and must kill something, attack the English sparrow. Thus quiet a deplorable inclination and help mankind at one shot.....

At the recent poultry meeting, well reported in the Ploughman, the general opinion seemed to be that the color of an egg, as well as its quality depends upon the food given to the hen. Corn will give a darker yelk than oats. Lobsters color the egg almost red. Green food will color eggs. Onions or sulphur will give their characteristic tastes. A good judge can tell from the taste of the egg what his fowls have been eating. Just as certain foods make poor butter, so some foods produce inferior eggs.....

Mr. Felch compares Brahma eggs to Jersey butter. He thinks five Brahma eggs will make as much custard as eight Leghorn eggs. As tested at his table the difference was quite evident. Mr. Hawkins thinks Mr. Felch has been brought up to like Brahma eggs, and therefore thinks he can tell them.....

A Prairie Farmer contributor proposes to keep moles in check by clean cultivation, and encouragement of hawks, skunks, owls, cats and dogs. Clean cultivation is good, but the next three members of the combination are as bad as the moles.....

If the hay ran short and the cattle are thin and poor, remember to use caution in letting them into rich pasturage.....

A fat, "puffy" bull is a nuisance. Don't let a bull over-feed. Give him plenty of exercise. He never will be fit for service if you pamper him. If you can fit up a harness for him, and make him haul out the manure and do other light jobs, you would be doing business-like farming .....

Sam Jones said he would assume dignity after he died. The N. Y. Tribune thinks he got this effective illustration from a contemplation of the New York State Agricultural Society.....

Too many fowls have to depend upon the contents of the wash-tub for drinking water. The dirty soap suds will be sure to cause disease. Give the hens pure water.....

Mrs. G. H. Hollister to induce hens to leave off sitting, makes them hunt their own feed. She makes them fast for 24 hours, and then forage. This plan works well. The third time seldom fails with the most motherly of hens. Better than tying by one leg, or making them stand over sharp nails.....

C. H. Parsons states, in the Homestead, that he hopes to feed 30 tons of cotton-seed meal. He sells his hay, and feeds corn-stalks and roots. The meal will not only make beef, but will leave its impress for a year upon his soil and crops.....

What is education? asks Dr. T. H. Hoskins. It is the "know how." Do farmers need education? Oh, no. Farming is such an easy business, and yields such immense profits, that ignorant men can get rich at it as easy as falling off a log.

SILKS & VELVETS.

JAMES McCREERY & CO.

are exhibiting complete representative lines of their SPRING IMPORTATIONS in BLACK and COLORED SILKS, VELVETS etc., with the latest and most select designs in Rich NOVELTIES to match for COMBINATIONS and GARNITURES. They also offer a great selection of Fancy Silks in Glace Checks Louisiennes, FOULARDS, TRICOTINE IMPRIMES, etc., at a very marked REDUCTION in PRICES; also a lot of Rich Silk and Silk and Velvet Novelties in various designs, at about half their cost of importation.

RURAL SPECIAL REPORTS.

California.

SANTA CLARA, Saratoga, March 24.—California orchards and vineyards seldom have a garden attached to them, sometimes not even so much as a common rose bush near the house. Vegetables are looked upon as a nuisance and an expense—a nuisance because they invite insects such as "Diabrotica 12-punctata," which were last year and again about six years ago, very destructive to the fruit. I am an advocate of vegetables in the orchard, among young trees or those of slim shape, like the pear. A garden would seem to urge one to cultivate well and manure the soil, and if carried on properly would be a benefit rather than an injury to the trees. And if bugs do come, is it not easier to destroy them on vegetables than up on fruit trees? The Italian fruit and vegetable gardeners travel all over this fertile valley every day of the week selling to every farmer and orchardist such "truck" as could and ought to be grown around every farm-house. Besides the vegetable garden for the "folks," I am growing corrots, mangels and turnips for the stock and poultry, and hope to succeed in making my neighbors do the same. I manage an orchard of 85 acres in full bearing. P. L. H.

Kentucky.

GREENVILLE, Muhlenberg Co.—The past Winter was the most severe ever known here—snow 15 inches deep on a level, and high wind all the time. Young stock injured; poultry on many farms all frozen to death. During most of the Winter the snow protected the wheat; but lately, after a severe thaw had exposed it more or less, alternate freezing and thawing injured it to some extent; but the outlook for a good crop is better than for years at this season. Peaches will be a failure, as a large proportion of the young trees were killed to the ground. So were raspberries and blackberries. Farm work going on lively. Tobacco is absorbin most of the farmers' attention. D. B. S.

Missouri.

ELDEN, Miller Co., April 1.—Although we have had some warm days, yet Spring can hardly be said to have fairly opened. Some oats have been sowed, but not all, although it it is getting late. Some garden has been made, and early potatoes have been planted. A few who sowed no oats have commenced plowing for corn. We will have very few peaches, but prospects are fair for other kinds of fruits. Winter wheat looks very well, and as the worst danger—freezing out—is past, the prospects are good for a fair crop. N. J. S.

New York.

APALACHIN, Tioga Co.—A heavy rain last night accompanied by high winds, has settled the ground to quite an extent. To-day the wind is still blowing, warm; and by next week the plow will be started on dry soils. Small fruits are looking well. Raspberries not killed back to any amount; but the heavy snow in the forepart of the Winter, broke down numerous bushes of the red varieties. Wheat begins to look green; prospects of a fair crop. Potatoes are the principal crop for farmers about here; price 40 cents, with quite a good many in growers' hands; there was a time in January, when farmers received 60 cents for their tubers, but that figure has not been reached since. Wheat, 90 cents; oats 40 cents; cows $30; horses $125 to $225. C. F. G.

Tennessee.

OAKLEY, Overton Co., March 22.—The cold the past Winter did more damage to growth in this section, than in any winter in my knowledge. Many young peach trees, as well as many kinds of perennial shrubs were killed. Not a peach bloom will probably appear in this section—Northeastern Middle Tennessee. T. W. C.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

GAS LIME.

E. R. G., Ballville, Orange Co.—1. The value of gas lime as a manure would depend a good deal upon the effect lime has on the soil of your farm and the price at which fresh lime can be bought. It is not worth more than one-fourth the price of fresh lime. 2. It is not to be recommended for mixing with hen or pig manure to be put in the hill with corn. If you have muck handy, it may be mixed with that to good advantage when it is being piled. As it comes from the gas works, it is poisonous to vegetation, and unless you have muck to mix it with, we would prefer to scatter it in Fall upon grass land to be plowed in Spring, or upon raw land to be harrowed or cultivated in Spring. Try it sparingly and watch its effects. The safest plan, however, is to expose it to the air for two or three months; thus weathered, it may be applied without injury.

ESCUTCHEON ON COWS.

Several subscribers.—The hairs just above the udder of cows grow transversely or upwards. This growth of hair Guenon calls the escutcheon, and he asserts that the more the upward growth of the hair extends outward from the udder and the inner parts of the thigh and the higher towards the urinary passage from the bladder, the better milker the cow is, and just as the upward growth of hair fails to extend upward and outward in these directions, so much the less likelihood that the cow will be a good milker. This is the principle of the escutcheon, but there are several modifying conditions, and a full discussion of the rather intricate theory would occupy too much space here. An illustrated little book fully explaining the matter, written by Willis P. Hazzard, is published by J. M. Stoddard, 627 Chestnut Street, Philadelphia, Pa., price 50 cents, in paper; 75 cents in cloth. "Gueuon on Milch Cows," 75 cents, another work on the subject, can be had through the American News Co., of this city. The regular dairy books, such as Willard's Practical Dairy Husbandry, and Sheldon's Dairy Farming, also discuss it at considerable length.

BLOOD SPAVIN AND RING-BONE IN A HORSE.

C. E. E., Canton, Ill.—1. For blood spavin in the hind leg of that afflicted young horse, in the early stages cold water persistently applied, followed by cooling lotions—equal parts of alcohol and rain water, or a pint of brandy to half a pint of water — will usually be enough. If not, apply an infusion of bayberry bark, using considerable friction in rubbing it in by the hand; use also either of the other remedies. This sort of spavin, if not connected with bog or bone spavin, is harmless. It is often, however, an indication of other diseases of the joint. 2. For ring-bone on the fore leg of the horse, engage a regular veterinary surgeon to fire and blister the affected limb at once, and give two months' rest—at grass as soon as the pasture is fit. If any lameness remains, repeat the operation. If there is no competent surgeon at hand, after clipping the hair short, apply the following ointment, with friction: Cantharides powder, half an ounce; lard, three ounces. Secure the animal so that he cannot get his mouth to the blistered limb. Give rest as in firing, and repeat if necessary.

DESTROYING CANKER WORMS ON APPLE TREES.

J. L. K., Rochester, N. Y.—1. If the canker-worms that have been thick on my apple trees for two years are not destroyed, will the trees be? What is the best way to get rid of the pests? It isn't easy to apply Paris-green to trees 20 feet high. How long will the rascals remain in an orchard? If trees are sprayed with Paris-grass, will not the grass under them be dangerous for grazing stock?

ANSWERED BY PROF. A. J. COOK.

The trees will soon be killed unless the canker-worms are put to route. The first year they injure the trees, which are often nearly or quite destroyed the second or third years. They usually remain in an orchard once attacked till the orchard is all destroyed. I have known many such cases. The Paris-green remedy is so much cheaper and more effective than others that I think it alone is worthy of adoption. By the use of this method, we will also kill the very harmful leaf-rollers, and also the worst enemy of the apple grower, the larva of the codling moth. The trees should be sprayed soon after the leaves show, as the canker-worms are but little behind the leaves in time of appearance. I use one pound of poison to 50 gallons of water. Place this in a barrel in a wagon, and syringe by use of a force pump and spraying nozzle. It is a sure remedy. Of course, some poison falls to the grass under the trees; but if stock is kept out of the orchard for two or three weeks, all danger will be at an end. I would keep stock out till after a heavy rain storm had occurred.

GRASS FOR A STEEP ORCHARD.

A. S., Beechwood, Pa.—On a southeast-facing hillside, a trifle too steep for cultivated crops, on which I intend to plant apple trees, what grass would be best, and what should be the treatment?

ANS.—It would be best to seed it down to June Grass (Poa pratensis) and White Clover without grain, and set the trees as much as possible in depressions that will catch the rain as it runs down the hillside. It is not necessary, or any way advantageous, to set the trees regularly on such a location. An orchard set in grass should be neither pastured nor mown for hay. The grass should be cut at haying time, or a little later, and raked up around the trees as a mulch. As this mulch, while greatly benefiting the trees, harbors mice, the trees should be protected by tying pieces of lath, or barrel-staves around each. These strips should be 1½ to 2 feet long. The lower ends should be pressed a little into the soil, and one turn of strong cotton twine near the top is enough. It is not necessary to remove them in the Spring, but in the Fall turn all the pieces inner side out, and tie again, so that the birds may clear them of the codling moth larvæ which harbor there in great numbers. In such an orchard there is no need of plowing the ground after it is once seeded, and it would be disadvantageous to do so, as it would favor the washing away of the best part of the soil in heavy rains.

LUMPS ON A COW.

J. D., Ivy, Kans.—Some time ago a small lump appeared on the neck of a cow; when ready to burst it was opened, and emitted considerable thick, yellow matter. Now there is in the place a wart-like excrescence the size of a hen's egg. There are several others also—one on the shoulder, three on the jaw, one on the other side of her neck, and some are beginning to resemble the early stage of the first: what should be done for her?

ANS.—Give internally, twice daily, one ounce each of the sulphate and bicarbonate of soda, and one-half ounce each of powdered gentian and ginger. The diet should be nutritious and laxative. Use the card daily, allow out-door exercise when pleasant, and at other times a clean, dry, airy stable. We would not care to use the milk except in a case of necesssity, although it is probably unaffected, and can be safely used.

A STARVING COW.

S. B., Pequanock, N. J.—For the last six weeks my ten-year-old cow has been falling off in flesh. She calved five months ago, and I have milked her since. She has had corn-stalks and second-quality hay, all she would eat, with a mess of corn-and-cob meal made into a slop, per day. I have just discovered that she is troubled with "wolf-in-the-tail"—the bone in half the tail appears to be all gone—is this the cause of the trouble? If not what is and what should be done?

ANS.—No. If the tail is relaxed or softer than usual it may be the result of disease, but it is *not* the *cause* of any disease. The symptoms would indicate nothing more than an insufficient quantity of suitable food. In other words, the cow is slowly starving. Feed more liberally. Mix equal parts of ground oats, corn meal, and wheat bran, add one-fourth part of oil meal. Feed six quarts twice daily. Read "Feed for milch cows" in the F. C., of March 6.

WATER-PROOF MUSLIN, ETC.

T. H. Y., Alexandria, Dak.—1. To make "factory" water-proof for cold-frames, thin unbleached muslin should be tacked tightly over a frame to fit closely to the hot-bed. Into a pint of linseed oil, unboiled, beat one egg thoroughly, and with a paint-brush, free from paint, give a coating to the top side of the muslin. At night, or when cold, spread an extra cover over the hot-bed. 2. We do not think that any mode of trimming melons will hasten ripening. Melons *must* have *heat* and in the absence of the needed amount, we do not believe that any manipulations will help them to ripen earlier. All we can do is to give them a warm situation, plenty of food, and be careful not to crowd the vines.

Miscellaneous.

E. G. B., Dover, Del.—1. Where can I get mineral paint? 2. What proportion of oil and drier should be mixed with it when dry? In mixing white lead, what proportion of linseed oil, Japan and turpentine to 100 pounds, is best for outside work? 4. Where in New York can I buy crude petroleum by the barrel? 5. Is the Leaming Corn good for Northern New Jersey? 6. How long will linseed and cotton-seed meal keep stored in a barn?

ANS.—1. At any paint store and at most grocery stores. 2. One gallon of oil to seven pounds of dry paint. No drier is required. We have tried cheaper oils than linseed, but would not advise their use. 3. About nine gallons of oil and one of turpentine. 4. Of J. Macbeth, 128 Maiden Lane, New York; or of the Prince M'f'g Co., 71 Maiden Lane. It is worth about 12 cents per gallon by the barrel. 5. The Leaming is good, but not so early as the Pride of the North, Longfellow or Angel of Midnight. 6. That will depend largely upon its condition and surroundings. If the temperature is high and the air moist, it will keep only a short time, while under favorable conditions it would keep a long time.

W. A. P., Brookfield.—We do not wish to give the names of dealers who buy the bodies or skins of dead birds for ornament. We are opposed to the traffic, and decline to help the traffickers, even at the solicitation of one "who approves the stand taken by the RURAL on the matter." A "little knowlege is a dangerous thing" now and then. "Do you ever grease the oats for the horses?" asked the priest, in the confessional, of "'Ostler Pat." "Faith, I don't; why should I?" said the penitent. "Because they couldn't eat them so well, and there would be more for you to steal and sell," said the priest. The very next time and every time thereafter the principal sin Pat had to confess was that of greasing the oats for the horses.

J. A. C., Birch Run, Mich.—Stumps are burned out, dug up by hand and by means of a machine, or blown out with powder or dynamite. The "best way" to remove them must depend upon the value of the land and the contents of the owner's pocket-book. A stump-pulling machine will be of little value when the work is done. Hand digging and burning can be done at seasons when other work is not pressing. Explosives make short work of the stumps, but they are rather expensive and considerably dangerous in the hands of anybody who is not accustomed to their use. We do not know of any book devoted to this subject. Several articles have appeared on it in back issues of the RURAL.

E. C. S., Taylortown, Va.—My three-year-old heifer had a calf when 13 months old, and has not been in heat since. She seems to be so; but will not let the bull approach. What should be done?

ANS.—When she appears to be in heat, hold her for the bull. Failing in this, you can do nothing.

J. M. V., Woodbine, Ia.—To get rid of lice on hogs, wash the animals all over with crude petroleum, and next day give a thorough washing with warm soft water and soap, using the scrubbing brush freely. This is just as good and easy a way to destroy lice on hogs as any of the 999 others.

DISCUSSION.

REMEDY FOR CABBAGE MAGGOT.

C. E. P., QUEENS, L. I.—IN the R. N.-Y for April 3d, page 219, I notice that "Horticola" offers a remedy for the cabbage maggot, and as this pest appears to be unusually destructive of late, I think its ravages should be prevented in time, and before it has had any opportunity to damage the crop, especially when the preventive can be employed before the crop is planted. The remedy I have to offer consists in scattering in the hills, and thoroughly mixing with the soil, a small quantity of any concentrated cabbage fertilizer. In this vicinity cabbage is very extensively and profitably grown as a market crop, and I have yet to see a field injured by the cabbage maggot, or by what is known as club-foot, where any good concentrated cabbage fertilizer has been employed, and but very few would think of planting cabbage unless they prepared the soil as above advised. No matter how rich the land or what amount or quality of stable or barn-yard manure is used for the crop, always use a little good fertilizer. It will not only prevent the attacks of many insect pests at the roots of the plants, but add very materially to the quality of the crop.

L. E. B., ROCKWELL CITY, IA.—At the Iowa State Agricultural College three species of Forsythias are grown. F. viridissima, as figured in the RURAL, is a fast grower, has shining, dark-green, lanceolate leaves; is not at all hardy, being killed to the snow-line each Winter. It has not borne any flowers. F. Fortunei makes a fair, healthy growth; is medium-hardy, and *might* be good in favorable locations. There is another, not figured in the RURAL, which is yet better than the two above mentioned. Its specific name is F. suspensa. The leaves are much like those of Fortunei except in being more broadly ovate and even. This species is quite hardy and makes a good, though straggling, growth. It is peculiar in that the lowest branches recline on the ground; the tips then push along a short distance and take root.

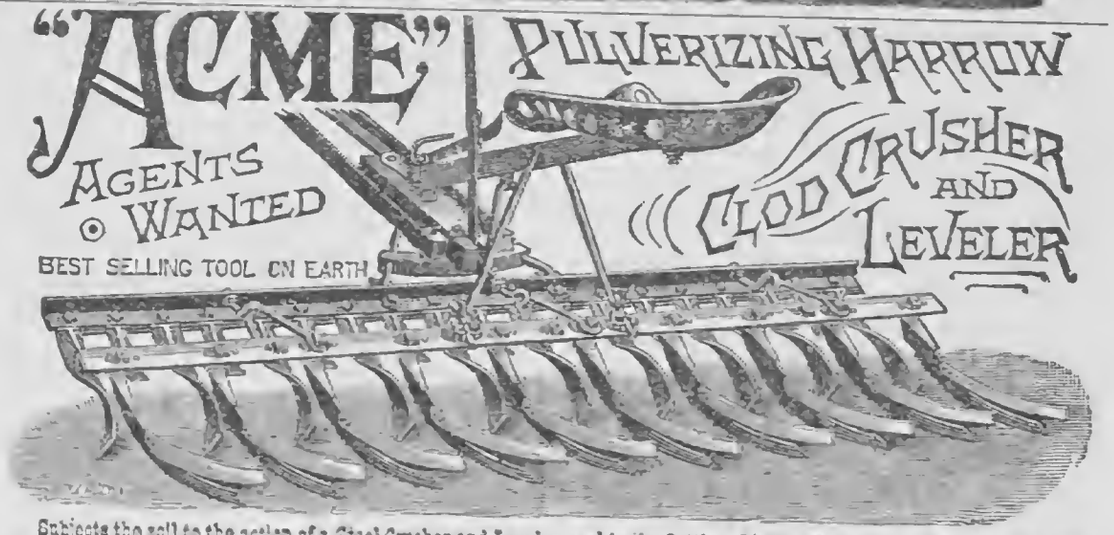
"ACME" PULVERIZING HARROW

AGENTS WANTED.
BEST SELLING TOOL ON EARTH.
CLOD CRUSHER AND LEVELER



Subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning Process of Double Gangs of Cast Steel Cutters. Immense cutting power. Crushing, Leveling and Pulverizing performed at the same time. Entire absence of Spikes or Spring Teeth avoids pulling up rubbish. Only Harrow that cuts over the entire surface of the ground. Sizes, 3 to 15 ft. wide. With and without Sulky attachment. We deliver free at Distributing Depots.

FAIR PLAY. **DO NOT BE DECEIVED.** Don't let dealers palm off a base imitation or some inferior tool under the assurance that it is better. SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL. We will send a **double gang** Acme to any responsible farmer in the United States; if it does not suit, he may send it back, we paying return freight. We don't ask pay until tried on his own farm.

Send for pamphlet containing thousands of testimonials from 18 States and Territories.

Branch Office,

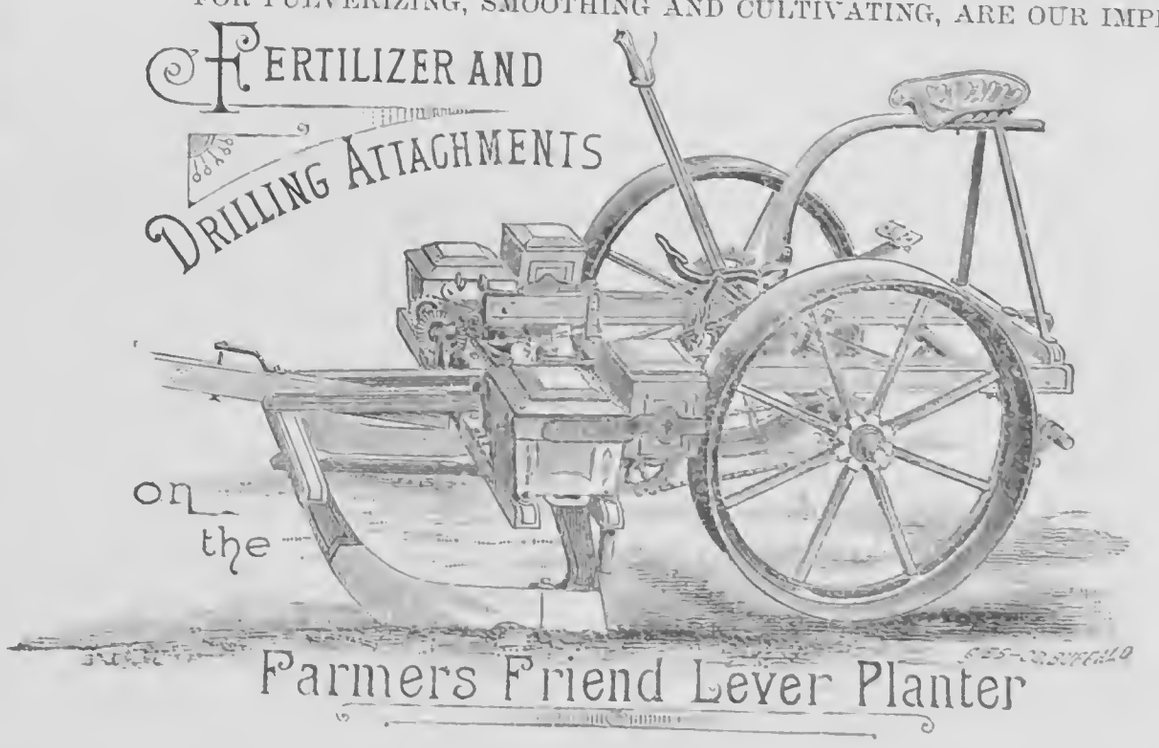
MILLINGTON, NEW JERSEY.

N. B.—"TILLAGE IS MANURE" and other essays sent free to parties who NAME THIS PAPER.

FARMER'S FRIEND M'F'G CO.,
DAYTON, OHIO.
CORN PLANTERS, CHECK ROWERS, CORN DRILLS
AND THE
"EXCELSIOR" LEVER FOLDING HARROW
FOR PULVERIZING, SMOOTHING AND CULTIVATING, ARE OUR IMPLEMENTS FOR SPRING USE.



WE ALSO MAKE

2-Horse Corn Planters,
2-Horse Corn Drills,
Fertilizer Corn Planters,
Wire Check Rowers,
1-Horse Corn Drills,
Fertilizer Corn Drills.
2-Horse Grain Drills.
3 and 5-Hoe Wheat Drills.

Our Planters and Corn Drills are recognized as the best in all the Corn States.

Circulars, Cuts and Prices Free.

Supply Houses in all parts of the Country.

We sell to responsible farmers where we have no agents, and ask no pay until satisfied.

Farmer's Friend M'f'g. Co.,
DAYTON, O.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, APRIL, 17, 1886.

IF the number on your address label is 1890, your subscription expires with this number; if 1891, next week; 1892, in two weeks, etc.

MR. J. W. JOHNSON, of Ontario, Canada, writes that he harvested over 800 bushels of potatoes last season on less than one acre of land, grown by the RURAL'S trench-flat-culture system. "This is more than double any previous yield" adds Mr. Johnson. The kinds were Pearl of Savoy, Clarke's No. 1, White Star and Rural Blush.

WE shall not present many pictures in our Poultry Special. Portraits of nearly all the valuable breeds have been published and republished so often that we dare say our readers are familiar with them. Our aim is to give, in a condensed form, all needed information regarding the best breeds and the best management of poultry; to show whether poultry-raising is profitable; in how far, and under what conditions it is profitable.

WE do not intend that our Special Poultry Number shall be written in the interests of professional poultry dealers or fanciers, or to puff up any breed, incubator, patent contrivance, special foods, medicines or anything of the kind. What we desire is that it shall help the farmer to make poultry keeping more profitable. We have always thought that the average farmer does not give to his fowls the thought and care that he might give advantageously.

NOTICE.

ALL potatoes and living plants to be tested, should be sent to River Edge, Bergen Co., New Jersey, and not to this office.

WHEN complete chemical fertilizers are used without increasing the crop, this is no proof that the fertilizers were ineffectual. It is proof that the soil is already abundantly supplied with plant food—and "enough is as good as a feast." To test the effects of fertilizers, it is better to select a poor soil. Our first experiments were made at the Long Island Rural Farm years ago. We used every kind of fertilizer and every combination of them without ever ascertaining that one kind was needed more than another, or that they were needed at all. The reason, no doubt, was that the soil was already fertile. Upon the New Jersey plots, which have been impoverished by years of cropping without any adequate return of plant food, we cannot raise a profitable crop of anything without fertilizers or farm manure, and, so far as we can judge, the one answers just as well the other.

ON Wednesday, Senator Wilson's bill doubling the postage on fourth-class matter, received a contemptuous kick in its original birth-place—the U. S. Senate, where the Committee on Post Offices ordered an adverse report on it. This kills once more what was killed a month ago in the House. The "old-fogy" Senate is always much slower than the House in responding to public sentiment on all matters of public interest. It is the oligarchical representative of the States, not, like the House, the democratic representative of the people. Its members are, for the most part, either the paid attorneys of railroads, national banks, and other wealthy and unscrupulous corporations, or the direct representatives of such bodies, or millionaires who owe their seats more to their money than to their intellect or popularity. But even such a body, although only indirectly representing the people, could not venture to disregard the emphatic expression of public disappropation, even in a matter where the interests of corporations were in conflict with the interests of the people. After all, it is the people who still rule in this country whenever they leave no doubt as to their wishes in matters of legislation.

ANY of our readers may try this experiment without much trouble or expense, while it may prove of great service to them in ascertaining the effects of special fertilizers, or what kinds their soil most needs. Take, for example, two rows of corn. After the seed is planted and before it sprouts, sow upon them for any distance, say 30 feet (it may be less or more as desired), a quantity of wood ashes or sulphate or muriate of potash. Then, skipping six feet, sow fine raw bone flour for the next 30 feet. Again skipping six feet, sow upon the next 30 feet both of them. Upon a fourth 30 feet, add nitrogen to the potash and bone, forming what is known as "a complete fertilizer." This we have done at the Rural Grounds for several years with the result, as published, that the complete fertilizer gives us nearly twice as much grain as either the bone or potash or both combined. The nitrogen may be in the form of nitrate of soda, sulphate of ammonia or blood. We think that any of the leading fertilizer firms would furnish the ingredients in small quantities for such experiments.

SPECIAL.

Those who, having applied for the Rural's present seed distribution prior to April 6th, have not yet received it, will kindly notify us by postal at once.

How many farmers ever write to their Representative urging him to support or oppose pending legislation? Few we fear, yet we think the list could be very profitably increased. The common people make and unmake the legislator. It is well for the latter to keep this fact in mind. He is selected to execute the will of the people. When he gets tired of doing this and wants to put his own judgment against the wishes of those who have made him, it is well to let him try to re-elect himself. Never write to your Congressman about unimportant or trivial matters which he cannot possibly change or bring about. Find out what legislation will be likely to need his vote. If you see anything that is of special importance to agriculture, notify your "political agent" that you expect him to favor it. If he is on the right side when the vote is taken, remember him at the next election. If he goes against the measure, remember him still more carefully. Our political system needs cleaning. We can all help in the work. Begin with the Representatives. Let them understand that they are to stop working for themselves when they enter the employment of the people. A well cultivated memory taken to the ballot box a few times, will wonderfully help the cause of the farmer.

THERE are hundreds of workmen in our large manufacturing towns, so situated that they can do considerable gardening. A good mechanic is reasonably sure of a permanent job. In Summer he has a fair amount of time for himself. Any intelligent man can find far more pleasure and rest in the training and cultivating of fruits and flowers than in lounging about the town talking with his comrades. We know of mechanics, who, on their little garden patch, have raised plenty of small fruits for their own table and sold a considerable quantity to their neighbors. Better than this, they have originated new seedlings of great promise. There are hundreds who might profitably follow their example. There is an increasing demand among workmen for shorter hours of labor. If labor is to be shortened, the profitable disposition of the added hours of leisure will make an interesting study. What shall be done with our time? Intelligent workmen in the smaller cities and towns will be quick to appreciate the advantages offered by gardening, bee-keeping or poultry raising. Work in these branches will never interfere with their skill as craftsmen, while they will be able to reduce household expenses and increase the income by a trifle, and thus work into the sure track that leads up to a home of their own. Labor societies would do well to encourage this home building among their members. Manufacturers could do nothing more profitable than to surround their factories with a community of small land owners, who would have a double interest in the success of the town and its business. The true solution of the labor question will be found in just such a community.

WANTED—BRAINS AND PUSH.

HORACE GREELEY once said "There is something to do everywhere for him who knows how to do it." If this statement ever applies, it will apply now in these days of overproduction and starvation prices. What shall the farmer raise that will pay him a good profit? No! the case is not a hopeless one. There are still opportunities. All the oleomargarine, butterine and suine have not yet destroyed the market for genuine gilt-edged butter. A friend who lives more than 50 miles from any city, retails all the butter he can make on a 60-acre farm at 40 cents a pound. Hundreds of other farmers could doubtless do as well had they but the will and the skill. Many, if not all, of our large cities are as yet poorly supplied with that most delicious vegetable, the cauliflower. Brains, manure and a little land will produce this vegetable in abundance. The skill is not difficult to acquire where there is a determination to succeed. A few weeks ago a Massachusetts strawberry grower gave us some bits of experience. He had been in business, we believe, our seasons. His friends and neighbors all discouraged him at the beginning, insisting that there was no profit in strawberries. But he went to work with a vim. He used plenty of manure, and grew first-class fruit. He never allowed a poor berry to go to market, and never used a basket a second time. The result was that he soon gained a reputation for fancy fruit and had no trouble in disposing of his crop at fancy prices. This is not all that might be said. The rearing of lambs for the early market is proving profitable to those who understand it and attend to it thoroughly. The right man might make a fortune growing mushrooms near almost any of our large cities. After all, there is more in the man than in the business.

SHALL WOOL GO ON THE FREE LIST?

THE tariff bill of 1882 made such a reduction in the duty on imported wool that the sheep husbandry of the country, according to those engaged in it, has suffered severely ever since. Free-traders have all along insisted, however, that while the producers of manufactured goods are benefited by a protective tariff, the producers of raw materials, and more particularly of wool, ought to be benefited by free trade in the goods that compete with their own! The Morrison bill, introduced in the House a few months ago, had the negative merit that, while it did not raise the duty on wool as wool-growers desired, it made no material reduction in the duties imposed in 1882. The Hewitt-Morrison bill, a mongrel concern resulting from a union of certain provisions of a tariff bill lately introduced by manufacturer Hewitt of this city, with some of those of the old Morrison bill, places wool, hemp and flax on the free list, and the measure is likely to pass the House, but its success is doubtful in the Senate. There would be no doubt whatever about the defeat of the measure, if the farmers of the country would do their duty in urging the representatives from their States in both Houses of Congress to vote against it. This should be promptly done, not only by those personally interested in sheep husbandry, but by all others. "What affects one is the concern of all" is an excellent motto of the Knights of Labor; why shouldn't it be also applicable to farmers, whose interests, as affected by national legislation, are nearly all identical. Those who may be forced to abandon sheep raising, will have to take up some other business, and thus come into keener competition with those engaged in other agricultural vocations. No selfish consideration, however, should be needed to stimulate farmers to protect at so little cost of time, labor or cash, the threatened interests of their fellows.

THE RURAL'S WHEAT-RYE HYBRIDS.

IN a recent article in Science Dr. E. L. Sturtevant, the energetic Director of the N. Y. Ex. Station, states that the evidence of our having produced true hybrids between wheat and rye is open to "grave doubts." He does not question the "attempt at a cross." "The variability," he says, "is indicative of a foreign pollen." But he thinks that under the "stimulus of the rye pollen, *atavism* has resulted, whereby varieties dormant in the wheat plant have made their appearance."

Dr. Trelease, of the Shaw School of Botany of St. Louis, Mo., also expresses the opinion based on the *pictures* which he has seen of these hybrids, that evidence is wanting of an actual cross.

We would remark that heads of several of these varieties were sent to a number of eminent botanists several years ago, all of whom accepted them as actual hybrids. A few days ago we again sent a head to Dr. W. J. Beal, of the Michigan Ag College, our first authority on grasses who replies as follows:

Editor RURAL NEW-YORKER:

Your recent letter arrived containing a spike of your hybrid wheat and rye. You may remember that some time ago, soon after maturing, you sent four spikes, one of which was sterile, the others fertile.

I have been looking them all over.

I, of course, know nothing about how careful you were in removing the pollen before mature, and in isolating the flowers.

As I understand *atavism*, it is the recurrence of the original type of species in the progeny of its varieties, or the reappearance in animals or plants of traits belonging to their remote progenitors, which their immediate parents did not present. It is strange that your specimens, so many of them, should all of a sudden assume these forms, as they would if it were a case of atavism. Perhaps we do not yet know what a hybrid is, but from my stand-point, I cannot see why you have not as clear a case as anybody on record. If these are not good evidences of hybridism, then I know of no instances in the Vegetable Kingdom. I cannot see how any botanist can doubt it who looks over your specimens. It seems to me that your Armstrong seed was fathered by the rye, call it what you will.

W. J. BEAL.

Ag'l. Coll., Mich., March 29, 1886.

BREVITIES.

WE are asked to give an opinion as to whether different kinds of peas when planted and blooming together will mix. Our opinion is that they will not mix.

ARE stored potatoes still rotting in your neighborhood? Is the stock on hand large? What are the range and prospects for prices? A prompt answer would oblige many inquirers

SET an asparagus bed—or, sow the seeds. The latter is the cheaper way if one doesn't mind waiting a year longer. Seedling plants are always stronger and will produce larger shoots than sets from old plants.

WE hope that our readers who intend to transplant trees will bear in mind this one simple piece of advice: Don't expose the roots to the wind or sun for an instant, or any longer than is absolutely necessary.

THE laws of morality are the same in all places. What is a fraud in America is also a fraud in England. How one special form of fraud is regarded there is well told by Prof. Sheldon in his article on "Bogus Butter" elsewhere in this issue.

ALL of our subscribers who have not done so are requested to apply for the Seed Distribution at once. In previous years we have received many letters to the effect that it was not received. We hope that the present year may prove an exception.

WE have never been very successful in keeping our celery after the middle of March by the usual methods. One of our neighbors has been very successful this season by what to us is a new plan which we shall place before our readers in due time. Meanwhile we shall be glad to hear from our readers on the subject.

LAST year we planted 100 roses of the more tender varieties, such as Teas, Bourbons and Noisettes, commonly known as "ever-blooming or monthly roses." In early Winter the stems were laid over and covered with leaves, and upon these an inch or so of soil was placed. We now find that all are alive. This protection may be given with little trouble, and in this way we secure their delicate beauty, fragrance, range of color, and frequency of bloom, with the sturdier and somewhat more restricted charms of the hybrid perpetuals.

THE distress in Great Britain—agricultural and manufacturing—last year, caused a considerable decrease from 1884 in the drink bill of the "tight little Island." The bill paid, however, reduced as it was, still equaled the nation's outlay for bread, butter and cheese: was nearly the same as the total sum of all the rents paid for farms and farm houses; was three times the amount spent for tea, coffee, sugar and cocoa; and six times the amount spent on linen and cotton goods. Poor England, indeed—but, stop! What is that adage about dwellers in glass houses?

MR. WM. ROBINSON, the founder of the Garden and other papers, and author of half a dozen valuable horticultural works, has purchased 250 acres of land in East Crainstead, England, which will give him an ample opportunity, greatly needed we should suppose, of out-door work. It is time that Mr. Robinson relieved himself in this way. Upon his land is a beautiful and true Elizabethan house built in 1596. Mr. R. writes us, under date of March 15, that they have had a terrible Winter for work. "Not a kitchen garden seed sown, or a potato planted as yet. To-day the boys were skating on my lakes. Quite new for S. England in March."

THE House Committee on Post Offices has not only put its collective foot down very heavily on the bill increasing the postage on fourth-class matter; but, after thorough investigation, has reported a bill extending the "special delivery system," to all other classes of mail matter besides the first, to which it is now limited. Affixing an extra ten-cent stamp on a parcel of any kind will insure its immediate transmission and delivery, instead of being tardily forwarded and delivered as is the case by far too often at present. The speedy delivery of cuttings and other goods for field, garden and orchard, is often a matter of considerable importance. The bill should be passed, and will be if every one interested in postal reform would help it along by writing in favor of it to his Representative in Congress. If it becomes a law, the business of the corpulent express companies who sought to increase their gains, will suffer considerably. They went out for wool and are likely to come back shorn.

Pomological.

GRANDFATHER SMITH'S FAVORITE APPLE.

SPECIMENS of the apple shown at Fig. 164, with cross-section at Fig. 165, were sent to us last Fall by the Rev. Amos S. Baldwin, of Newton Hamilton, Mifflin Co., Pa. The original tree stands on a farm owned by him near Fort Littleton, Fulton County, Pa., which was formerly the property of his grandfather, the Rev. Amos Smith, after whom the apple is named. The tree is now about 75 years old, having been of good size and bearing fruit when a lady now that age was a little girl. According to her recollection, it was a seedling raised by her father, Mr. Ramsey. It is a large, flat-topped, wide-spreading tree, with an upright trunk, and is an annual and often a very productive bearer. The fruit is of good size, conical, flat and pointed at eye; stem very short, not over half an inch; very slender; planted in a deep, regular, but narrow, cavity; calyx large, open, and in a broad, shallow basin. Color a beautiful shade of red over a greenish-yellow ground, and running to a deep red in all places exposed to the sun, and the surface thickly splashed with deep maroon-red streaks, the whole surface studded with yellow dots. Core small and filled with very small, flat seeds. Flesh white, with a tinge of pink where grown fully exposed to the sun, tender, juicy, fine-grained, high-flavored, pleasant and aromatic. Quality best—as good as or better than the Vandervere. Eaten November 9, 1885. This apple is undoubtedly a seedling of the Vandervere and seems to have all its good qualities, without its tendency to scab. A superior dessert or table apple. Season from first of December to early January.

THE SHIAWASSEE BEAUTY.

PROF. A. J. COOK.

THE other night at tea, as we were all commenting on the delicious apple sauce, Mrs. Cook remarked that every family in the land ought to have one Shiawassee Beauty apple-tree. The sauce is of a beautiful pink color, and has a peculiar and delicate flavor that renders it a universal favorite. We are often asked what it is that gives the sauce the delicious flavor, and our reply that it is Nature's own flavoring stored up in the fruit, is often met with a very incredulous look.

This excellent apple is doubtless a seedling from the Fameuse or Snow, which it much resembles. The form and color, both of the skin and pulp, are quite like the same in the Snow. It is larger, however, than the Snow, and keeps much longer. We have kept it well into January—is much fairer, as the tendency to scab and deformity, so peculiar to the Snow, is entirely absent in this. But the greatest difference is in its spicy flavor. While the Snow is pleasingly tart, it is remarkably tasteless. The Shiawassee Beauty, on the other hand, is one of the most marked or radical in this respect, and its flavor is as delicious as peculiar. I have yet to find the person who does not esteem it highly. The tree is vigorous and spreading. Of several trees set out in my garden here in 1876, among which is a Duchess of Oldenburg and a Red Astrachan, none has made so large and fine a growth as this. It is not only vigorous, but it is very hardy. On my farm in Shiawassee County, Mich., I have trees of this variety that have remained vigorous and hearty all through the several hard Winters of the last 15 years. It is a very persistent bearer, equal to the Duchess of Oldenburg. My tree, set out in 1876, has borne every year for five years, and this year was a marvel of beauty, as it hung full of most beautiful apples, just such as I exhibited from it at Grand Rapids. I repeat the "*gude wife's*" words: "Every family ought to have one."

Ag'l Coll., Lansing, Mich.

Farm Economy.

A STRAW-BURNING FURNACE.

A GRIEVOUS source of expense, inconvenience and suffering to many in the blizzard-swept prairies of the West, where timber is scarce, coal mines remote, country roads bad, and railroad transportation scanty and expensive, is due to the scarcity of fuel. In hundreds of other places throughout the country, also, a convenient supply of fuel would add not only to the comfort of many a farmer and farmer's family, but also to the good man's bank account. Yet in these sections ample stores of excellent materials for fires are wasted in ignorance of the method by which they can be used in this way. The use of hay and straw for this purpose in suitable furnaces, was first introduced by the Russian Mennonites in Manitoba, Dakota, Minnesota, Nebraska, Kansas and other places in the West where these thrifty colonists settled in considerable numbers over a dozen years ago, having imported this, among other practices, from their old homes in Southern Russia. The plan was so evidently convenient and economical that it was widely adopted by their neighbors, who, with greater enterprise and inventive ingenuity, have improved upon the old devices, especially in the way of cheapness of construction and economy in the use of fuel. When the advantages of the method become better known, there is no doubt that it will be extensively employed in other parts of the country also.

In the RURAL for May, 18, 1878, we gave a couple of illustrations and a full explanatory description of a Mennonite furnace, and at Fig. 155, we present the ground-plan at 1, and a sectional view at 2, of an improved furnace, devised by our friend, Thomas H. Youngman, Hanson County, Dakota. Of it he says: "It is the greatest thing for comfort that I or my neighbors have ever seen. Wife says she would not take $500 for it, if she could not obtain another. Ten of my neighbors built similar furnaces as soon as they saw mine, and

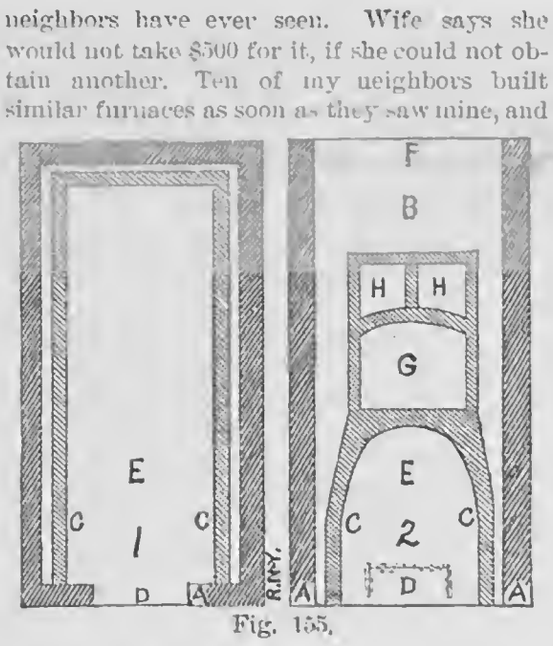


Fig. 155.

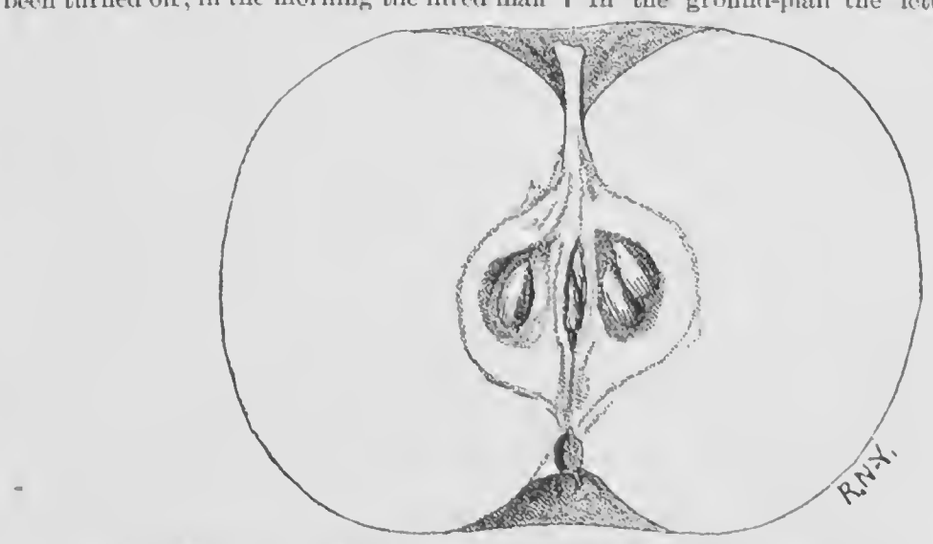
they all say, 'Well, this solves the problem of fuel in Dakota.' Daughter puts the breakfast on the 'cooker' at night after the heat has been turned off; in the morning the hired man fires up the furnace, turns the heat into the 'cooker' and by the time daughter comes from her room, the kettle is boiling, the potatoes are baked, and the breakfast is ready to be served. Six rooms in my house have been kept beautifully warm night and day even when the thermometer registered 30 degrees below zero. A hard-coal stove running at full blast in each room, would not have made us as comfortable, at a cost of $25 to $40 per stove; while if I had to buy all the straw I used for this furnace the outlay would not have been over $8 to $10. I burn wheat or flax straw or prairie hay, all of which are cheap in this section. Often we do not have to tend to the furnace oftener than three times a day. In spite of the arctic blizzards of Winter, my wife says she has been more comfortable in the house the past season than she ever was in winter time in Central New York with kitchen and parlor stoves. With this, too, there is no annoyance from dust or ashes in the room.

In explanation of the diagram, Fig. 155, sectional view, A A are stone walls a foot thick inclosing the furnace. Brick may also be used, or a mixture of one part of sand with two of clay—a style common among the Mennonites. B is an air-chamber extending to the ground on each side of the furnace. Cold air is admitted into this through a hole in the bottom of the outside wall. Some introduce the cold air through a pipe, but this is not necessary; if obtained from the cellar, the latter will be kept well ventilated. D is a cast-iron door 20x14 inches. E is the fire-box, six feet ten inches by six feet by three feet to the center of the arch. F, line of ceiling. G, oven on top of arch, with return flues H H. This is necessary in moderate weather, as the rooms become too warm when the fire is strong enough to bake in the heater in the dining-room. This heater or "cooker," is a double-walled, sheet-iron baker, the inner sides being two inches from the outer, the inner bottom six inches from the outer, and the inner top four inches from the outer. A pipe runs from the chimney at each end of the furnace to the west end and discharges into a drum in the sitting-room. A "register" opens into the sitting-room and a bed-room opens from the air-chamber. Upstairs in the "study" is placed a drum, through which passes the fire that has passed through the "cooker" in the dining-room. In the bed-room up-stairs is placed another drum, through which the smoke and fire from the drum in the sitting-room pass. The cost of the devices will be different in different localities. Here heaters cost $10 to $20, and drums $2 to $5, according to size. The furnace door costs $5 to $7. For building from four to five cords of stone and from 500 to 700 bricks will be wanted. Dakota clay mixed with from seven to ten parts of sand is very nearly as good as fire clay. Walls of less thickness than nine inches will do, but the thicker the walls the better the heat is corraled. The oven and return flues will aid materially in this work. In the ground-plan the letters indicate the same parts as the corresponding letters in the sectional view."



GRANDFATHER SMITH'S FAVORITE APPLE. From Nature. Fig. 164.

GRANDFATHER SMITH'S FAVORITE APPLE. Half Section. Fig. 165.

PLOW SHOE.

FRIEND C. C. Upton sends us all the way from Weld County, Colorado, the sketch of a plow shoe, shown at Fig. 154, which he finds very convenient when, in moving a plow from one field to another, he wishes to hitch directly to the plow. To make it, take a piece of hard wood 16x8x2 inches; bevel one end so as to make a good runner; then bore three-quarter-inch holes so that the distance between them shall be wide enough for the plow-point, their tops being closer, so that the point cannot rise between them. Another pin, near the land-side, will prevent the turning of the shoe.

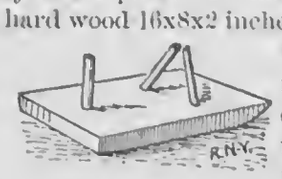


Fig. 154.

A VINE CUTTER.

FRIEND, G. E. TYLER, Cuyahoga Co., Ohio, is a grower of small fruits, and having only one arm, he couldn't use trimming shears in cutting out old canes of blackberries and raspberries, so he devised the tool illustrated at Fig. 156. The cut fully explains the nature of the implement, which any blacksmith can form out of an old file or other handy piece of old iron. Strips of leather may be tacked on the handle to keep the hand from slipping. In using it a person can stand upright and do the work with the greatest ease.

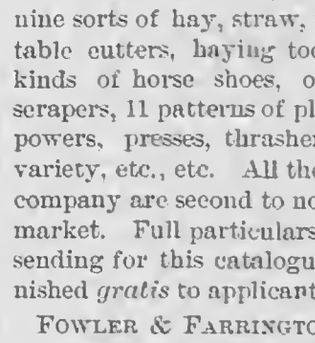

Fig. 156.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

BELCHER & TAYLOR AGRICULTURAL TOOL COMPANY, Chicopee Falls, Massachusetts.—Catalogue of the numerous agricultural implements made by this old, extensive and thoroughly trustworthy company, including bag-holders, barrows, iron castings, three kinds of corn shellers; eight sorts or modifications of cultivators, fan mills, nine kinds of harrows, nine sorts of hay, straw, stalk, root and vegetable cutters, haying tools in variety, four kinds of horse shoes, ox shovels or road-scrapers, 11 patterns of plows, potato planters, powers, presses, thrashers, tobacco tools in variety, etc., etc. All the goods made by this company are second to none of the kind in the market. Full particulars can be obtained by sending for this catalogue, which will be furnished *gratis* to applicants.

FOWLER & FARRINGTON, successors to Geo. H. Fowler, Taughannock Falls, N. Y.—Circular of the hay and grain elevator and carrier and improved plow sulky, manufactured and sold by this trustworthy firm. The pitching apparatus of carriers' fork, slings, pulleys, etc., is designed not only for pitching hay, but also for pitching and conveying bound grain, corn-stalks, etc. The fork or grapple, made of steel and malleable iron, will pitch anything a farmer has to mow or stack. The pulley has a wrought-iron frame, with a hard-maple frame two inches thick and five in diameter. All the important parts of the plow sulky are of wrought-iron or steel, rendering breakage difficult, and the implement is simple, neat and handy. Send for the circular for fuller particulars.

IMPROVED ROAD MACHINERY.—Pamphlet from the American Road Machine Co., Kennet Square, Pa.—The intelligence and public spirit of a community are measured by the condition of its roads. Good roads will increase the value of all adjoining farm property, and add greatly to the sociability and public spirit of any neighborhood. The improved road machinery described in this pamphlet will more than pay for itself in any township. The instructions given are complete and practical. The Spring is the best time for working roads, and these implements can hardly be improved upon. We advise all those who are seeking to improve the roads in their districts or townships to send for the pamphlet. It will pay them to study it.

A. H. REID, 26 S. 16th St., and 1631, '33 and '35 Barker St., Philadelphia, Pa.—Circulars of the excellent butter mold, tin tray butter shipping box, patent power butter worker and two-can creamery made and for sale by this thoroughly reliable house. The mold is very convenient and easily worked, and of the shipping box we can speak highly from personal experience. The many advantages of a butter worker and creamer have been frequently pointed out in these columns, and those offered by Mr. Reid are of superior design, materials and workmanship. The circulars will be promptly sent free on application as above.

MASSACHUSETTS STATE EXPERIMENT STATION.—The third annual report is more complete than either of the former ones. A great deal of work has been accomplished at the station. Many valuable analyses of fruits, feeding stuffs, fertilizers, etc., etc., are recorded, and the feeding experiments and experiments with potatoes and root crops are carefully reported. Farmers will find much to interest them in this report. It is time that they understood that these stations can be made to help them if they will only take interest enough in the work to see what is being done.

THE GREAT AMERICAN TEA COMPANY.—Circular describing the business methods pursued

by this house, as well as a list of the premiums given to those who purchase given quantities of tea. The teas offered are of excellent quality and are remarkably cheap. Those who desire to order their teas in bulk will do well to examine this circular. The firm is doing an enormous business, and will do what they promise. The circular may be obtained at 33 Vesey street, New York.

KEYSTONE POULTRY YARDS.—Circular from E. J. Chandler, Kennet Square, Pa. Descriptions of Plymouth Rocks, Light Brahmas, Wyandottes, White-crested Black Polish, Buff Cochins, White Cochins, Mottled Javas, Langshans, Bantams, White Guineas, American Dominiques, Toulouse Geese, Pekin Ducks and Mammoth Bronze Turkeys. Those who have not yet secured eggs for hatching should send for this circular.

STANDARD ROOFING.—Circular from A. F. Swan, 46 Cortlandt Street, New York. This roofing is excellent for use upon stables and poultry houses. Both the roofing and the tarred felt are impervious to water and air and are vermin-proof. The standard 3-ply roofing is said to make a thoroughly fireproof roof. Let all those who are interested in building, send for the circular.

For Women.

CONDUCTED BY MISS RAY CLARK.

MY BABY.

ONE year ago to-day I held thee first
Within my loving arms. Where art thou, sweet?
I see thee not; thy cradle empty stands;
And thou art gone; thy earthly home knows thee
No more. I cannot cause this human heart
To cease to long for thee. Was mother-love
Created changeless, deathless, but to have
Its tendrils rudely snapped, no more to be united?

This is thy birthday, and I
Thy mother, cannot take thee in my arms;
Upon thy lips no birthday kiss can press;
For thou, a little while ago, didst have
Another birthday; through thine own sufferings
Thou wast born into the realms immortal.
Why do I weep? What cause have I to mourn?
Thy little life has left no stain upon
Thy pure, sweet soul; a snow-white bud, thou canst
Unfold in Heaven's light, in loveliness
More lovely still for this thine early call.

Hadst thou staid here, my child, thou wouldst have been
Another tie to bind me to the earth!
But now thy little hands reach out to me
From that fair land, and still, a little child,
An angel child, shall lead me on.

Hast thou no need of me? Canst thou at once
Become content to live apart from thine
Own mother? At every turn I miss thy smile,
Thy merry shout, thy nestling head. Then in
My grief I pray that thou knowst not the pangs
Of parting; that to thee my place be filled.

One moment thou wast here, my baby, mine,
The next thou wast an angel babe, and yet
My baby still. And who shall say but what
To thee my loving, tender thoughts shall reach
And make thee glad, as did my fond caresses.
There is a pleasure in the thought, though none
May say that it is truth. The grief I know
Can never come to thee. My sorrow o'er
Thy grave hast spared thy sorrow over mine.
My thoughts are full of thee and thy new life.

—S. E. H.

WHAT TO READ AND HOW TO READ IT.

IV.

CONCLUSION.

"IT goes without saying," as we nowadays love to say, that in these very desultory and familiar talks, I have not attempted to lay down any definite course of reading, or, indeed, to do more than touch upon the confines of the great world of books well worth our study. Writing for busy and practical people, I have endeavored only to give them a few hints as to the employment of their rare hours of leisure, and to set their feet in better paths than those that lie among the literary weeds. If, however, any ambitious young girls can make the time for a course of study in history, I would recommend to them Freeman's historical series consisting of small and well written text books on England, France, Germany and other prominent nations. If any of my young readers are fortunate enough to have already a good grounding in the history of their own country and of England and France, they cannot do better than to study, with careful reference to maps and chart, an admirable series entitled "Epochs of History," each volume prepared by some historical specialist. A perfect chart of history is one published by A. S. Barnes of New York, and arranged by Miss Ida Whitcomb. A large page is devoted to each century or half century, and one sees at a glance all the contemporaneous monarchs and principal heroes. Blank spaces are left, wherein the student writes her own synopsis of each reign. I know of a class formed for the study of history, which proceeds in this way: the young women meet every fortnight; each one carefully prepares the history of 10 years of a certain country, one taking England, another France, etc. At a meeting of the class, she recites accurately her own lesson, and listens with all her energy to the recitations of the others. When 50 years have thus been studied, essays are written on the leading topics of the period, and are read at the class meeting. If, for instance, the period covered be 1450—1500, the topics might be commerce, literature, "Savonarola," "The French in Italy," "The Dawn of the Reformation," art, architecture, printing, etc.

I once belonged to an interesting class in English literature, in which we divided the literature into periods, following the division of "Collier's Literature." Then, omitting all the minor names, we selected the greatest men of each period, learned all we could of their history, and recited selections from their works, arranging our selections at each meeting for the next, so as to avoid repetition of favorite passages.

Still another class took the cities of Europe, proceeding as follows: London was first taken; one member of the class was appointed to write a brief history of London, telling about its foundation, its fires, its plague, its growth, its great events, etc. Another wrote an article on the churches of London, St. Paul's and Westminster Abby, being most fully treated. Another took the palaces; another the "Tower;" another the remaining public buildings; another the "Art of London;" another the "Literati of London;" another "In London with Dickens;" another "In London with Johnson," etc., almost *ad infinitum*. London alone occupied the class for a whole Winter.

This last plan of study involves more books of reference than the others; hence the difficulty of pursuing it in the country.

If, however, some of you girls will put by the endless fancy work, so tedious, expensive, and ugly, and will study together, history or literature, instead of crazy-quilts and splashers, you will accomplish a winter's work more beautiful and more durable than could ever be the result of all that busy idleness, which employs your fingers only. Give your undergarments a few neat tucks, instead of the hideous ornamentation of heavy, homemade trimming, and employ the active minds God has given you in learning something of His work in this wonderful world of ours. If you have any leisure in the Summer, there is an opportunity, with the aid of a simple textbook, of learning something of botany, geology, or natural history. If your home is too isolated to enter into any such plan of study as I have described, you will find delight and improvement in such books as Macaulay's and Jeffery's "Essays," Plutarch's "Lives," etc. Disraeli's "Curiosities of Literature" is a wonderful *omnium gatherum* of interesting things, and is the best book I know of for a "pick up." In my own country neighborhood it has been *the* book of the Winter; we have all been quarreling over the possession of the four volumes. If dinner table talk is very drawling and trivial, it would be a good plan for some such sister as "Charity Sweetheart," to have the book beside her plate, and to say, perhaps, "Just listen, father, to the wonderful things old people have accomplished!" After she has read Disraeli's page of the "Achievements of Old Age," the conversation will drift into another channel than the hired man and the potatoes! Another book, full of wisdom, a book to be read over and over again, is "Whately's Annotations of Bacon's Essays." It is not a volume of easy chat like the "Curiosities of Literature," but demands much careful thought. I don't see, however, why our intelligent farmers and their wives and grown children should not appreciate just such a book. The chapters on "Superstition," on "Riches," on "Studies," on "Youth and Age," are but a few among the many, that offer the richest food for thought.

"But," some of you will say, "where are we to get all these books?" Will you be astounded, if I reply: *Buy* them? To buy a book seems to me the last possibility that occurs to people in general; and yet, in no other way will a little money do so much. Two dollars for some luxury of dress or table is readily given, and two dollars will purchase for you a counsellor and friend for your life-long—a poet to lift you into a higher world, a philosopher to guide you through this one by nobler paths than you yourself could find. Of course, book-purchasing must be done little by little. No one knows better than I the limitations of a slender purse. But, if you can afford but a single book a year, that is a possession for your life. The "Life of Robertson," of which I wrote in a former paper, costs $2.00, and you will read his letters and lectures and addresses with increasing relish, as long as your mind grows and your character develops. Whately's "Annotations" costs, I believe, about $2.00—and it gives you the most famous words of the great Inductive Philosopher, illustrated by the condensed wisdom of one of the most celebrated modern thinkers and theologians. "The Epochs of History" are about 90 cents apiece; and you will have noticed how cheaply may be procured single volumes or whole sets of the standard poets and novelists. *Don't* buy paper backs! One durable book is worth a dozen of the perishable. And don't buy any ephemeral literature. Build up, no matter how slowly, a little library for yourselves, composed of the *best* authors in each department. Read these volumes over and over; read them so as to absorb all their great thoughts and high teachings, so as to appreciate all their delicate handling of our noble language, so as to make them almost integral parts of your own minds. Try sometimes to write from memory an abstract of your history or biography; learn accurately such passages of prose and poetry as most impress you. "Despise not the day of small things." Be content, if need be, to give only half an hour a day to your books—but give that *thoroughly*, and your life will be a perpetual growth. You cannot become petty household tyrants, or despicable gossips in such society. Every year will see you larger-minded, larger-hearted, better poised women—whose souls are full of sweet charities, from whose lips come words of gracious wisdom—women of each one of whom may be said: "Strength and honor are her clothing, and she shall rejoice in time to come." A COUNTRY HOUSEKEEPER.

DESIGN FOR MARKING TOWELS FOR GLASS.

ONLY A MOTHER-IN-LAW.

POETS and story-writers never tire of picturing a mother's devotion and self-sacrifice for her children's good. But the instant one of these children marry, what a change takes place. At once she is transformed into that terrible being, a "mother-in-law." She is the same woman still, with the same deathless love for her children, but she has "out-lived her usefulness" by the common verdict, and it is time she should "step down and out." The public press is responsible for much of this change of sentiment with regard to once honored parents. Its ceaseless slurs on the class referred to must have its evil effect upon the young. They quickly catch the tone and repeat the stale jests regardless of the hearts which they wound like poisoned arrows.

It is a very sad thing to see the son of a widowed mother marry a young girl, and bring her home to rule in his mothers' house. Instead of taking a daughter's place, she assumes that all a mother-in-law's possessions are hers by right and that she can use, or carelessly destroy them as she pleases, angry at any remonstrance, and ever ready to complain that a mother-in-law is so much in the way. Girls! do not accept such a position unless you are ready to take a daughter's place in the home. Weigh well the whole matter before hand. Half the troubles of life come from want of thought. Remember that what you bring to your new home is your own, subject entirely to your control, what belongs to your mother-in-law is exclusively hers, unless given to her son you may be allowed to use it as a favor, but always subject to her control. If you do not like such a view of the case, do not take upon you such a relation. But having assumed it remember to deal justly as one who must give an account to the Judge of the widow.

It is wisdom for those in health and strength to lay by in store for days of feebleness and old age, and then to hold the estate in their own hands while life lasts. A happy little grandmother of mine lived on to 77 years in her little home, renting out her farm, except the orchard and garden, and welcoming to her home her children and grandchildren, some of whom always lived with her, but setting her own little table to the last, even when a daughter's family occupied part of the house. Though often dining with them, she preferred to feel that she was a house-keeper still. She was one of the happiest old people I ever knew, and "the best company" for old folks or young.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

HOUSEKEEPING IN CALIFORNIA. IV.

MARY WAGER-FISHER.

ONE morning early in December, a lady took me in her carriage to visit Piedmont, a few miles out of Oakland—a beautiful section of high rolling country planted with groves of eucalyptus, and commanding very extensive and charming views. She had the carriage stopped at a handsome residence set in beautiful grounds, and she said the occupants of the villa were friends of hers, and had given her permission to bring me in to enjoy the views from the windows. Quite a party of people were out in the sunshine, guests at the house, who were to remain to luncheon. The owner of the place, Mr. R., a retired miner, gave us a cordial greeting and, excusing himself from his guests, took us into the house and later in a tour about the grounds. Upon entering, we met Mrs. R. in a lovely bright French frock—just the thing for morning and very elegant withal—but the house required fine apparel. She, too, was very gracious, and led us from room to room, all thrown open into each other, the sunniest, brightest, most charming rooms to be imagined, with great windows and large grates of coal fire which combined to give a sense of sunshine in every corner. So many grand houses are dark and shaded, but this was just the reverse, and still without glare. As we did not wish to trespass upon their luncheon hour, we cut our visit short, and I came away with a confused sense of having been in the most charming interior in the country! I remember some details—mantels—the whole finish of the fire-place—of California onyx, far more beautiful even than Mexican onyx. Mr. R. said it was found near Sacramento, but in a very limited quantity, which had already been exhausted. There were flowers everywhere throughout the house. Ceilings were beautifully frescoed; even the hard-wood finish of a small conservatory was decorated with painted vines. On the walls were fine paintings, chiefly of figure. "My landscapes," smiled the handsome, genial host, "lie out of the windows; no one can paint pictures equal to those." From every great window lay outspread a beautiful scene, and all different—scenes made up of mountains both near and far, a lake, the San Francisco Bay and Golden Gate, the Santa Clara Valley, the city of Oakland, the piers out in the water, the boats and ships, and all the nearer beauty. The furnishing of the house was perfect—such as wealth allied to taste can command. I noticed that the woodwork in one room was painted a pale silver gray, illuminated with bands of gilt, and it was very pretty. The lunch table was already laid—exquisite napery almost reaching to the floor, and exquisite china. Raw oysters, to begin with, laid on plates that might have compensated the bivalve for his slaughter, only that his own house is lined with pearl, which is still finer. From every side one could go out-of-doors down a broad flight of stairs, and the house, which was set on a wall several feet above the ground, was banked all around with a hedge of flowers in full bloom—orange, shrubs, mignonettes, datura, fuchsias, pelargoniums, roses, abutilons, carnations, lobelia—a multitude of plants. We

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria,

walked out to the play house of the six-year-old daughter of the house—a charming little house with engravings on the wall, a little cook stove and all her playthings, where she could have her playfellows and cook their own dinners. The acacia trees were showing their coming bloom; but beautiful as this tree is, it seems to require great care to keep it from splitting down. I said to Mr. R. that the place was so delightful that I shouldn't think he would ever wish to go anywhere! He said that was true; he really found no spot to his eyes so lovely as the "Highlands," the name of the place. He quoted his little daughter, a quaint, mature child of old-fashioned ways, who upon a recent visit to Newport, which they found very beautiful, said: "Well, papa, I think the 'Highlands' will carry off the cake, after all." The place is seven years old. The many rich men in California use their wealth lavishly in making their houses marvels of loveliness, and their hospitality is of that large and gracious pattern that we imagine belongs to the country houses of the European nobility; while many of the former have vastly more money than have the latter. Although they are often people lacking culture, I doubt, from what I have heard of them, if they lack in intelligence, which, allied with a good, common education acquired early in life, fits them for almost any position they may find themselves obliged to fill. The rich Mrs. Mackey was the daughter of a barber, the wife of a dissipated druggist, and she had to earn her own living for a time and took in washing—which was then profitable. Another *grande dame* kept a boarding house, and another was an illiterate Irish woman. But, luckily, they all have good, native sense, and when in their own homes are in no danger of ever being mistaken for a chambermaid. Money can supply a first-class butler and a first-class housekeeper and artistic surrounding, but it is very difficult for money to put good English into the mouth, unless it has been acquired in youth, and nothing more quickly betrays good or ill breeding, than one's speech, and the care of the teeth! And the wise American youth—if wisdom could only come a few years earlier when one has not wise parents to pour it out of their experiences—will not mind mean dress, plain food, ugly, unfurnished lodgings, or obscurity, but they will study good conversation, master a good style of writing, so as always to be able to write a fine letter in every particular, keep erect, preserve a spotless reputation, and take the best care of the body. Then if wealth comes in later life, they will be ready to use it fittingly and not be made a fool by its possession. A very cultivated young woman here said to me one day when we were talking of the reckless expenditure of some rich Californians—one had built a $5,000 play house for his children, he afterwards failed—"The very *best* people in California are not rich, some even havn't enough for comfort. And rich Californians are chiefly hospitable to other rich people. It isn't their way to give dinners and receptions to genius and merit." Her strictures I thought a little harsh, although it is true, undoubtedly, that social lines are more closely drawn in California than in any other Western State. I have just room enough left to mention that at a reception we attended, nasturtium vines in flower were much used for decoration in the house. In the center of the large refreshment table, was laid a parallelogram of dark red velvet or plush, around the edge of which was laid a border of flowers, with an arrangement of the same for a center-piece. It was somewhat novel, but I did not think it very effective. One of the ice creams was pistachio—a bright green. The napkins were all Japanese, (paper) white, with small designs in colors, and very pretty.

A FARMER'S DAUGHTER'S DOMESTIC REVERIES.

CHARITY SWEETHEART.

"Go not far from me, O my Strength!
Whom all my times obey;
Take from me anything Thou will,
But go not Thou away,
And let the storm that does Thy work,
Deal with me as it may."

I repeated these words to myself the other day when I felt tired and beaten, after a little battle with Burt, who had been talking of girls as if they were all to be measured from his standpoint. I told him he was judging only from the newspapers and books that wrote against the sex as a hobby, and that he would find as serious, thoughtful and earnest workers, in whatever they took up, among girls, as among young men. But in my secret heart, I know that we lack the philosophy of the boy, the ability to whistle instead of scream, and the equanimity that can work out a problem without haste, or ill-done work; as a rule, girls are more patient, more enduring than men, and I told Burt that I suffered more every day from some ache or pain than he did in a year, and that a finger ache was enough to lead him to "make a fuss, want a nurse" and think himself a martyr. Then he said girls were always ailing; that if they took exercise they would be better—as if I did not get exercise enough. Why, I am on my feet from morning until night. People talk about saving their strength, but with a family of men and boys with only one pair of hands, it is impossible. But lately the boys have become more mindful of me, and careful not to dirty the house as fast as I clean it, which they once did. Burt is a thinking boy—when he was ever so little he used to stop suddenly in whatever he was doing, and say, "It's queer, isn't it?" and it was generally something that his puzzled brain could not understand.

Father has had a gentleman visiting him lately, the son of an old friend. He is a farmer, but of quiet, gentle manners, and quite unassuming. But he has been a student, and has not given his mind to stories of love and adventure in his youth, so has a natural desire for good reading. After hearing him talk awhile, so differently from the young men in our village, Burt came to me and said,—"Queer, isn't it?—he's a farmer, and a practical one, not a gentleman farmer, but a gentleman *and* a farmer." I was glad that he saw the difference,—the fact that a farmer need not be a clown. And if this could be better understood by our young men—that their manners need not be boorish because they are farmers—they would be less likely to sneer at girls who prefer refined manners to vulgarity. Country boys often pride themselves on their uncouthness as differing from foppishness; but it is a good thing when the happy medium can be reached.

Spring has come and the work must be once more begun of cleaning up, and preparing for Summer. My garden plots trouble me most. They are small and I cannot get them to look pretty all the year or rather all the flowering season. As soon as I get one lot blooming, the early flowers begin to look ragged and brown. Those who write on this subject generally do so for the people who have large gardens—and plenty of plants. When I cut up my geraniums, and set them round the bed, they all wither off and are just getting nice when Fall comes. I should like to have nice *pickable* flowers, but cannot afford to spend any more than will purchase a few seeds at the grocery stores with some of the egg money.

A WEEK'S WORK AT MRS. HOMESPUNS.

THURSDAY.

This was usually considered a resting day; visits were more apt to be planned for this time of the week, or any extra work that needed to be done was usually brought forward then. In the morning, after her daily round of household duties, such as comes to every working mistress 365 days in the year, was over, Mrs. H. announced that she intended to go to the church social in the afternoon, but she wished to make the forenoon count too, in some effective way, and she accordingly had her quilting frames brought in, and put on a quilt, or, speaking in modern style, a comforter. The material was of red cheese cloth, the top and bottom alike, and it was tied, or rather tufted, with white tying yarn. The tufts were strands of the yarn an inch or so long, five or six in a tuft. They were tied through the middle with white thread used double, and if they were uneven they were afterwards trimmed off a little.

It was tied sufficiently close to hold the thin layer of wadding securely in place. It was to be finished by working the edges (instead of binding or hemming) in button-hole stitch, the same material being used as for the tufts. The nimble fingers got it off the frame before dinner time, and the work was viewed with much satisfaction, being very ornamental for the amount of time spent on it.

In the afternoon Mrs. H. attended the social, where she took an active part in the proceeding, and found the change of scene very beneficial to her spirits.

DOMESTIC RECIPES.

NICE WAYS OF COOKING VEAL.

Take a fillet of veal, have it boned, then stuff it with a dressing made of bread crumbs moistened with boiling water. Add a generous supply of butter, season with salt, pepper, the grated rind of a lemon, and the juice of the same. Put your meat in the dripping-pan, sprinkle with salt and pepper, squeeze over it a little lemon juice, roast well, allowing fully 20 minutes to a pound. Make a rich gravy, and serve with sliced lemon.

VEAL STEW.

Take cold roast veal, cut into mouthfuls, add any gravy you may have left, season well, adding a dash of curry powder and some mace and a very little boiling water, stew for half an hour, then add a good half pint of milk, stew a while longer and serve. Jellied veal may be made the same as jellied chicken, and is most delicious. AUNT EM.

Debility

Languor, and Loss of Appetite, are cured by the use of Ayer's Sarsaparilla. It removes that terrible sense of *Constant Weariness*, from which so many suffer, gives tone and vigor to the stomach, and restores health and strength more surely and speedily than any other medicine.

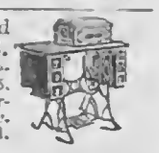
Three years ago I suffered from Debility and Loss of Appetite, the result of Liver Disease. After having tried various remedies, and consulted several physicians, without benefit, I was induced to take Ayer's Sarsaparilla. The first bottle produced a marked change, and the second and third accomplished so much that I felt like a new man. I have, since that time, taken about one bottle every year, and had no recurrence of the trouble.—William E. Way, East Lempster, N. H.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

ORGANS The most beautiful and finest toned in the world. Low prices, easy payment. Send for Catalogue. Address Weaver Organ & Piano Co., YORK, PA.

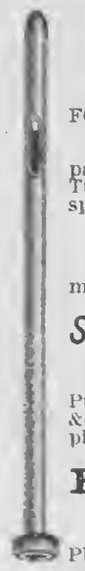
12 DOLLARS each for *New* and *Perfect* SEWING MACHINES. Warranted five years. Sent on trial if desired. Buy direct and save $15 to $35. Organs given as premiums. Write for FREE circular with 1000 testimonials from every state. GEO. PAYNE & CO., 47 5th Ave. Chicago, Ill.



THE "COMMON SENSE" MILK PAIL.

This is the only *perfect* Pail made. There are no seams in the front to catch the dirt. It has a perfectly fitting strainer, which can be instantly removed, so that every part of the pail may be *quickly* and *thoroughly* cleaned. Should the strainer become foul or worn with use, we can furnish new ones at very little expense. The Pail is well made of heavy XX tin, and we offer it to the farmer at the very lowest price at which a really good article can be sold. *Send for special circulars.* Price $1.25 each. Discount to the Trade.

MILKING TUBES,



FOR MILKING COWS WITH SORE TEATS

ALLEGER ORGANS you can get a strictly first class organ from $50 to $75, stool and book. Warranted 5 years. It will pay to send for circular before you buy. Address the manufacturer. H. W. ALLEGER, Washington, New Jersey.

SALT. ONONDAGA F. F. SALT. SOLE MANUFACTURERS, American Dairy Salt Co, (Limited.)

Chemically purified and WARRANTED pure as any in the market. Used by a great majority of the Dairymen of the country. Unexcelled for Butter, Cheese, the Table, and all Culinary purposes. Took Medal at Centennial "for purity and high degree of excellence." Dairy goods salted with it took first premiums at New Orleans World's Fair, N. Y. International Fair; Milwaukee Exposition, and always wins when there is fair competition. It is American, and *cheaper and better* than any foreign salt. Try it. Address

J. W BARKER, *Secretary*, Syracuse, N. Y.

PURE NATURAL LUBRICATING OIL

Guaranteed not to gum or chill in the coldest weather; the best oil in the market for all kinds of farming machinery, put up in ten gallon cans, and shipped to any address on receipt of five dollars. Try it. Address

FRANKLIN OIL WORKS, FRANKLIN, PA.

INVENTORS and MAN'F'RS. Send for large pamphlet containing U.S. **PATENT** Office Rules for obtaining Patents. B. B. BROCK, Atty., Washington, D.C.

News of the Week.

HOME NEWS.

SATURDAY, April 10, 1886.

Logan's bill increasing the army from 25,000 to 30,000 was defeated in the Senate, Wednesday—yeas 19, nays 31. Some see in the result the "fine hand" of Blaine jealous of the growing importance of Logan. All can see in it the effect of the bitter opposition of labor organizations and of all others who do not like to see the U. S. Army used as a police force in troubles between employés and employers. Logan earnestly protested that there was no connection between the advocates of the measure and Jay Gould; but just now a suspicion of such a connection would be enough to kill a ten-times-better bill....The following are the rates just established on the Northwestern railroad lines from Chicago to St. Paul and Minneapolis:—First class, 30 cents; second 20; third, 15; fourth, 12½; fifth, 10; class A. 12½; class B, C and D, 10; grain and flour, 12½..... All people in any way connected with the manufacture and sale of intoxicating fluids, being excluded from the Order of the Knights of Labor, a movement has been started in New England to form an Order of these "outcasts," for the purpose of raising money to support favorable and oppose unfavorable legislation, municipal, State and National, and to influence their patrons' votes to support grog-shop candidates. Whatever they may call themselves, the public have already dubbed them the "Knights of Liquor."..... More than 9,000 bills have now been introduced into this Forty-Ninth Congress—more than 7,200 of them in the House. There are no signs of an end to the influx till the end of the session in December. It is thought that not over 100 of all hitherto introduced will become laws. The others cause heavy expense in printing, block the files of the Committees and over-load the calendars—mere "bunkum" bills to please the introducers' constituents..... .....The statement of the revenue and expenditures of Canada for the nine months ending March shows a revenue of $25,165,252, an increase of $1,916,173 over the corresponding period last year. The expenditures amounted to $23,699,676, an increase of $1,174,623 over the same period in 1885..... ....Total subscription to the Grant Monument Fund $119,216; to the Hancock Widow Fund $42,732.....A bill has been introduced into the Canadian Parliament to create a court of railroad commissioners, who shall have the determining of railway matters and especially of differences of rates. These are now regulated chiefly by those of competing lines in this country.....The Senate has granted the Kansas and Arkansas R. R. the right of way through the Indian Territory—yeas 36; nays 8.....The Bland Bill authorizing the free coinage of silver was defeated in the House, Thursday; yeas, 126; nays, 163. A motion to suspend the coinage of silver as at present, after July 1, 1889, unless in the mean time the nations of Europe in concurrence with the United States, should make silver a standard of value again, was lost; yeas, 84; nays, 201. The anti-silver men are jubilant at the first vote; the silver men at the second. We don't want more silver coinage, but we won't have less... ....Judge Baxter, before whom the Bell Telephone suit was to be tried at Columbus, Ohio, died April 1, at Hot Springs, Ark., aged 67. Earnest, peremptory, and independent, no decision of his was ever reversed on appeal. He was thought a "patent smasher." Much anxiety as to who his successor will be, among telephone men.....Near Deerfield, Mass., the Fitchburg R. R. at a curve runs along an embankment 130 feet above the Deerfield River. Tuesday night an express train bound east spead the track, the embankment crumbled and the train—baggage car, smoker, sleeping car and two passenger cars—rolled down to the river, carrying about 35 passengers and 10 employés. Some cars went into the river, others burned on the banks—dead, 11; wounded, 22; missing, two. A wonder that any escaped with life. Nobody's fault.. ....It is reported that the Imperial Government has decided to subsidize a new line of steamers between British Columbia and Hong Kong and Australia by paying £100,000 sterling annually for 10 years.....In 1884 British Columbia passed an act to prevent Chinese immigration. It was disallowed by the Dominion Government as involving Dominion and possibly Imperial interests, and was referred to England. News has just arrived that the Imperial authorities say the Canadian Parliament has the right to regulate or prohibit Chinese immigration into the Dominion without "home" sanction. The Australian colonies have exercised the same right. The constitutionality of the act of the British Columbia Legislature, with reference to the Dominion Government, will soon be decided by the Imperial Privy Council..... The new Chinese Minister to this country has been refused "the usual courtesies" on arrival at San Francisco, and forbidden to land till he showed his credentials. The Chinese Minister at Washington indignantly complains; State Department telegraphs for explanation to Collector of Customs at 'Frisco..... The hostile Apaches surrendered unconditionally the other day, and Gen. Crook has just started 75 of them to Fort Marion, St. Augustine, Fla. Geronimo, after surrendering, escaped from Lieut. Maus, and four days' hot pursuit failed to recapture him..... Municipal elections in Ohio, Tuesday, favored the Republicans, who carried Cincinnati, the head-center of claimed frauds and ballot-box stuffing.....Over two-thirds of the successful candidates in the municipal election at Chicago are also Republicans. New election law tried there for first time on Tuesday..... Canadians are bound to admit American vessels into their ports "for wood, water, shelter and repairs," and Congress is very likely to warn our neighbors that absolutely no other rights will be allowed Canadian vessels in our ports. New England fishmasters who oppose a renewal of the late treaty with the Dominion "in the interest of the American marine service," have to hire seamen in Canada. Although these would starve at home, Canada won't allow American vessels to ship them at good wages, and considerable expense is incurred in getting them to American ports or on board ships outside the three-mile limit. In the Maratime Provinces many live by selling bait; yet Canada says it must not be sold to Americans, though the French are welcomed to buy it. The Canadians got $5,000,000 from us for the advantages given our fishermen by Canada over those given Canadian fishermen by us, yet now the Canadian fishermen are eager to make an exchange on equal terms; but our fishermen are opposed to it. Bitterness growing on both sides.....The Labor Arbitration Bill passed the House by a large majority, many who spoke bitterly against it, finally voting for it, through dread of the workingmen's votes. While it compels the production of the books and accounts of employers before the Commissioners, those of labor organizations need not be produced—law should be even-handed..... ....The Chicago city government has adopted the eight-hour day for all city employés after May 1. A similar measure has been vetoed by Mayor O'Brien of Boston.....The annual spring freshets, floods and down-pours have been unusually heavy, disastrous and widespread during the week, east, west, north and south. Mere mention here of the affected localities within this week, would fill a couple of columns. The Gulf States have hitherto suffered most, the losses in Alabama, alone exceeding $2,000,000.....Flame-swept, Key West begs for outside aid.....The Mexican Pension Bill just passed by the House, gives $8.00 a month to all surviving soldiers of the Mexican war, and their widows, except unpardoned Confederate soldiers—Jeff Davis excepted..... .....Cabel W. West, of Kentucky, 45, a country judge and hard-fighting ex-Confederate soldier, succeeds Murray as Governor of Utah.....Cols. Ruger and Potter of the 18th and 23d infantry, succeed Miles and Howard as Brig.-Gen'ls, because of their long-time meritorious services, and because they will soon be "retired for age," making room for the disappointed....Sec. Manning was allowed to sit up Wednesday; but he will probably soon carry the biggest brain in it out of the Cabinet. ....Pres. Diaz says the Mexican troops who shot Capt. Crawford couldn't believe the Indian scouts composing most of his force were friendly, for the treaty permits only the regular troops of either Republic to cross the line..... The Strike on the "Gould System" is growing more stubborn and vindictive. Double-dealing charged against Gould in his conference with representatives of the Knights of Labor in this city; insolence and disdain charged against his representative, Vice-President Hoxie, in his interview with the men in St. Louis. He virtually refused to take on any K. of L., and is fast discharging all who remained in the employment of the roads of the "system."....A collision between deputy marshals and strikers at Fort Worth, Texas, resulted in the killing of four of the former and one of the latter. First shot attributed to both parties. Men ambuscaded a moving train; but a deputy fired first, it is said, at a striker who tried to get on the train. State troops heavily massed in the town; armed strikers congregated there in great numbers.....Fighting also at Laredo, Texas. Details not to hand yet.....Yesterday afternoon at East St. Louis (on the Illinois side of the Mississippi, opposite St. Louis), the terminus of all the Eastern trunk lines and of several to the north and south, a crowd of strikers moving towards the railroad yards was fired into with Winchesters by 15 hired roughs acting as deputy marshals, and six men and one woman were killed, all, except one striker, innocent lookers-on. Crowd grew furious; deputies fled across bridge to St. Louis for their lives; one reported captured and pounded to death; others in jail "for protection" in St. Louis. Bloody riot and immense destruction of property prevented only by impassioned appeals of the leaders of the K. of L. Three fires reported in the railroad yards at two o'clock this morning. Powderly says that now the strike must be carried on to the end. Vast numbers joining K. of L. everywhere. Over $3,000,000 ready to support strikers; much more easily collectable. Claims of railroads that all freight trains are running emphatically denied. Comparatively few running and those more than half empty. More bloodshed and destruction probable, and the end by no means in sight.....Other strikes numerous in all parts of the country.

AFTER two years' trial, we unhesitatingly pronounce the Boss ZINC and LEATHER COLLAR PAD, the only durable and successful one that we have ever used. It retains its shape, is cooling, prevents chafing, and thereby keeps the horses' necks clean and healthy. HIRAM G. DODGE & SONS, Wood & Coal Dealers, Madison, Wis.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, April 10, 1886.

CONSULAR returns now show that actual purchases of wool this season for America from Melbourne, Sydney and Adelaide, aggregate 25,419 bales.....It is stated that the entire Ohio Congressional delegation is pledged against any effort to reduce or destroy the tariff on wool.....A market for horse flesh has been created in this and several other large cities, by feeding horse meat to the wild beasts in the various zoological collections. The carnivora are said to thrive better on horse flesh than on beef..... ..... In the New Jersey Senate yesterday, the bill allowing a bounty for the encouragement of sugar production in the State, was so amended as to limit the term of the bounty to one year, instead of four..... One of the results of the cheap transcontinental freights is the shipment of flour from San Francisco to St. Louis and *vice versa*, both flours crossing each other on the road. California flour is better for pies, cakes, sweetmeats, etc., as it is much "shorter," requiring less lard, sugar, etc.....There's a bill now before the New York Legislature imposing penalties for killing small birds, except the English sparrow. The informer should get a share of the fine, to make the bill effective.....Iowa women, in convention at Des Moines, have humanely resolved that "hereafter we will abstain from buying any plumage where the life of the bird is sacrificed to obtain the ornament.".....Audubon societies are being formed in many places to protect birds from slaughter; ornithologists are busy in the same line.....The Iowa Assembly has passed a bill prohibiting alien non-residents from acquiring title to land..... .....Strawberries are arriving here from Florida in 28-quart ice-boxes, by freight, icing done every 24 hours—railroad freight about 18 cents a quart.....The Iowa Legislature has just provided severe penalties for all attempts to sell fraudulently bogus for genuine butter.....In April, 1885, Land Commissioner Sparks declared that gross frauds had been committed in making entries under the Homestead and Preëmption Acts, and took away from settlers in the West the right of "perfecting" the titles to the land taken up under these acts, until the entries could be investigated. Over 40,000 "claims" were affected in 12 States and Territories. Sec. Lamar, with the approval of the President, has overruled the Commissioner's ruling, and allowed the titles to be perfected, so that the lands can be sold or mortgaged as the property of the settlers. Sparks says a great deal of fraud has already been prevented by his action, and much good to honest settlers has resulted, while some hardships were inevitable from a rule covering so many cases. Advices from the Far West say Sparks's ruling was a salutary check to frauds, and a boon to honest settlers in general, though some of these suffered temporarily from it.....

TWICE AS MANY MERCHANTABLE POTATOES.

H. J. BAKER & BRO., N. Y.

Gentlemen—I used your Potato Manure at the rate of 600 lbs. per acre. Where it was used I harvested about the same quantity as on land fertilized by other brands, but yours produced more than TWICE as many MERCHANTABLE Potatoes. ISAAC BROOKS,

Chester Co., Penn.—*Adv.*

Crops & Markets.

SATURDAY, April 10, 1886.

The export trade in live cattle is still comparatively small; but only choice animals are exported, as freight charges on others would be as heavy per head, while the price would be lower, and consequently the proportion of expense to cost greater. The number of really choice cattle still produced here for the butcher is not large—pure-breds are generally more profitable for breeding purposes. Exports, therefore, have much influence on prices of choice stock in our home markets, and the figures for choice stock influence those for inferior animals. Prices for superior cattle are always steadier in our markets than those for others. In England, however, the prices for American cattle have ranged from one extreme to another of late, having, within the last six months, reached the highest and also the lowest figures for the last three or four years. These extreme fluctuations have somewhat lessened shipments, and consequently weakened the prices of choice cattle here. Just now prospects for the summer trade are not very bright across the Atlantic.

The total number of hogs handled by Western packers from March 1 to date approximates 500,000 compared with 475,000 last year. At Chicago prices are about 30 cents per 100 pounds lower than those of a year ago, $2.50 per barrel lower on pork, 90 cents per 100 lower on lard and 60 cents per 100 lower on sides. There appears to be no prospect of a speedy advance in prices.

There has been a very considerable increase in the price of mutton sheep of late, especially in the West, owing to the supply falling short of the demand. Of late weeks the market has been steadily rising, until now prices are better than a year ago. There is a considerable increase in marketable lambs, probably because for the last year or two there was little profit in other branches of sheep husbandry. Owing to the greater number of lambs, prices, though still quite profitable, have fallen closer to those for mature sheep. Probably the agitation about admitting wool duty-free will induce flockmasters to give much more attention to the production of mutton sheep in the East for local markets and in the West for Eastern sale. Should the present rise in mutton sheep continue the probability will become a certainty.

A year ago broom corn was worth about $80 per ton; now it is worth from $160 to $240, and it may go higher. Seed which ordinarily sells for $2.50 to $3 a bushel, sells for $10, and there isn't enough of it at that. Most of the broom factories have shut down in this State and the West, owing to the scarcity and high price of stock. Several years ago so many went into broom-corn raising that the market was glutted and prices were unremunerative; then there was such a stampede out of it that last year not more than one-third of a crop, was produced, and collecting seed was neglected. Speculators soon "cornered" the short crop and at once began putting up prices, which could be done all the more easily as the old stock was exhausted. The high prices now are inducing so many to go into the business that the markets would soon be again overstocked were it not for the scarcity of seed.

The Mark Lane Express, in its weekly review of the British grain trade, said, last Monday: Trade in native wheats in London is very much depressed. In the Provinces the markets are irregular. The sales of English wheat during the week were 61,240 quarters at 30s 5d (92⅝ cents per bushel), against 51,083 quarters at 32s 5d (98⅛ cents a bushel) during the corresponding week last year. Flour is freely delivered. Prices are maintained, however, owing to the increased consumption arising from the scarcity of vegetables. Barleys are in buyers' favor. Trade in foreign wheat is without feature; sellers are firm and buyers are apathetic.

Brown's Bronchial Troches for Coughs and Colds: "I do not see how it is possible for a public man to be himself in winter without this admirable aid."—*Rev. R. M. Devens, Pocasset, Mass.—Adv.*

MARKETS BY TELEGRAPH.

SATURDAY, April 10, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 3⅞c. lower; 2 Spring, 3c. lower. Corn, ⅝c. lower. Oats, 1c. lower. Pork, 5c. lower. Cattle, from 20c. to 30c. higher. Hogs, 5c. lower. Sheep, from 10c. to 30c. higher.

WHEAT.—Unsettled; sales ranged: April, 72¼@73c; May, 77@77¾c; June, 75⅝@76⅝c.; No. 2 Spring, 72¾@75¾c. CORN quiet. Cash, 33@36¼c.; April, 33@33⅛c.; May, 37½@37¾c.; June, 37⅝@38⅛c. OATS—Sales ranged: Cash, 28⅝@28½c; April 28¾c., May, 29½@29¾c. RYE.—No. 2, 55¾c. BARLEY—No 2, at 60c. MESS PORK.—Cash, $9 20@9 25; May, at $9 25@9 52; June at $9 32½@9 40. LARD.—Quiet and easier; sales ranged; Cash, at $5 90@5 92½; May, $5 90@5 92½; June, $5 95@6 02½. BULK MEATS.—Shoulders, $4 00@4 10; Short rib sides, at $5 30@5 32½; Short Clear sides, at $5 65@5 70. CATTLE—Market strong. Shipping steers, $4 20@6 00; stockers and feeders, $2 75@4 50; cows, bulls and mixed, $2@4 20; bulk, $3 00@3 25. HOGS.—Rough and mixed, $3 00@4 25; packing and shipping, $4 25@4 50; light, $3 95@4 40; skips, $3 00@3 85. SHEEP.—Natives, $3 00@6 15; Western, $4 00@4 60; lambs, $4 85@6 12; Texans, $3 00@4 00.

DYSPEPSIA AND INDIGESTION

Are very prevalent in America, and it is not a matter to be wondered at that it is so. The American people eat a great deal of Bread. Much of the bread, while light and attractive in appearance, is injurious, because of the inferior elements used in the yeast.

Warner's Safe Yeast

is guaranteed to be Pure and Wholesome, *Health Preserving*, and Efficient.

Insist that your Grocer keep it.

LINSEED MEAL.

ABSOLUTELY THE BEST FEED FOR

CATTLE, HORSES, **CALVES,** SHEEP AND HOGS.

This Meal is the product of pure sound Flaxseed, Linseed being its other name, and is the most nutritious of all feed, because it contains the largest proportion of nitrogenous substance.

It is almost needless to say that, in order to derive much benefit from the use of Linseed Meal, it must be fed in quantity. At least one-half of all an animal consumes may safely and profitably be LINSEED MEAL.

☞Please send in a sample order or for circular and prices. Orders will be promptly filled by any one of the following parties:

Cleveland Linseed Oil Co., Cleveland, Ohio.
Toledo Linseed Oil Co., Toledo, Ohio.
Detroit Linseed Oil Co., Detroit, Michigan.
I. P. Evans & Co., Indianapolis, Ind.
St. Paul Linseed Oil Co., St. Paul, Minn.
Cincinnati Linseed Oil Co., Cincinnati, Ohio.

FLOWERS.

THOUGH there is snow on the ground to-day, it will not be long before the ground will be covered with nice, fresh, green grass; the trees will have on nice green coats, and the birds will be singing their songs. Then it will be time to see that our flower beds are made and seeds sown. Have you thought of it my Cousins? I am going to tell you about my first attempt at raising flowers. When Papa sent for garden seeds, he also sent for a dollar's worth of flower seeds. I made up my mind that I would have some flowers that year; at least there was nothing to hinder my tryiug to raise them. I was obliged to make my own flower beds, as Papa and Mamma were too busy to help me or give me any information on the subject. So I got my tools together, consisting of a wheel-barrow, spade and hoe. I spaded up places as large as I wished to have my beds. I then took my wheel-barrow to the wood-pile and got some nice rich chip dust which I mixed with the dirt just dug up. I next got some fresh loam which I mixed with that already on the bed. After the beds were nicely rounded up, I carefully broke all the hard lumps with my hands, leaving the beds smooth and mellow as any flower seed could wish.

The shapes of my beds differed. For my pansies I made a bed around a small evergreen tree, where it was nice and shady. For my cypress I made a round bed, in the center of which I placed a pole with cross-pieces nailed on the top to which I could attach strings. My sweet peas were given a round bed with three poles tied together at the top, to climb on. The other beds were square and rectangular. My dahlias had been planted in the front of the house, where they had the benefit of the sun. At an east door I had planted four o'clocks, and every morning as the door was opened, whiffs of scented air would enter, making the morning more delightful. How nice they would be at one's bed-room window. In one of the beds at the side of the path I had planted gladioli. They did very nicely. In the opposite bed were seen weeds instead of poppies. My small bed of portulaca was covered with blossoms. I also had a rectangular bed of a miscellaneous collection—balsams, batchelor-buttons, petunias, etc. They were all very nice until my family of ducks found the bed. Ducks make very nice ornaments for a barn-yard, but not for a flower-bed. My pansy bed was the nicest of all my flowers; they were perfect beauties, so large and handsome. In fact, I think I made a success of my flower raising. I hope the Cousins will have as good luck. Will some of the Cousins tell me how they save pansy seed: how to take care of hyacinth bulbs after they blossom? They never do anything for me after they once blossom. E. M. D.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I thought I would give you a little history. We are now living on a farm and we have 30 head of cattle and five head of horses. We are now milking five cows. My brother and I have two calves apiece. Pa is a great hand to take care of his stock, and he has got some rye in. The other Cousins are writing about cats, so I will write about our dog. His name is Tige. Tige can dance, waltz, laugh, shake hands, and speak for grub. He is a full-blood Shepherd. He is a very pretty dog and a very good dog to drive cattle. We think everything of him and would not sell him. IDA DAVIDSON.

Parker, Col.

[I hope you give Tige plenty of reasons for laughing and not one for crying. Most of us are like him in speaking for our dinner. I wish I could see him dance.—U. M.]

DEAR UNCLE MARK: I shall be 12 years old this month. I live in the center of Block Island on a small farm. My Papa is purser on the steamer George W. Danielson, which carries the mail to Newport three times a week. In the Summer I go to carry Papa to the steamer every morning and go to bring him home nights. I can harness a horse and drive one. I wonder if many of the Cousins can do that. We have four oxen, four cows, four calves, four pigs, one horse and a flock of about 60 Plymouth Rocks. I have a little sister Florence seven years old; she wants to join, but she cannot write. I will write more next time about the Island, if you wish me to.

Yours truly, SUSIE R. BALL.

Block Island, R. I.

[Florence can join too. Every farmer girl should know how to harness a horse, just as every farmer boy ought to know how to mend his mittens. Your Papa must be proud of his little girl.—U. M.]

TWO CASES IN VIRGINIA.

IN 1884 the mails brought to Philadelphia a grateful lettter from a gentleman of Lynchburg, Va., who told the story of the cure of his daughter by the use of the Compound Oxygen Treatment after being a sufferer from Inflammatory Rheumatism, beginning in her fourth year and lasting nine years. His letter was as follows:

"DRS. STARKEY & PALEN. Dear Sirs:—My daughter has been using your Compound for five weeks. Within a week, she began to show signs of improvement; since then her recovery has been remarkable. I have never seen anything to equal it. The action of the heart is quiet and soft; there has been no sign of rheumatism; she sleeps sweetly all night; has a fine appetite; has gained many pounds of flesh, and has considerable color; can walk all about the house, and has paid two or three visits in the neighborhood.

"Very respectfully, C. V. WINFREE."

About the time this young lady was finding relief from her inflammatory rheumatism, another lady suffering from consumption began the treatment. She had tried other remedies without success, and the prospects for her future were gloomy indeed.

In addition to her lung troubles she was a sufferer from curvature of the spine. Now, she can write herself a comparatively healthy woman, and the happy wife of the mayor of that city. Her story is told partly by her husband and partly in a letter from herself. We give her husband's letter below:

MAYOR'S OFFICE, LYNCHBURG, Dec. 15, 1885.

DRS STARKEY & PALEN, Dear Sirs—In stating what your Compound Oxygen treatment has accomplished for my wife, I am discharging a debt which I feel I owe to suffering humanity.

My wife has long been in delicate health, and since her seventeenth year has been suffering from a curvature of the spine. This greatly weakened her and occasioned much pain and excessive nervousness. Notwithstanding this she further exhausted her strength and prostrated her health by the usual round of pleasures of the fashionable world: late hours, parties, operas, and above all the german. The result of this course was that her health was completely prostrated, her vitality exhausted, and when on a Nothern trip in the summer of 1882, she contracted a deep cold, it settled on her lungs, and consumption was soon after the result.

During the early fall of 1882, she began coughing considerable, and finding that she was fast losing her strength and flesh, early in January, 1883, Mrs. Manson, then Miss Field, set out from her home in Culpeper, together with her aunt and Dr. Rixey, for Philadelphia. She was then excessively nervous, could not speak louder than a whisper, and was unable to sleep at all. She saw one of the leading allopathic physicians of Philadelphia, who told her she had consumption, and that she must leave at once for Aiken, S. C. By the middle of the month she was on her way there, and did not return until May. Though seemingly benefited for some considerable period during her stay, she had repeated spells which threw her back so much that when she returned she was much worse than when she left home. Soon after her return she went on to New York and consulted an eminent physician there, who advised the phenic acid treatment, which she continued to use during the following summer, notwithstanding its extreme, severity for some time with apparent success, though in the fall it seemed to lose its effect and she discontinued its use, returning to Aiken about the Middle of November, 1884. It was then she first used the Compound Oxygen, and when I went to see her at Christmas I found her considerably improved. I was prejudiced against the remedy, and advised her discontinuing its use, which in a great measure she did. From the beginning of the year 1884 she lost ground, till by February she was ill. I was telegraphed for and found her suffering greatly from billousness, fever and great weakness, I returned home to attend to attend to some business after a six days stay, only to be again telegraphed for. When she returned in May she was distressingly weak and thin, and though she improved some during the summer, she never was half so well as she had been the year before, and about the middle of September she took a violent cold, which confined her to her bed and promised very speedily to end her life. Indeed for one or two days we thought she would not live to see another; she did however, rally slightly, and towards the end of the month insisted on going to Philadelphia to try the Compound Oxygen treatment. I opposed the plan because I thought she could only live a very little while longer, under any circumstances, and a trip to Philadelphia would only wear out the sooner her little remaining strength; besides I did not think the Compound Oxygen had done her any good at home, and I did not think she stood any better chance by going there, but she clung to the idea as though it were her last hold on life. Finally I consented to her going only because I thought she would be better satisfied, and not because I had the slightest hope of her improvement. In her first letter after seeing Dr. Starkey, (it was only a few lines scrawled with a pencil) she wrote me that Dr. Starkey said she would have to stay there two weeks before he could say whether the treatment would benefit her. Before the time had elapsed she was feeling much stronger, and her appetite was far better, and by Christmas she could walk a dozen blocks. She remained in Philadelphia till April, having during that time but one bad turn, which, however, threw her back considerably. Since her return my wife has used the Home Treatment with continued benefit. Her weight in January, 1884, when she had been with you three months, was ninety-five and a half pounds, and that was a great improvement on her condition when she went to you. The last time she was weighed here her weight was one hundred and fifeen pounds. When she went to Philadelphia she could scarcely walk across the floor without assistance: she can now walk a mile and ride horseback for five miles. She then coughed nearly all the time, with a good deal of expectoration. Her cough is now much better, though it still clings to her, and the quantity of expectoration is comparative small.

Her great improvement seems to me almost miraculous, and I attribute it to the Compound Oxygen, aided by a systematic, prudent life, and the abandonment of drugs.

I fear I have written much more fully than you desired I should, but I have hoped that what I have said would be of some benefit to suffering humanity. With kindly remembrance, I am

Very truly, your friend,

N. C. MANSON, JR.

There are very many people interested in the treatment which has done so much for these two ladies in Virginia. If you wish fuller information send to DRS. STARKEY & PALEN, 1529 Arch Street, Philadelphia, for their treatise, which is sent free to every applicant.

THE SEVEN ADVANTAGES

OF THE

NEW YORK LIFE INSURANCE COMPANY'S

Nonforfeiting-Tontine Limited-Endowment Policy.

FIRST ADVANTAGE.—Insurance for a definite amount, or for an amount increasing with each premium paid, as desired.

SECOND ADVANTAGE.—A Definite Cash Endowment, and a Tontine Dividend, to Policies in force at the end of Endowment and Tontine periods, which periods correspond, and may be either Ten, Fifteen or Twenty Years.

THIRD ADVANTAGE.—Insurance for the full amount of the Policy, extended for as long a time as the value of the Policy will carry it, within the Endowment period, in case of discontinuance of payment of premiums after three years.

FOURTH ADVANTAGE.—A Grace of one month in the payment of premiums, during which time the policy-holder's security is unimpaired.

FIFTH ADVANTAGE.—Three valuable options, including cash value to policy holders who survive their Tontine and Endowment periods and keep their policies in force.

SIXTH ADVANTAGE.—Practical freedom of action with respect to occupation, residence and travel.

SEVENTH ADVANTAGE.—The payment of death-claims immediately upon the approval of the required proofs of death.

Do not insure until you have seen full particulars of this Policy. Do not fail to write the nearest Agent, or the Home Office, for such particulars—**at once.** The NEW-YORK LIFE INSURANCE COMPANY, **346 & 348** Broadway, New York City.

PERSONALS.

THE son of General Robert E. Lee, General W. H. F. Lee, just appearing on the horizon of national politics, is 50 years of age, a farmer, and bears a strong personal resemblance to his father, and is called "Runy" Lee, a name coming down from nursery days.

JOHN BRIGHT said to a lady who spoke complainingly of Mr. Gladstone: "Have your children ever seen Mr. Gladstone, madam?" "No," said the lady, wonderingly. "Then," said he, "I should advise you to improve the earliest opportunity to show them the greatest man England has ever produced."

"How many girls are there here to-day," asked Sam Jones of his Chicago audience for women only, "who were never saucy to their mothers? Stand up." "A woman," notes the reporter, "who was a girl 60 years ago, arose in one of the front seats and looked admiringly at the evangelist."

ATTORNEY-GENERAL GARLAND, who goes "no where," lives in a shabby-looking, old-fashioned frame house, back from the street, in a bare, dismal yard. His little, old-fashioned mother keeps house for him and explains her supreme self-possession, before high functionaries, by saying: "My dear, at my age there are no great men."

QUEEN VICTORIA strongly discountenances the slaughter of birds for the adornment of women. Women decked out, in savage fashion, with the skins of butchered birds, are frowned on at royal parties and receptions. The Princess of Wales, gentle and humane as usual, is the president of a society for the protection of birds, and several other ladies of the royal household, as well as a large number of titled personages, are also "patrons" of such beneficent organizations, whose membership is increasing rapidly in the United Kingdom.

Real Estate.

We offer this Season the Most VALUABLE NOVELTIES in
PLANTS AND SEEDS.
The sensation of the season is the *New Rose*, "*AMERICAN BEAUTY*," that will undoubtedly revolutionize rose-growing—*an ever-blooming Monthly Rose—as large, fragrant, and beautiful as the hardy or June Roses* that bloom but once a year. It is the most valuable new plant offered in many years; *Flowers* sell *at wholesale* at $1 each. Also, fine stocks of the new Roses, "Her Majesty" and "William Francis Bennett;" new Chrysanthemums, new Single Dahlias, etc., etc. Our importations of "Lilium Auratum," or "Golden-Banded Lily," the queen of lilies, is unusually fine. These, together with many other attractions, are fully described in our Seed and Plant Catalogue, which is very complete, handsomely illustrated, artistic, and of particular interest to all lovers of choice flowers. Sent free to all readers of the RURAL NEW-YORKER inclosing stamps to pay postage. Address

STOCKBRIDGE MANURES

Take the place of Stable Manure

No fertilizer can fully do this, but the Stockbridge Manures, being made for different crops, very nearly do so. They are very concentrated, containing all the elements required, in the right forms for each crop, and not only give crops an early start, but "back them up" throughout the season. Send for pamphlets.

To the Kainit Trade.

ROBERT S. CARR,
Admiralit Æstrasse 52.
TELEGRAMM-ADDRESSE.....ROBERT CARR.

HAMBURG, 1st of January, 1886.

The undersigned has the honor to inform all those interested in the KAINIT TRADE that he has been appointed by the STASSFURT SYNDICATE OF KAINIT WORKS, consisting of KÖNIGLICH PREUSSISCHES SALZWERK, STASSFURT, (The Royal Prussian Saltmine); HERZOGL. ANHALT. SALZWERK, LEOPOLDSHALL, (The Ducal Anhalt Saltmine); SALZMINEWERK NEU-STASSFURT, LOEDEBURG, (The Saltmine New Stassfurt); KALIWERKE ASCHERSLEBEN, GEWERKSCHAFT, ASCHERSLEBEN, (The Kaliworks Aschersleben), as their SOLE AGENT for the sale of this article to the United States of North America and Canada. As such, any orders will be carefully and promptly executed at the shortest notice and lowest possible current cost.

The demand for Kainit is steadily increasing, and the agricultural public, in becoming more acquainted therewith, is rapidly realizing the fact that the small cost of the article (it is the cheapest article for agricultural purposes) compares favorably with the results arrived at. As a standard Kainit is guaranteed to contain no less than 23 per cent. Sulphate of Potash and assuring all importers of the greatest care in executing orders entrusted to the undersigned, he is always ready to quote by cable or letter in reply to inquiries made direct or through his agents. Representatives for Baltimore; Messrs. PRIOR & VON COLLEN, 25 S. Gay Street, Baltimore. **ROBERT S. CARR.**

PERCHERON HORSES!
500 PURE-BRED MARES & STALLIONS
Of the most popular families, all recorded with **Extended Pedigrees** in the Percheron Stud-Books of France and America, now on hand at **Oakdawn Farm.**

The Percheron is the only French breed possessing a Stud-Book in both France and America where eligibility to entry is based on authentic pedigree. I have a few imported Stallions of individual excellence (but not eligible to entry in the Percheron Stud-Book) which I will sell at half the price of pedigreed animals of equal appearance. 100-page Catalogue, illustrated with engravings sketched by Rosa Bonheur, sent free. Address, **M. W. DUNHAM,**
Wayne, Du Page Co., Illinois.

CORN AND TOBACCO.

SECOND YEAR'S USE OF MAPES ON SAME TOBACCO PIECE.

Probably Largest Yield of Tobacco (Seed Leaf) in Mass. or Conn.

8,114 lbs. on less than three acres.—Cured well.—Quality good.—No stable manure used for seven years.—Havana leaf, 1,500 lbs. per acre on turf ground.

THREE ACRES, HAVANA LEAF, SEASON 1884.—SEED LEAF, 1885.

RILEY MAYNARD, South Deerfield, Mass., December 22d, 1885, reports:

I send you my report on my tobacco raised with your fertilizer the second year.

Last year (1884) I raised Havana Leaf on about three acres of *turf* ground. I used the Mapes' Tobacco Manure (Conn. Brand). I used about fifty dollars worth per acre and got 1,600 lbs. Havana Leaf to the acre.

This year (1885) on the same piece I set out Seed Leaf and applied the same Conn. Brand (Mapes'), 5,400 lbs., on the three acres (less 15 rods). I set out twenty-one thousand plants, or 7,000 plants per acre.

The crop cured well. I finished stripping it yesterday (December 21st.) It weighed 8,114 lbs.—over four tons on less than three acres. This is, probably the largest yield in Mass. or Conn. If there be any other Fertilizer that can beat it, I want to know it. There has been no stable manure on the ground for seven years.

I sowed the fertilizer, Mapes' Complete Manure for Tobacco (Conn. Brand,) on broadcast, plowing-in one-half, and harrowed-in the other half. I used Phosphate in the hill.

ONE ACRE, TURF GROUND, HAVANA LEAF.

I also raised one acre of Havana on turf ground, using one ton of the Mapes' (Conn. Brand). I got 1,500 lbs. of fine tobacco.

More Corn at less than one-half the cost as compared with stable manure.

[Extract from *Our Country Home*, February, 1886, Greenfield, Mass.]

Stable Manure vs. Complete Chemical Manures.—Experiment at our Country Home Grounds.

Experiment A.—Corn—In a field of 3 acres of Pride of the North corn, 2 plats of ¼ acre each were marked off. Soil, light and sandy. No. 1 received an application of 1½ cords of stable manure, costing $8 per cord on the ground, or $12 for the ¼ acre. Product, 19 baskets sound, and 2¼ baskets soft corn, or 76 baskets sound and 9 baskets soft corn per acre. No. 2 received 200 lbs. Mapes' Corn Manure, costing $5.25 for ¼ acre. Product, 22½ baskets sound and 1¼ baskets soft corn, or 90 baskets sound, and 5 baskets soft corn per acre. The stable manure was spread broadcast and harrowed-in with a wheel-harrow, as was 100 lbs. of the Mapes Manure. The other hundred lbs. was sowed when the corn was one foot high and cultivated-in. In all other respects the treatment of the two plats was exactly alike. The corn on stable manure produced a little the heaviest fodder, while that on the Mapes' averaged one week earlier in ripening. Both plats withstood a severe drouth well; $21 worth of Mapes' produced 14 baskets more of sound corn than $48 worth of stable manure.

E. A. JAMES, Superintendent.

Mr. James reports: "The Mapes' Corn Manure gave us most satisfactory returns. We used it also on one acre in comparison with stable manure (also one acre), same quantities as above, with same difference in favor of the Mapes' Corn as in the above experiment.

Now is the time to Top Dress Grass Lands and Lawns, Fruit Trees, Strawberry Beds.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XLV. No. 1891. NEW YORK, APRIL 24, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Vineyard.

CAYUGA GRAPE.

We received last Fall, specimens of the Cayuga Grape (Fig. 167), from the originator, D. S. Marvin, Watertown, N. Y. Bunch long, not shouldered; berries black, with a heavy bloom, adhering firmly to the peduncle; from half to five-eighths of an inch long. Skin thick, tough, but pleasant, even when eaten close. Seeds one to two, rarely three in number. Pulp soft, tender, juicy, sweet, vinous and of high flavor, separating easily from the seeds. Eaten October 10—in fine order.

Pomological.

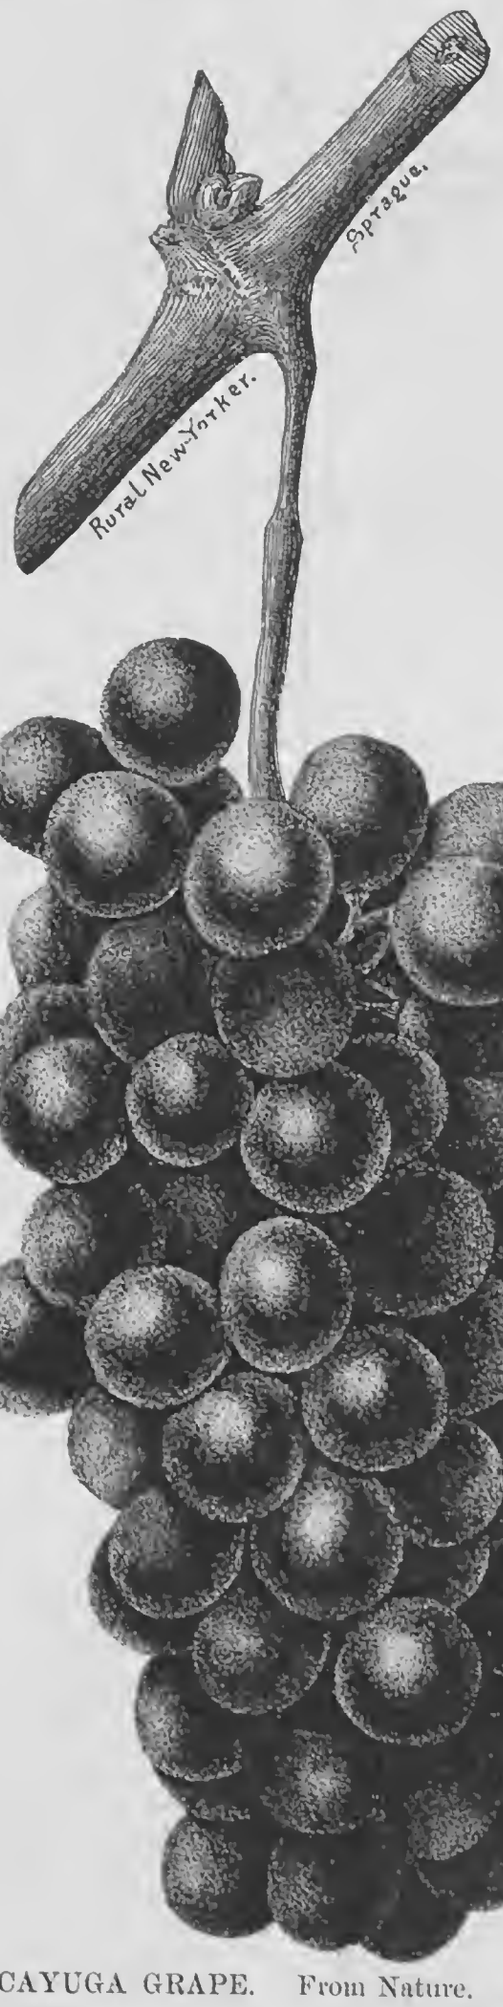
OLD FRUITS UNDER NEW NAMES.

It was with considerable surprise that I read the article of C. M. Hovey under the above heading, in the RURAL of Feb. 13th and 20th last, and I am still more surprised that so usually discreet and careful a correspondent as Horticola should accept (page 219) the same premises and conclusions. My surprise is not that they reverence old and honored names—we all very naturally do so—but that they reason and draw conclusions from the unwarrantable assumption that the American Pomological Society claims the right to dictate a change in such names; and is, in fact, doing this through its Committee on Revision of its Catalogue, and perhaps otherwise. As I understand the matter, the utmost that the society or its committee does or can claim is, that its duty in this direction is to register the decisions and practices of the pomological public, so far as names of fruits are concerned; and, as leading and influential pomologists, to indicate, in their transactions, the most effective means of giving system, dignity and something of science to the nomenclature of fruits. In doing this, the fact has become patent that there has been such free and inappropriate use made of certain words, such as Pippin, Beauty, Favorite, Belle, Beurré and many others, that they have, in part, if not wholly, ceased to possess significance as attachments to the names of fruits, and, as a natural sequence, there is a notable and obviously increasing tendency on the part of the public to lop these off as needless excrescences. The Revising Committee seems to have noted and acted upon this fact, but in so conservative a degree that the late Charles Downing, in a letter to the writer, remarked that they might properly have gone even further.

I understand the mission of the American Pomological Society, in this matter, to be precisely identical with that of the orthoepist, in the spelling, defining and pronunciation of words—to register the practices of the best writers and speakers, and I fail to see that the practice objected to has in any case transcended this rule. The rules of the society declare explicitly the right of the originator to name his origination; but, nevertheless, the society declares that if an objectionable name be bestowed, it will refuse to recognize or consider the same, until the objectionable feature shall be abated. So the public constantly and freely exercises the same right. In common parlance, Duchesse d' Angouleme is simply Duchess; Williams' Boncretien is, and doubtless always will be, Bartlett; Hovey's Seedling and Wilson's Albany Seedling are Hovey and Wilson; Stump the World is Stump, while Miner's Great Prolific is simmered down to Miner, and so *ad libitum*.

This nuisance of long, sensational names has grown with the growth of pomology, too often of late apparently for deceptive purposes, till it has become irksome to the public, who are vindicating their power, if not their right, to lighten the tiresome incubus.

South Haven, Mich. T. T. LYON.



CAYUGA GRAPE. From Nature. Fig. 197.

JAPAN CHESTNUTS.

In a late RURAL, we are told "to be careful about commending the Japan Chestnut too highly." That is a safe rule to apply to all new fruits. A variety of circumstances, such as soil, climate, location and treatment, will affect either favorably or otherwise a new or untried kind. If those who have grown the true Japan Chestnut would tell us their experience through the RURAL, a large amount of information as to the soil, climate and location where the trees succeed would be accumulated. Their growth and productiveness have been satisfactory here. We have imported young seedling trees direct from Japan, some of which bore very large, handsome nuts, while others were smaller. We also imported grafted trees, the fruit of which also varied much in size, quality and time of ripening.

From those which bore the finest and best fruit, we cut cions and grafted them into common American chestnut trees about eight feet from the ground, and in three years they produced some very fine fruit. We have imported direct from Japan some very large and fine nuts measuring five inches and upward. These we planted in the greenhouse in three-inch pots. They grew finely and were one foot high by the time the weather was mild enough to transplant in open field, and three years afterwards they bore a dozen or more to a tree, large nuts which ripened earlier and sold for a higher price than the Spanish and French sorts, bringing 50 cents per quart in market, while the others sold for 25 cents. From this it would appear that there must be several varieties in Japan not all of uniform size and quality. We have succeeded best by planting large seeds of the best quality, or grafting from the best trees, as the seedling trees that we have imported have not always produced very large fruit. WILLIAM PARRY.

Burlington Co., N. J.

THE BEST APPLE FOR NEW ENGLAND, AND WHY.

Almost every locality has some variety of apple which is most profitable and has the largest run in the market orchard. Thus in New England it is the Baldwin; near Philadelphia Smith's Cider; in the Mississippi Valley, Ben Davis. The law of adaptedness must settle which has the pre-eminence. In New England, the Baldwin unquestionably is the market apple. Why? 1st. It is a good grower, making a well-shaped tree. 2d. It is quite productive in alternate years, and with high culture and proper thinning every year. 3. The fruit keeps and ships well, and is also desirable in shape and color. 4th. It is a variety widely and favorably known in the markets of the world. P. M. A.

Middlefield, Conn.

Horticultural.

HARDINESS OF PISSARD'S PLUM, ETC.

In a late RURAL, Mr. F. K. Phœnix reports that Prunus Pissardii was killed by the cold last Winter at Bloomington, Ill. This is nothing remarkable, as I think it will be found killed the present Winter all over the northwestern prairie country. I had some fine specimens two years old, that I neglected to protect, and they are killed to the ground. It is called perfectly hardy by Eastern nurserymen, who offer it for sale; but I do not think there is a live specimen in Iowa or Northern Illinois that has stood out the present Winter unprotected. So far as it has been tested here, it is no hardier than an ordinary peach tree. Prunus Simonii is hardy here, as is also the double-flowering plum Prunus triloba. The RURAL asks as to the severity of the climate of Bloomington, Ill., in comparison with that of Painesville, Ohio, or Rochester, N. Y. Bloomington is in a prairie country, while Painesville and Rochester are not, and when the "blizzards" come over the prairie, and the mercury falls to, say, 30° below zero, it is much more severe on trees, shrubs and plants than it is when the air is still, even if the degree of cold is the same. Another reason why it is more severe in the West is because of the lack of snow, for if we have a heavy snow it does not lie still so that it affords any protection to plants: but it blows into drifts, and the ground freezes as hard and deep as if we had no snow. The peach winter-kills in all the prairie region of Iowa, Northern Illinois, Wisconsin, Minnesota, etc., while in the same latitude in Ohio or New York, it is grown with considerable success. I have not tried the Japan Chestnut, and do not believe it would be hardy here. H. A. T.

Crescent City, Ia.

THE EARHART RASPBERRY.—I have scanned and sifted all the statements I have

found about this new wonder, and managed to draw out some chunks of eaution. For instance, is is stated that 16 gallons of berries were picked about Sept. 1st from two rows six or eight rods long, in this neighborhood. That is more than I have ever picked at any season from the same amount of ground. And then we are informed that one man here frequently borrowed a horse and buggy to go after a few berries for a sick child, proving they were not on the market, although there is more than an acre of plants. Moreover, personal inquiry elicits the fact that no berries were ever marketed out of season from that patch, and the knowledge of this has saved me $3 at least. C. P.

Kirksville, Mo.

Arboricultural.

THE HARDY CATALPA.

Its hardiness—value; proof that it is distinct from the Eastern Catalpa; history of Mr. Douglas's connection with it.

READERS of the RURAL NEW-YORKER are well aware that we have both the common Catalpa and the Hardy Catalpa (C. speciosa) at the Rural Grounds. On page 717 of the RURAL for 1884, we gave careful illustrations of the flowers of each, and pointed out the differences between the flowers, time of blooming, leaves, habit and hardiness of both kinds. The following interesting and instructive letter from the veteran Robert Douglas, of Waukegan, Ills., to our friend T. T. Lyon, of Mich., is presented to our readers with the permission of both gentlemen.—EDS.

"I have often felt like getting out of patience with some of the Eastern writers for their prejudice against this Western tree; but when I consider that there are only three writers, and they are all my personal friends, and know that they are all perfectly honest in their convictions, and are really friends of the West as much as of the East, I am convinced that local prejudice does not enter into their minds at all. I have traveled long journeys with two of them in the West (Meehan and Hoopes), climbed the mountains and slept on the plains with them, and it is a common saying in the West that you never know a man till you have camped with him on the plains.

The third writer, A. S. Fuller, I am not acquainted with, but I should like to show him, near his old home in Wisconsin, a Western Catalpa standing on a bleak knoll, where it has stood 12 or 15 years, and have him count the years' growths and see how it has stood the terrible Winters; while the so-called iron-clad apple trees have died outright. After that, with friends Meehan and Hoopes, we might go down to Princeton, Illinois, and put a measure around a Western catalpa tree, grown from seeds collected by Arthur Bryant at New Madrid, and they would find that it measured over three feet in diameter; stump high. They would also learn that Eastern Catalpas were planted freely in Princeton, and that many years ago they had all succumbed to the severe Winters. I would take them to St. Louis, where Eastern men all visit Shaw's Garden: at the end of the street ca track on our journey thither, I will show them a street planted with the Eastern Catalpa, where they can see how the poor misshapen trees have suffered from killing back during severe Winters.

I will give you a short history of my connection with the Western Catalpa: During February and March, 1877, I received letters from E. E. Barney, of Dayton, Ohio, Dr. Warder, of Ohio, Suel Foster, of Iowa, and Prof. C. S. Sargent, of Massachusetts, all urging me to grow the Catalpa speciosa in large quantities, believing it to be the most valuable tree. They did not all call it Speciosa, although Dr. Warder had given it that name in 1883. Mr. Barney called it the Early-blooming Catalpa, owing to its flowering three weeks earlier than the common sorts. [The Hardy Catalpa blooms at the R. G. while the common is in bud.—EDS.] Suel Foster called it the Hardy Catalpa, for the reason that his partner came into the office one morning in Spring and told him they had two kinds of Catalpa. Mr. Foster dissented; they went into the nursery, and found that one lot was uninjured and the other lot killed to the ground, and that the uninjured had come from Indiana; the tender ones from the East. I traveled weeks with Dr. Warder studying the two trees. I confess I was surprised when I saw the marked difference, and wondered how botanists had failed so long to make a distinction. It seemed to me that any man that could distinguish the difference between the bark on a White Elm and an American Beech could not help seeing the same difference in these two trees.

Mr. Bryant went with us (Dr. Warder and myself) to examine a grove of a few acres near the Illinois Central Railroad down in La Salle County, Ill. The Doctor said he had not seen a plantation in Europe or America that would compare with it. The owner told us that he had sent down to South Indiana and had the seeds collected in the woods, and was growing them for fence posts, as he found that oak posts rotted. We went home with Mr. Bryant, and then went through Illinois, Iowa and Nebraska, wherever we could learn that the trees were growing. I left Dr. Warder in Nebraska, he going to Wyoming and through Kansas and Missouri, studying these two trees. I found the Eastern kind showing the effect of severe Winters. I met Mr. Barney by appointment in Chicago the week after I left Dr. Warder. He told me how he labored to introduce this tree, and the importance he attached to it, and I had previously learned from Dr. Warder how Mr. Barney had spent both time and money lavishly without any pecuniary interest in it. I started the next week with one of my sons for South Indiana, Western Kentucky, etc. We explored the woods. We hired Germans, Irishmen, poor whites and negroes, and saw the the seeds taken from the native trees. We remained as long as we could possibly endure the hardship, and then grew the trees by the millions, advertising them as hardy up to 42 degrees north latitude. About three years ago, finding them hardy further north, we advertised them as hardy up to 43 degrees. When I was East last Summer, two letters followed me with an article clipped from the N. Y. Sun, telling how Western men were flooding the West with this tree which is not hardy. I confess I was annoyed, as both these letters were from Eastern men expressing sympathy with the poor unfortunate West, and kindly sending me a copy of the article.

Many of our Eastern friends do not understand the West. The East proper, covering only a limited space set among hills and cities and lakes and rivers and adjoining the seaboard, is all nearly alike, and what is hardy in one part of it is comparatively hardy in all. Not so in the West; and this is why they make what seems to us most glaring mistakes. It might be said that there is no tree hardy in the West! True, there are a few species, notably the Red Cedar, the Box Elder and the Black Cherry which grow from Florida far up into the Northwest, the two first named up into Northern Montana and beyond. But do any of our Eastern friends think that seeds of these trees collected in Florida would produce trees that would be hardy here? Let us not be severe on them if they do. I had lived a quarter of a century in the West before I knew to the contrary. I made the first discovery when I purchased 10 bushels of Red Cedar berries from the South. They germinated freely and exceeded our Northern seedlings in growth; but killed back in the Winter. I sold them at half-price to a nursery-man that had a Southern trade; but when we shipped them at three years old, they showed so badly that we sent them to him only charging him for the boxes. Another case out of several I will mention. We bought a large lot of Black-walnuts, grown at Makanda, in our own State. They were planted side by side with a lot collected in our own locality. In the Autumn, standing side by side, the Makanda seedlings were double the size of ours. The next Spring ours were alive to the terminal buds; the Makanda plants were killed to the ground.

Mr. Josiah Hoopes will not admit that there are two species of Catalpa. Mr. Fuller says, in his work on forestry, that the question whether our Western tree is a species may well be left for scientists to decide. Surely Mr. Fuller must know that it has been decided by a scientist who stands in the front rank both in this country and Europe: Dr. George Engelmann, has decided it, and named the hardy Western species Catalpa speciosa. Mr. Fuller in his new work, referring to this "so-called Western Catalpa," does not even notice the difference in the bark, although he has seen both trees when of large size. I have a letter from Richard Sykes, owner of the large plantations at Larchwood, planted by the veteran Jesse Fell, and in it he says: "The Catalpa speciosa trees seven years old, flowered and bore seed which ripened thoroughly; the pods were 18 inches long. This is a good showing for latitude 43 deg. 30 min." I have a letter from F. W. Woodward, of Eau Claire, Wis., former editor of the Horticulturist, in which he says: "Catalpa speciosa planted in '84, is seven feet high and 2½ inches in diameter. The ends of the shoots were killed back last Winter (45° below zero) about three inches only. I think I can report it as hardy here. Norway Spruces were so severely injured alongside of the catalpa, that they made no growth the past Summer; presenting only a rosette of buds at the ends of the branches." Surely no tree ever had such an introduction in seven short years as the Catalpa speciosa of Warder. We have flattering reports of it from the East Indies, China, South Africa, Australia and Europe."

SHRUBS SUITABLE FOR HEDGE PLANTING.

Requirements for a suitable hedge plant; the Japan Quince; the sweet briar; the barberry; the honeysuckle and deutzias; the privet; an easily made hedge.

ONE practical way of multiplying and conserving leafiness, and so of remedying the serious faults about which even jocose Dr. Holmes speaks seriously (see RURAL of October 24, page 711, foot of first column), would be the general planting, along permanent lines of wire fence, of hedge plants of some easily grown and kept and enduring sort which, even if left untrimmed, will not sprawl or sucker or attain over 10 feet in hight. It need not be thorny, or so stiff as to stop breachy animals, as one barbed wire within it will do this perfectly, if stretched 30 to 35 inches above the ground. Yet a certain stiffness is necessary, or pigs, dogs and poultry may push through at the base. A wire near the ground will help to prevent this, and if the plants are either set close or headed down close to the ground until thick with shoots, there will be no trespass of the sort. Even breachy boys or men will go far around and resist much temptation before undertaking to get over a thin 4½ foot hedge that has a barbed wire in its heart.

Other requisites in an ideal hedge-plant are that it be not liable to be browzed by cattle, that its stems be firm and permanent, and its leaves evergreen, or nearly so, to give better shelter to the land and its workers on each side. Ease of propagation and ready growth are important essentials. Beauty of foliage and trimness of growth are also worthy of consideration. Hardy shrubs that combine more or less of these requirements are the common privet, the barberry, the sweet briar, the Japan quince, the shrub honeysuckle and the taller deutzias. They have merit in about the order named. The Japan quince is exceedingly handsome in flower, and it flowers well even where closely trimmed. Its leaves, too, are of a rich green. But its stems are straggling, very pliant and short-lived individually. It is also liable to be cut off by the borer, and it suckers occasionally. It is also rather expensive.

The sweet briar has its merits? of thorniness, and of very agreeable fragrance, and very numerous stems; but it is liable to lose its leaves in hot, dry weather, and they are pallid in color.

The barbery is handsome, dense, enduring, and will grow and live in the poorest, driest soil. It is prickly too. It is doubly handsome in flower and fruit; but trimming checks its flowering and robs it of beauty. It, and the sweet briar can be grown from seeds, but not with certainty, and they require some years to make a full hedge.

The honeysuckle and the deutzia are best adapted for fancy hedges—to contrast with a dark bank of evergreens, or to dot into a hedge here and there for pleasing variety, brightening up a dark line.

The privet posesses the most points of merit, indeed all of the essential ones. It grows as well and as surely from cuttings as any willow. The plants should be pushed down firmly into the soil in Spring—it having been well cleaned and mellowed in the Fall—and at any distance apart under eight or ten inches in the line of the hedge. Its cost is, therefore, very little. It is nearly evergeen, and hardy throughout the North, grows up rapidly but stops at about ten feet. The Californian, or oval-leafed privet has leaves still more glossy and of lighter green; it is rather less hardy.

A friend here completed a good chicken-proof hedge of common privet within one week. He stretched three wires about eight, 16, and 30 inches from the surface, the upper one barbed. Then, having plenty of young rods of privet in a hedge-row, which had been headed down close and then purposely left to make a full growth without any trimming, he cut quantities of these, from two to four feet long, and pushed their somewhat sharpened ends about six inches down into the well mellowed, and cleaned soil along the line of the hedge, first passing them through the wires from alternate sides, so as to have a weft like that of a basket. They were put in about two inches apart, to debar young chickens from getting through. It was an effective hedge at once, and was soon "a thing of beauty," as well as of use. The shelter afforded by such hedges is worth many times their small cost, while they are one of the greatest of landscape adornments, and essential to cozy comfort about a country home in our climate.

Tyrone, Pa. W. G. W.

Sheep Husbandry.

Notes from the Rural's W. N. Y. Farm

FEEDING LAMBS.

HOW OFTEN SHALL WE FEED?

IT is claimed by some that twice a day is sufficiently often to feed; that by feeding the hay and grain near together, and these feeds as nearly 12 hours apart as possible, the lamb has ample time to re-chew its food and the stomach time to rest before the next meal, and that the lambs will both gain faster and make a larger gain for the food consumed. This is a fallacy that works to the injury of every one who may follow it. Ruminating animals are seldom without food in some of the compartments of their stomachs, unless fed on starvation diet, which no one would recommend, at least for fattening animals, and no matter how often fed, the food, as a rule, does not pass into the fourth or digesting stomach until after it is chewed the second time. And if the lamb is fed, as it should be, at least seven times, it will not spend over seven or eight hours in eating, leaving at least 16 hours for rumination and rest of the stomach, which is ample. And as the interval between the evening and the morning feeds must necessarily be not less than 10 or more hours, the first feeding should be not later than six o'clock (five would be better), and the shepherd will be very sure to find the lambs alert and showing by their greediness that they have had ample rest and are ready for a good, "square meal." We prefer hay for the first feed, so that it may be quickly eaten, the stomach quickly filled and the coarser food ready to mix with the grain ration and returned with it for remastication. If the hay is good and only a proper amount be given, it will be eaten in one hour, and the sheep will be ready for their grain. After this is given, the water troughs should be looked after and replenished, if empty, and the lambs then left in quiet until half-past nine, at which time roots should be fed; these should have been made very free from dirt and cut fine, but cut into irregular pieces or cubes in preference to pulping or being cut into slices. We use a cutter with circular knives, which in cutting the roots break them into pieces the size of hickory nuts.

At noon the racks should be filled with good, bright straw. If grained as high as is advisable, they will eat a large proportion of this; especially is this true if the straw has been barn-housed, for no matter how bright it may be or how well kept in the stack, they will not fail to detect the difference, and will show their preference, by the larger consumption of that barn-kept. The troughs should now be looked over and refilled with water, and the lambs be left undisturbed until (where roots are fed, as they should be, twice daily,) three o'clock when the second feed should be given. At five P. M. the racks and grain trough should be swept out, and the second grain ration given, and at six the racks should be filled with hay, or, if desirable to feed corn fodder, that should be given at this time. If the second feeding of roots be omitted, which we do not by any means advise, the afternoon grain-feed may be given at half-past four, and followed with hay or other forage at half-past five.

Thus it will be seen that we have marked out seven distinct feeds each day, and have provided for keeping the shepherd busy and "at his post." That lambs will eat more when fed often we have not the least doubt, but that they will make a gain corresponding to what they eat, and more, too, we have proven by careful experiments more than once, and this course will, by the more rapid gain of the lambs, more amply repay the shepherd whose heart is in the work and who begrudges no labor if he can see the lambs "doing their best."

Our friend J. F. Kenelig, of Cumberland Co., Pa., wishes to know why sheep lose their wool, it commencing to loosen around their necks and along their bellies? There is only one cause of this. The sheep at some time have been losing flesh, and they are now gaining. The great difficulty with most sheep-keepers is in allowing the sheep to run too long at pasture without grain. After a severe freeze the grass has but very little substance, and although the sheep may fill themselves so as to look full, they are rapidly falling away, and when put into winter-quarters and well kept, they begin to thrive and this starts the wool more or less. There is no remedy only to grain a little while they are at pasture, or put them into the barns sooner.

Our good friend M. M. Willson says he followed our directions in papering and sheeting the outside of his barn, and still when the mercury went 10 degrees below zero, the wa-

ter froze solid in the troughs, and he asks if a barn 40x60 with weather-boarding well preserved with paint, cannot be made warm enough, with tarred paper and an extra boarding over that, not to freeze. It certainly can, though we should try putting on one thickness of tarred paper, then furring out with inch strips over the joints of the paper, and over these, if necessary to keep the cold out, putting on a second thickness of the paper, and over this the weather-boarding. It is certainly much cheaper to shut the cold out than to try to warm the barn with the sheep after the cold gets in. We suggest that, no matter how closely or warmly the sides may be covered, unless there be an air-tight ceiling overhead, it is impossible to keep the stables sufficiently warm. Was not that the trouble with the place in which the sheep are now kept?

As we sit writing, we see two men going by with manure that cost them 75 cents per load. One-third is shavings and it must be hauled three miles from the stables where made to the fields on which it is to be used. These men both use tobacco, it costing each not less than $6.00 per year, and yet neither takes or reads the RURAL, because "it costs so much," and he can't afford it. And then neither believes in "high-pressure farming," as he calls our method. We wonder if the time will ever come when farmers will spend half as much to feed their brains as to minister to a depraved appetite.

Dairy Husbandry.

COST OF MILK AND OTHER FIGURES.

J. N. MUNCEY.

DURING the past two years I have kept a set of double-entry farm books, and, aside from this, endeavored to determine by weighing hogs and calves, just how many pounds of beef and pork were made. Having these exact figures, and knowing the feed consumed by calves and the number of pounds of pork made from a bushel of corn, I can readily approximate the quantity of feed consumed by the cows, and in this way obtain a quite reliable figure on the cost of milk.

I summarize what has required considerable work in reviewing the entire "Produce Account" from my ledger:

Corn consumed, Meh. 5, '84, to Jan. 1, '85	417 bu., at 28c		$116.76
Oats consumed (approximate)	121 "	at 20c	24.20
Off-meal consumed	1,647 lbs.		20.29
Bran consumed (actual),	26,722 "	at $10 per ton,	135.00
Hay " (estimated),	28 tons, at $4 "		112.00
Total			$408.25

Pounds milk made from Meh. 5, '84, to Jan. 1, '85	135,719
Days' milk of one cow for that period	6,019
Average number pounds per cow per day	22.4
" " cows for time mentioned	20
Number acres Timothy pasture	40
Rent value per acre here	$2 to $2.50
Pounds increase in live weight of cows	1,700
Value of increase per lb., 3½ to 2c	2½ average.

Deduct $42.09 as the increase in beef value of the cows, and add $80 for pasture, and there remain $457.40 as the cost of 135,719 pounds of milk. This is about 33 cents per 100 pounds. The cows are grades, natives and full-bloods. They were fed bran all Summer. Some of the new milk was fed to calves, some used in the house and the remainder sold to the creamery; 112,137 pounds sold for $804.60, and the return skim-milk (80 pounds for every 100 delivered) was worth about 25 cents per 100 pounds. I have made no allowance in these figures for cases of abortion, damaged udders, or deaths by disease or accident. I omit purposely the cost of labor, because every man can approximate that for himself. I have had four cases of abortion in two years. One of that number was more properly a case of premature birth, the calf being raised and sold for veal.

The average weight of the cows is, 1,190 pounds. During the Summer the cows received a moderate allowance of bran only. This saved many hours' labor in driving them from the pasture. Very rarely was it necessary to go after them. During Winter they were fed liberally in a barn, the temperature of which is 18° to 22° above zero when the thermometer is 35° below outside. I hardly think the average temperature in the barn would exceed 35° F. for December, January and February. They were turned out only a few minutes during the very coldest weather. They were watered three times a day—that is best. The water was not warmed; but it ought to have been. Its temperature was not much above 40° on an average, I think. The feed was not always mixed in scientific proportion. From these figures and facts, one is enabled to get a more definite idea than experimental reports contain, because of the short time the experiments are conducted. To obtain any practical benefit from notes of this kind, each farmer should do a little private figuring to learn what his own herd is really doing and how it compares with this.

Jessup, Ia.

The Herdsman.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

SALT FOR STOCK.

I AM satisfied that the system of spasmodic salting, as practiced by most farmers, is a mistake. Too much is eaten at a time, and then a fearful thirst is caused. It seems to me that any person who has ever eaten a great deal of salt meat and then drank the well dry, would realize how a lot of salt now and then would affect stock. It is liable always to cause diarrhea, as it is an irritant in the stomach, and there must be a spasmodic effort of nature to throw it off. The large amount of water drank afterwards, if it can be had, is also injurious, and in winter time must chill the whole system. Many people think all of the old brine must be put through the cows somehow, either by mixing their food with it or sprinkling it on their provender. This is a most foolish thing to do, as it is liable to cause abortion, and the brine is worth more on the asparagus bed, or to kill thistles, or in the compost heap, than it can possibly be for stock. It is a doubtful question whether stock or people require salt at all, and if they do, it is a *very little* at a time—only a lick or a pinch, as the case may be.

OH, FOR MORE MILKERS!

Milking is getting to be a lost art. Hired girls don't know how, or are above it, and hired men won't. It will not be long before we shall have to do all of our own milking. In strictly dairy districts everybody milks; but where mixed husbandry is followed it is almost impossible to hire a good milker. Milking is an art. Families and races may be born to it, but to make a good milker out of common talent is hard work. Where time is given to the hired man, *after tea* and *before* sundown, to do the milking, there should be no grumbling. Young people ought to understand that on the farm to be able to milk well is really an accomplishment, and one who can and will milk can always command better wages. A good milker can get one-third more wages where a nice lot of cows are kept, and he will more than make it up. A poor, slow milker will spoil cows, however good. With skill there should be a kindly manner, as a spiteful, mean person about cows is a curse to cows and owners. It won't be long before we shall have to import milkers, just as skilled labor is sought for in the mechanical arts, or for special work.

FEED FOR WORK HORSES.

Twelve quarts of oats a day is as much as any horse needs or can digest well for work on a farm. With this the horse wants only half the hay usually fed. He will do better and do more work on a small amount of hay than when given all he will eat. Cut food with meal is the most economical, and horses will do the hardest work on this food and keep in better condition than on oats. Grain is much cheaper in this section than hay, and if plenty of bran be mixed with the grain very little hay need be fed. Horses will do well on oats and bran, or on clear oats. I have a horse which has been doctored for the heaves, which has lived all Winter on 12 quarts of oats. He looks well and feels fine. My father once worked a "heavey" horse a whole Spring on nothing but oats soaked in water, and he gained all the time. When fed hay, he could hardly walk, the disease was so bad.

HINTS ON FEEDING.

I have found out that there is no money in trying to fatten old cows or sheep, or in attempting to winter them unless they are specially valuable for breeding. I fed an old cow, and did not get half pay for the meal and oats she ate. I have wintered some old sheep to get one more lamb, and they have been fed to keep them in as good condition as possible. I found the barn was too cold, and moved them to the pig-house which is much warmer, and here they improved. I doubt if they would have stood the cold. Two of them now have lambs, and when these were born they were fat and strong. It was oats, wheat bran and roots which made them so. The mothers had plenty of milk and no cake in the udders. If they had been fed corn enough to have kept them up, and to have developed such udders, they would have been feverish, and the udders would have been swollen and sore. Two years ago I was taught a valuable lesson in regard to feeding corn plentifully to ewes which were going to have lambs. It won't do. In some cases the milk would not start at all, and in others the lambs died because, although the ewes owned them all right, which deceived me, they would not let them suck, as their udders were so sore. In many cases the ewes had to be held whenever they got any milk, and it was some days before they would stand for them.

Horseman.

TYING UP A HORSE'S TAIL.

FIGURE 175 shows how our friend, Frank H. Rood, of Wyoming County, N. Y., ties up a horse's tail so that it looks as if it had been docked. With a brush separate the short hairs at the root of the tail from the long ones,

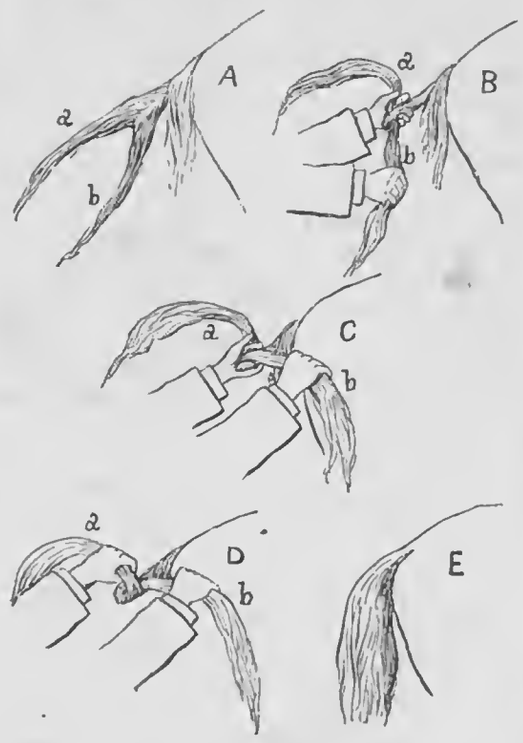


Fig. 175.

so that half will fall on each side of the dock. Then divide the long hairs into two equal parts, as shown at A. Turn part *a* up the dock towards the tail and hold as shown at B. Now bring *b* around under the dock and between it and the left hand, and over, as shown at C. Next bring *a* under the dock and over part *b*, as shown at D. Take hold of *a* and *b* with the hand close to the dock, as in D, and don't let go until the parts *a* and *b* have been wound up and the dock tied. Wet the ends of the hairs and tie two knots or a double knot: now brush the short hairs over the dock and you have a bob-tailed horse, and a much better-looking tail than one that is tied up sore-thumb fashion—and it is out of the way of the mud, too.

Field Crops.

CORN CULTURE.

THE best corn-grower in this community never fails to make a good crop. Sometimes his crop is much better than at others. This is due to the seasons, his cultivation being always the same. If the field he wishes to put in corn is weedy or sod land, he breaks it the Fall before, and then again the following Spring, deeper than the first time, as early as he can plow. Just before planting, he breaks it the third time still deeper, harrows, rolls and thoroughly pulverizes the soil to the depth of 10 or 12 inches. The land is then laid off four or 4½ feet each way and planted. The growth is thinned to two stalks in the hill when hand-high. When it is three or four inches high, he plows both ways deep and close to the corn. Two or three weeks later, when the corn is 10 or 12 inches high, he cultivates it shallow both ways, and then leaves it to the mercy of the seasons. In giving it the last cultivation he endeavors to leave the ground as perfectly level as the implements at his command can make it.

He never allows a plow to go in his corn field after the corn has got knee-high. If weeds appear here and there they are chopped out with a hoe, disturbing the soil as little as possible. His theory is this: Thorough and deep preparation of the soil, that the moisture may rise easily by capillary attraction, when most needed, and that the young roots may be able to spread out in every direction in search of nutritive food. The first plowing may be deep, because at that stage of the corn's growth the young roots have not spread far enough to be disturbed by the plow. The last plowing should be shallow that the roots may not be molested. The ground should be left as level as possible that the spring and summer showers may moisten the soil uniformly; besides, the crop suffers much less from drought when the surface is smooth and level.

There is nothing difficult about this method. It is plain and simple, and will give to those who test it very satisfactory results. The man lives on a poor farm, yet in corn growing he excels his neighbors who own very fine land. The old farmer who has been in the habit of putting in the double-shovel up to the beam, while both plowman and horses were nearly suffocated beneath the heavy blades of corn already in tassel, will read the above with some degree of misgiving. Such men are undivorcibly wedded to their idols. They believe that corn and potatoes ought to be planted in the "dark of the moon;" that the worm of a rail fence should be laid in the "light of moon;" and that the "sign" must be right to perform surgical operations on pigs, calves and colts; otherwise the animals will die. They forget that this is an era of enterprise and progress.

SUBSCRIBER.

PEPPERMINT—ITS CULTURE, ETC.

J. B. L., Hudson, Mich.—Peppermint requires a warm, rich soil; the land is laid off in furrows 15 to 24 inches apart, and sets or parts of old plants, are planted thickly in rows; the plants are kept free from weeds until they cover the ground. The harvest begins early in August and continues until October. The first crop of the field is the best, the second and third being less. The fourth year the field is plowed, and the crop springs up from the broken roots. The yield of the fifth year is about equal to that of the second, and after this the land is diverted to other uses. The first year's crop is the best, not only because the plants are young and vigorous, but the mint is then free from a weed which is apt to spring up later, and which also yields a volatile oil, which is bitter and pungent and deteriorates the product. This is called mare's-tail, fire-weed and by several other names; botanically it is Erechthites hieracifolia, and somewhat resembles lettuce in appearance. The mint is cut with a cradle having two fingers, and raked into cocks, where it remains 12 hours to wilt before it is distilled. The still is a wooden vat of heavy staves hooped together with iron, 4½ feet deep and six feet in diameter. The wilted mint is packed into it by treading it close with the feet until the vat is full, when the lid is fastened down steam-tight. A pipe entering the lower part of the vat conveys steam from the boiler, and another from the top of the vat connects with a worm, as in an ordinary still. The steam being let on, the oil from the mint is volatilized, and its vapor, mixed with steam, is condensed in the worm. The mixed oil and water are collected in a receiver, where they separate by their difference in specific gravity—the lighter oil rising to the top. The oil is packed in cans holding 20 pounds each, and a large share of the product is exported. It is used chiefly for flavoring confectionary, and in the preparation of essences, cordials and the like. "Essence of peppermint," a popular "carminitive" for expelling wind and curing colic and flatulence, is a solution of the oil in alcohol, of a strength proprotionate to the price. "Peppermint water" is prepared like other "waters," by first rubbing up the oil with carbonate of magnesia, slowly adding water and filtering—a fluid dram of the oil to a pint of water. The use of the magnesia is to finely divide the oil and expose a large surface to the water. Peppermint culture in this country was at one time confined exclusively to Massachusetts, Western New York and some counties in Ohio; but later it was taken up by the farmers in Southwestern Michigan, where some years from 2,500 to 3,500 acres are devoted to it. St. Joseph County, Mich., and Wayne County, N. Y. have a reputation for producing the best quality, owing to the greater care they bestow on raising and handling the crop. The price of the product is subject to extreme fluctuations, as the trade in it is liable to fall into the hands of speculators. At one time the whole production of the country was controlled by a single firm, who, to diminish the supply, contracted with growers to discontinue the cultivation for five years. The price is now quite high and very profitable. 2. Some parts of Sir J. B. Lawes's land, at Rothamsted, England, have been kept in a high condition of fertility, yielding heavy crops, for over 40 years, by the exclusive use of commercial fertilizers—nitrogen, phosphoric acid and potash in various combinations—and what can be done in one place can be done in another. Land can, therefore, be kept quite fertile by the exclusive use of such fertilizers. The quantity will depend on the condition of the land, the nature of the crops, etc., so that no particular amount or proportion can be mentioned without a knowledge of these.

THINNING POTATOES.

I HAVE long been in the habit of thinning my potatoes to one stalk in the hill; and a few years ago my 13-year-old boy, who did the thinning, complained that it was hard on his back, and thought it did not pay. At that time we had an acre of Peerless ready for thinning, so I told him to leave one row through the center of the patch without thinning, and we would note the result. We had a fair crop and I ordered my men who dug them to carefully measure the potatoes in the unthinned row, and also in the rows on each side of it. The result was that each of the three rows made about the same amount in

bulk; but at least one-third of the tubers in the unthinned row were too small for market, while of those in the thinned rows almost every one was large and smooth. We should no more expect large tubers from a hill with too many plants, than large ears of corn from a hill in like condition. D. C. A.

Girard, Ill.

Farm Economy.

A HOME-MADE CORN CULTIVATOR.

Although farm implements are now made of all designs by the regular manufacturers, and are sold at such low figures that they are within easy reach of all farmers, still home-made tools will always be popular because they can be made, at a trifling cost, of odds and ends otherwise useless about the farm, and at times when other work is slack or interrupted by bad weather. Moreover, they can be fashioned to suit the fancy or needs of each maker, and there is always a good deal of satisfaction in the use of an implement made by one's-self if it works well. The illustration of such devices is useful not only to farmers in general, but also to manufacturers of agricultural implements, as they are often suggestive of improvements in old devices or even of new combinations or designs.

A sketch of the corn cultivator shown at Fig. 173, was sent us by friend A. P. Freeman, Oakland County, Mich., who says: "It is the best thing of the kind I ever used or saw, as

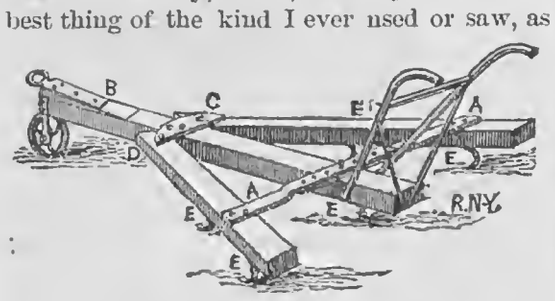

Fig. 173.

there is no jerking on man or horse. It is made of 2x3 inch stuff; the side-pieces are 2½ feet long, and the middle piece is three feet. The five teeth were obtained from an old spring-tooth float harrow, and are put on as shown at E. E. E. E. E., those at the ends of the side pieces being three inches from the ends, the others 14 inches farther along, and that in the middle piece five inches from the end. For the handles I used a pair from a cast-aside Gale plow. The middle piece projects 15 inches ahead of the side-pieces. At A. A., two pieces of half-inch by one-and-three-quarter-inch iron, each 18 inches long, form a cross-bar from one outside piece to the other, and are so arranged as to spread or narrow the cultivator, by inserting a peg through holes bored in them and the middle piece. The bend or crook is three inches from the end. At B., is a wedge-shape piece spiked on the projecting end of the middle piece to make the draft come right. It should be about an inch through at the thickest end and a foot long. At C. is a plate for binding the three pieces together, and a similar one is on the under side. The bolts through these and the side-pieces have nuts at the bottom and are somewhat loose in the holes so as to permit the spreading or narrowing of the cultivator. Heavy band iron will answer for the plates. The forward corners of the side-pieces are rounded a little, as shown at D."

A HANDY POLE-DRIVER.

The ordinary method of driving stakes is, of course, to strike them on the upper end with an ax, mallet, or some other heavy implement; but with hop or bean poles this would be impracticable. With the device shown at Fig. 174, (for a sketch of which we return thanks to friend M. D. Earle, of this city,) they can be driven down very conveniently and quickly. It consists of a piece of tough wood a foot long and four or five inches square at the top, tapering downward wedge-shaped, as in the cut. The part next the pole is hollowed out somewhat so that the pole can rest snugly in it. An ordinary trace chain is wound tightly around the block and pole at a convenient hight in latter, and hooked in place. Then a few heavy blows on the top of the block will drive the pole quickly and firmly into the ground. very blow tightens the grip of the chain on the pole. To prevent the chain from falling to the ground when unfastened from the pole, it should pass through a hole bored in the block. Quite large stakes can be driven down in this way.

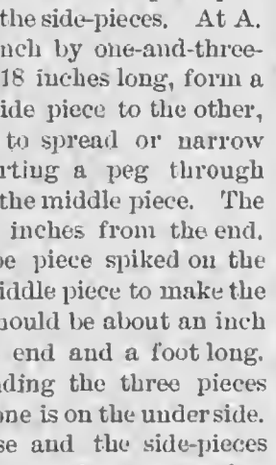

Fig. 174.

A HOME-MADE ROAD SCRAPER.

For the design of the home-made road-scraper, shown at Fig. 172, we are indebted to our friend S. S. Matthews, Chemung County, N. Y. D is a piece of tough, naturally crooked wood, seven feet long and hewed seven inches. B is a four-inch brace, notched at the tongue, C, to which it should be bolted and also bolted to the ends of the beam. D is a wrought-iron or steel bar four inches wide, spiked to the beam, so as to project 1¼ inch below it.

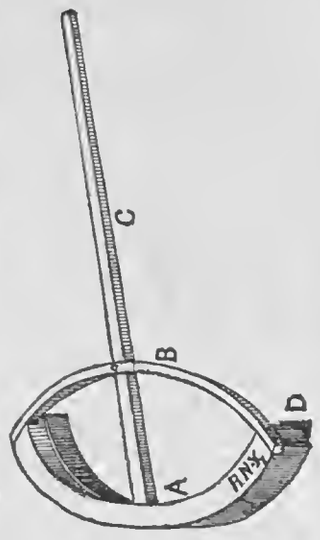

Fig. 172.

A CONVENIENT HOME-MADE HARROW.

The cut of the harrow shown at Fig. 171, was sent us by friend M. Bingenheimer, Osage

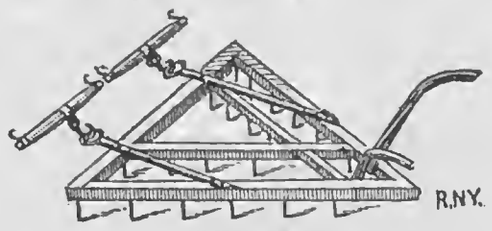

Fig. 171.

County, Kansas. He made his of old rails; but a similar one can, of course, be made of any timber at hand. It was designed for the first cultivation of corn; but was useful for other purposes also. By means of the handles at the small end the implement can be held in the right position. The engraving fully explains the mode of construction.

Entomological.

FIGHTING THE CODLING MOTH.

PROF. A. J. COOK.

Mr. Springer, a subscriber to the Rural from Santa Clara Co., California, requests that I explain my method of fighting the codling moth (Carpocapsa pomonella) with the arsenites, especially in his State, where the pest is becoming a very serious enemy to the apple.

I have found by very careful and pains-taking experiments repeated annually now for several years, that Paris-green and London-purple—white arsenic would serve as well, but owing to the greater liability of its being mistaken for some culinary article, and so becoming a poison to men and not to insects, I never use or recommend it—if mixed with water and put on to our trees in the form of a fine spray, is sure to kill this arch enemy of our most valued fruit. I have found that if a pound of the poison be mixed with 100 gallons of water and kept well mixed, it is still effective to kill the larvæ, as they seek to enter the apple. The watery mixture can be made in a barrel and drawn in a wagon through an orchard, when by use of a force pump and the cyclone nozzle, the poison is quickly, easily and economically applied to the bearing trees. It destroys not only the codling larvæ, but canker-worms, leaf-roller larvæ and various other caterpillars that seem especially to relish the young, tender apple foliage. The expense is very light, and the good results are very great. I find that one application, made two weeks after the blossoms fall, will usually thin out the insects almost to extinction. Some of our critical entomologists have argued that this will kill the first brood only; but if the first brood are all killed, where will the parent moths come from to generate a second brood? The truth is, even our winter fruit is usually almost freed from the destruction of this insect by the use of this remedy. Mr. Springer says there are three broods in California, which would make this remedy still more valuable there.

In applying the poison, I have always worked the force pump by hand, finding the Whitman Fountain Pump very excellent for treating a few trees, and one of the large force pumps made fast to the wagon, the best thing for a large orchard. In Western New York they improve my method by an attachment to the wagon wheel, which does the pumping.

Mr. Springer asks if in his State, where there is no rain, there would not be danger in such use of the arsenites.

If he has read my reports he will see that the wind soon scatters the poison. I found that young cabbages under shelter, or even in a closed room, soon lost the fine powder which was applied to the plants, as shown by analysis and by close examination with a high-power microscope. I have no doubt that apples, treated just after blossoming, would be free of all traces of the poison long before harvest. Having lived in California three years, I know well that though in the fruiting season of the apple there may be not a drop of rain, there are always refreshing breezes, which are often far more than gentle. Yet, in such an important matter I advise great caution. Let Mr. S. use the arsenites, and then get some good microscopist to make a careful examination a month after the poison is applied, and see if a grain of it is to be found on the fruit. Such a test is crucial, and I have not a shadow of doubt but that it will show that the poison has done its work and fled. This disappearance is not so surprising. If wall paper may part with the incorporated Paris-green, which furnishes the rich, beautiful green tints, so as to poison people, why should not the loose powder be swept from the apple?

What Others Say.

Sewage as Manure.—We learn from the *Journal d'Agriculture* that a German chemist has succeeded in extracting organic matter in solution from sewage by means of chemical precipitation, in such a way that it is obtained in a solid form for the purpose of being utilized as a manure with the rest of the residuum. The discovery has been successfully applied to the sewage of houses in Berlin. The sewage is allowed to pass through a tank in which, by means of cheap chemical ingredients, the manurial matter is separated from the water, leaving the latter to flow off clear, while the former is forced into an apparatus where it is converted into a dry powder. As the demand for fertilizers increases, fresh sources of them are being constantly discovered. The original discoveries of Liebig, Ville and Lawes and Gilbert with regard to ordinary commercial fertilizers, have of late been supplemented by the discoveries of German potash salts at Stassfurt, of phosphatic rock in South Carolina and of apatite in Canada; and should this new mode of utilizing sewage prove cheap and efficient, what a vast supply of fertility will be available in every inhabited part of the world.

Corn Culture.—B. P. Ware, speaking on corn culture before the Massachusetts Agriculture Society, said if the Pilgrim Fathers had not been fortunate enough to discover this golden grain the first Winter after they landed on our shores, the condition of this country at the present time would be doubtful. Corn can give us more grain per acre than any other cereal, and more fodder than any of the other grasses, and its influence on the prosperity and wealth of the United States is greater than that of any other cultivated plant. We have thousands of acres of plain, light land, producing less than a half ton of hay per acre annually, that could be profitably devoted to corn without interfering with the other operations of the farm. But we must adopt the newer methods of culture, and use the improved labor saving implements adapted to large fields. The speaker recommended plowing in the Fall, but he would cultivate thoroughly just before planting, to destroy weeds and fine the soil: 1000 pounds of suitable fertilizer applied annually will produce good crops of 50 bushels per acre, and two tons of fodder. He prefers to plant in drills 3½ feet apart with horse corn planter, dropping the kernels about five or six inches apart in the drills, or thick enough to allow an average of one stalk to each square foot on the whole surface. Before the corn comes up he drags the field with a smoothing drag of plank, having a two-inch strip of inch-board nailed underneath for a pulverizer. After the corn comes up he uses the Thomas harrow three times, at intervals of a few days, to kill the weeds, after which the cultivator or horse hoe, run two or three times between the rows, will do all the work of cultivation and leave nothing for the hand hoe.

RURAL'S LIFE NOTES.

The Gardener's Monthly expresses the opinion that the Berckmans Grape will have "a wild run, after another year, in the North." It is, the G. M. says, as hardy and as free-growing as the Clinton, one of its parents, while the quality is very little below the Delaware. Mr. Meehan regards it as one of the best of all of the late Dr. Wilie's hybrids.....

At every cattle convention held in the West this year the question of providing shelter for cattle has been brought up. There has never been but one decision in the matter. All are agreed that it pays to shelter stock, and yet a large proportion of cattle are shivering in the cold. Unfortunately, the owners of such cattle are not the men who attend conventions and intelligently discuss the question.....

Mr. C. S. Plumb, Assistant Director of the New York Experiment Station, says, in Country Home, that the Bessarabia Corn, largely advertised several years ago, is the same as the Common Maryland White. Several different kinds, however, are sold for Bessarabia. He also states that Blount's Prolific is the old Prolific of Tennessee. This surprises us. About the time that we distributed this corn among our subscribers, we wrote to Mr. Blunt (as he was then called) as to its origin. The reply was, "It is the result of science and cultivation," or words to that effect.....

Mr. Plumb finds White Novelty and White Zealand the same as White Russian Oats.....

He also finds Golden Drop, California Blue Stem, Lancaster, Red Amber, Scott and Tasmanian Wheats the same. Also Fultz, Finley and Heighe's Prolific. He also finds Silver Chaff and Treadwell the same—a surprise to us, though we do not remember ever to have raised the Treadwell as Treadwell.....

In allowing water to stand in the stable over-night during the Winter, Mr. C. S. Plumb has found that simply covering the pails with bagging or cloth of any kind, will prevent freezing in the coldest weather. He has kept water from freezing by this method, when if the water were exposed, it would freeze hard over the top, as well as at the sides of the pail. This he mentions in Our Country Home.....

Mr. Plumb advises every farmer to have vaseline on hand. He knows of nothing more healing and antiseptic for wounds, sores and inflammations.....

The Editor of the Phil. Weekly Press holds that Timothy should be added to either Blue Grass or Red-top—not that Timothy is good in itself as a lawn, or that a good lawn can be made of it alone, but because it gives an immediate effect.....

The N. Y. Tribune gives good advice when it says: "Cut down the garden to the smallest space consistent with the needs of the family. Then take *good care of it.*".....

An acre of onions, says Joseph Harris, in the Weekly Press, will afford hoeing and weeding enough to keep the boys and girls out of mischief—and money enough to lessen the cares and anxieties of the mother and father. Onions want rich land, but 750 pounds of nitrate of soda per acre, and 400 pounds of superphosphate will make any of our ordinary land richer, for the first crop of onions, than 75 tons of barn-yard manure. This is true, no doubt, as far as it goes. But how about the potash?.....

The best vine to cover an old stump or a low trellis is the Honeysuckle—preferably Hall's.....

Everywhere.

RURAL SPECIAL REPORTS.

Alabama.

Grand Bay, Mobile Co., April 3.—On March 15 we had a slight frost, and on the 27, 28 and 30 cold rains. Last three days sunny, but such vegetables as are up look very much as if Winter had the upper hand. Beans look sick; cucumbers killed; second plantings just coming up; a large proportion of the tomatoes set in field have vanished; corn three to four inches high, but not thrifty. I made first shipment of strawberries yesterday; last year I sent off the first lot April 7th and the year before on March 28th. Potatoes planted on Rural plan up and looking well. I was very much interested in reading the Rural's last Special on potatoes. Potatoes are raised very extensively in this country for spring shipment west and north. The great drawback, however, is the excessive railroad freight charges, so that unless they sell for rather high prices, a very small margin of profit is left for the farmer, and the same rule holds good for all sorts of vegetables grown here for distant markets, so that many growers have nearly or quite quit the business, or have turned their attention to such productions as will put a larger value in smaller bulk, like dairying and small fruits.

C. C. W.

Canada.

Belmont, N. S.—Times very dull. A warm Winter with very little snow. Farmers had hark work to get fire-wood and fencing. Potatoes, 90 cents per barrel; flour, $4.50 to $5.50; beef, $6 to $10; pork, $6.50; hay, $12 per ton; oats, 45 cents per bushel. L. DEA.

Illinois.

Pleasant Valley, Jo Daviess Co., April 8.—Although last season was very wet here,

still as the country is quite rough, our crops were not drowned out as they were in the flat, low parts of Ia. and Ill. But lots of low-lying meadows were overflowed by two of the biggest floods ever known here, ruining hay and making it high-priced now. Cattle looking well; but times have been hard on calves, as scours appear to be epizootic around here. Potatoes rotted badly last season; worth now 75 cents to $1. Acreage of both winter and spring wheat uncommonly light. Tobacco raisers rather discouraged by low prices—six to seven cents per pound. W. S.

Kansas.

PARSONS, Labette Co., April 5.—The world has heard from Parsons in the last few days, and nothing to its credit. The State Guards—eight companies—arrived here simultaneously on two branches of the Gulf Road, and are now quartered in the machine shops of the M. P. R. R. A year ago when the railroad company thought of making a second reduction of wages, farmers, merchants and professional men were in unison against the measure as there seemed no justice in it. To-day they are so much against the strikers that the writer has not heard a single justification of the strike, except from the strikers. On Saturday the first freight train, in just a month, moved southward and was followed by numerous trains during the day and night. The tracks in the city were lined on both sides by the Guards, and each moving engine had four to six Guards sitting on the caboose. The day was sleety and windy, and all the Knights one could see were waiting their turn to get at the paymaster. The company owed them for February, and also for five days in March. At noon 209 had been paid, but the company out of this number paid 95 in full, and "let them out," the remainder were paid as usual, for February, with the option of returning to work. Thus the company will rid itself of the leaders, and will probably resume operations in the shops ere long. The merchants hailed the arrival of the pay car, but on Saturday evening they were very blue. The payments made them for current supplies by the operatives were not more than one-tenth the usual amount. It was noticed, too, that the checks given by the company were being cashed by the banks, indicating, as the merchants say, a disposition to evade them. The outlook now is that the leaders will slide and that the military will be quartered upon us till complete order shall again take possession of our beautiful town. All the company has to fear are the guerilla attacks that may be made upon their tracks and bridges. Farmers have been interrupted by not being able to get seeds, but the weather has been too raw for the past two weeks to make much progress in planting. Three-fourths of the plowing is done. Oats are sown and some corn is planted. The web-worm's ravages resulted so badly last year on the corn crop that we had to bring corn on from the central portion of the State. S. B.

Ohio.

BLOOMVILLE, Seneca Co., April 7.—Wheat looks well on bottom lands; but on the clay uplands it is badly killed. Feed plentiful and stock of all kinds in good condition. Success to the RURAL! G. M. M.

Wisconsin.

LA FARGE, Vernon Co.—From the small Blush Potato I got three years ago, I have now enough for a full crop. Where other sorts rot, the Blush escapes injury. We cannot ask for a better variety, and I shall make it my standard crop. The mixed corn was cut in June by a hail-storm, which left only enough for trial next year. Flageolet Bean yielded well and ripened first of all I had. Last Fall I sowed two acres of Fultzo-Clawson Wheat—the best of all I have tested. The Garden Treasures were highly prized by the "fair" part of the family. J. W. S.

GRUB-IN-THE-HEAD IN SHEEP.

G. W. H., Rochester, Mass.—1. What are the symptoms of grub-in-the-head in sheep? 2. What is the remedy? 3. At what season is the trouble greatest? 4. Is there any preventive?

ANSWERED BY F. L. KILBORNE, B. V. S.

1. Grub-in-the-head of sheep is due to the presence, in the nasal sinuses, of the larval form of a small bot or gad-fly—Œstrus ovis. The fly, which is rarely seen, is considerably smaller than the well known horse bot-fly—Œstrus equi—is of an ashen or grayish color, with the abdomen more or less marbled with yellow and white. There are no very marked symptoms except when there are quite a number of the grubs or larvæ present. They then cause much irritation with redness of the nasal mucous membrane, more or less white muco-purulent discharges from the nose, a falling away in flesh, dullness, giddiness or staggers, and rolling of the eyes. The larvæ are rarely present in sufficient numbers to cause death; but the loss in flesh and wool is often very considerable. 2. By trephining the bones of the face, on each side between the front of the eye and the median line of the face, so as to enter the sinus of each side (the head of a dead sheep can be easily examined to determine the exact locality for the trephining), the larvæ may be washed out with a gentle stream of tepid water, and the opening allowed to heal, like an ordinary wound. During the later part of Winter or early Spring the larvæ may sometimes be removed without a surgical operation, by confining the sheep in a warm building to entice the larvæ into the nose, and then introducing snuff or solutions of salt or tobacco into the nose to kill the larvæ or cause their expulsion by sneezing. 3. During the Winter and Spring. The embryos that are to become the larvæ are deposited by the bot-fly about the margin of the nostrils of the sheep in late Summer. The embryos then crawl up into the sinuses where they attach themselves, and remain during the following Winter and Spring until the larval development is completed. In early Summer the now fully developed larvæ make their way out through the nose, drop to the ground and crawl into the soil where they pass into the pupa state, and in a few weeks emerge as perfect flies to torment the sheep while depositing the embryos of that season. 4. An excellent method for preventing the attacks of the flies is to feed the sheep salt from two to three-inch augur holes in logs or timbers, the borders of the holes being kept smeared with tar so that the noses of the sheep get a dressing of tar whenever they eat the salt. Another method is to turn a deep-furrow across the sheep pasture in various directions, in which the sheep may stand with their noses at the bottom of the furrow when attacked. By watching the sheep during late Summer and Autumn, they may be seen running wildly about, trying to bury their nostrils in the dust, or collecting in groups with their heads to the ground to avoid the attack of the flies. Then is the time to take measures to aid the sheep in preventing the attack and deposition of the embryos by the flies.

ROOTS WITH OTHER FEED FOR MILCH COWS.

C. & L. G., Waynesboro, Pa.—From each of 15 cows we are making an average of 4½ pounds of butter per week. Their feed daily is 6½ quarts of half wheat bran and half corn chop. Timothy, clover hay and corn fodder are fed dry all they will eat without any waste. Average price of butter 25 cents per pound. We have favorable conditions, viz., strong bottom soil (alluvial), and can irrigate at pleasure for growing beets. In preparing for next Winter, will it pay us to grow beets or mangels to provide additional daily rations? Why will it pay?

ANSWERED BY HENRY STEWART.

The results derived from the use of mixed foods are relative and reflex; that is, one acts upon another and so produces better effects than either alone. The use of beets or mangels in the Winter, with hay and mixed corn meal and bran, increases the effect of the latter upon the milk product, and thus every dairyman should test mixtures of food to learn by experience the gain that may be made. No precise law can be laid down, because animals differ very considerably; but it is a fact that mangels or sugar beets, or even apples in the season, fed with the meal, increase the product of butter by adding to the quantity of the milk. This is the most important thing to know, as a food that is apparently deficient in fat, and supposed to have no direct influence upon the product of butter, may yet, by increasing the flow of milk, actually stimulate the secretion of fat and so produce more butter than the food given with it would have done without it. This is one of the surprising reflex results of mixed foods, which are ascertained only by direct experiments, and cannot be predicated by a mere knowledge of chemical analyses of food substances. A great number of experiments made for some years past have, however, made this very clear, and hence the use of mangels or sugar beets have been found exceedingly valuable and profitable. One peck per day, fed at noon, cut fine and mixed with two quarts of mixed feed, as

100 New Scrap Pictures and Agents' Samples for 1886, **5 cents.** S. M. FOOTE, Northford, Conn.

(*Continued from page* 269.)

finely ground corn meal and coarse middlings, is a proper ration, and in the apple season the same quantity of ripe apples (no other kind will do) is equally useful. It will undoubtedly pay. Another fact might be noted in this connection, which is pertinent, viz., that the cutting of hay or fodder, wetting it and mixing the meal with it, has always been found to add to the product of milk and butter both; the reason in both cases being that the prepared or mixed food is better eaten, and being more palatable, is more thoroughly salivated and is consequently better digested: the salivary fluid having quite active solvent and digestive properties.

MANURING "NEW LAND."

J. B., Pilot, Neb.—Beyond the fact that you live in a "new country," where manure is not used by farmers who think their land rich enough without it, we know nothing about your farm, its soil, location or the crops you wish to raise. It is certain, however, that every crop removed from the farm carries with it more or less of the fertility of the land. Some, of course, remove more than others of all kinds of plant food, and some more than others of particular kinds, some being specially exhaustive of potash, others of phosphoric acid, etc. The cultivation given will also have considerable effect in the same direction. It is only a question of time, crops and culture, therefore, when some one or all of the three great essential elements of plant growth—nitrogen, phosphoric acid and potash—will be exhausted or reduced in quantity so as to be insufficient for profitable crop production. It may be five or it may be 50 years before this condition is reached, but reached it will be, unless an equivalent for the fertility removed shall be returned to the soil. If this is partly done from the outset, the date of exhaustion will be proportionately deferred; if it is wholly done, it will never arrive. It is more than doubtful whether "virgin soil" is naturally so rich already, that artificial enrichment would not increase crops grown on it. Applying manure to such land therefore, is sure to defer or prevent the era of infertility, and pretty sure to increase the production from the outset. It would be well to get the manure on the land as soon as possible, however, and at the lowest expense. Whether the outlay for the extra labor will be repaid, will depend on the cost of labor and other local conditions; not knowing these, we can state only general principles. Some object that it is not economical to feed a man before he is hungry, or the soil before it needs plant-food; but abundant food one day will not prevent a man from being hungry next day, but will prevent the soil from being hungry next year. It is seldom foolish for a man starting in farming, or for a farmer just starting in a new section to follow the customs of the most successful of his neighbors.

SOILING CROPS.

W. S., Beanseitle, Can.—What crops should I sow for half soiling milch cows next Summer? Soil a clay loam with some gravel, most of it plowed the first time last Fall. I also plowed some alluvial land on which the washings from the hills have settled for a foot or more—soil very rich-looking. What should I sow on each. In a late RURAL Prof. Edwards says immature corn-stalks are very objectionable for milch cows whether fed green, cured or as silage; is he correct?

ANS.—Evidently our friend has neither a field of winter rye nor of clover, as the regular dairy farmer should have. This being the case, we see no possible way to tide him over to the time when he can utilize a soiling crop, except by feeding a little hay, well-moistened, and mixed with a liberal feed of bran and oatmeal, till the first available soiling crop can be grown. This would be oats or millet, or both. On a farm in the condition he describes, fodder corn would be his next available soiling crop; and as to the time of feeding it, Prof. Edwards is good authority, as it is probable that the feeding of immature corn-stalks either from the field, or after having been siloed, has thrown more discredit on soiling and the use of silage, than all other causes combined. The suggestion that bran and oatmeal be liberally used to piece out short, or even very short pastures, need appall no one who is in the dairy business; for it is one among the latter-day truths that there is a manurial as well as a feeding value in them, that is equal, or very nearly so, to their cost. The investment is returned at once, through the milk and butter; and later on, the farm has the manurial deposit to draw from. Given the cows, and the limited pasture our correspondent speaks of, he need have no hesitation in thus feeding his cows till he has his farm in correct rotation; that is, in corn, either field or ensilage, winter-rye, oats or barley, and clover. We judge the land he describes is all right for almost any crop his cows would consume, that he can put upon it, but it is probable that it would be well to sow oats on his alluvial soil, and get it seeded well to clover for his principal soiling crop for 1887, till his corn of that year is ready.

GRUBS ON THE BACKS OF CATTLE.

S. J. D., Olean, N. Y.—"Grubs on the backs of cattle" are the larvæ of the cattle gad-fly which lays its eggs on the backs of cattle about August when the flies abound. They abound also less numerously during all the summer months, as is indicated by the sight of cattle galloping furiously about the pasture with up-lifted tails, evidently in great fear and excitement. The fly pierces the skin and deposits its egg in the orifice. Soon a small swelling appears which grows larger as time passes. The tumors, sometimes the size of a walnut, have small openings through which pus is discharged immediately before the larvæ are ready for dismissal. The grubs usually escape from the tumors in June and fall to the ground into which they enter to undergo their proper changes. Where not very numerous they do not call for special treatment, as they do no permanent injury, though they worry the affected animals. They can be readily dislodged by pressure of the fingers and a pair of tweezers, and on falling to the ground, should be killed. They are generally called "warbles," "wormils," "wormils," or "wourmils" in England where country people in different sections use a multitude of dialects so different from each other and from the language of educated people that it is often no easy matter for an "outsider" to even guess correctly the drift of what they are saying.

FERTILIZERS, ETC.

M. H., Askport, N. Y.—1. Yes, sulphate of copper is bluestone or blue vitriol. 2. Copperas is sulphate of iron or green vitriol. Formerly it was synonymous with vitriol and included green, blue and white vitriols, or the sulphates of iron, copper and zinc. 2. Kainit is the crude sulphate of potash from the Stassfurt mines in Germany. It contains about 12.5 per cent. of actual potash, equivalent to 22¼ to 23¼ per cent. of sulphate. Besides this, it contains 50 per cent. of chloride of sodium or common salt. On some soils it produces good effects on crops: but unless it can be placed on the farm cheap, it is better to substitute sulphate or muriate of potash. 3. Muriate of potash is somewhat like common salt, and is a combination of potash with muriatic acid. It also comes from the Stassfurt mines where it is so mixed with soda, magnesia, sulphur, etc., that in preparing it for use as a fertilizer 6¼ tons of raw material are required to make one ton of muriate containing 80 per cent. of pure muriate of potash, or 50 to 54 per cent. of actual potash. 4. "Where ashes cannot be had," muriate of potash is probably the cheapest form in which potash can be obtained. 5. We cannot see what manurial effect either lime or salt would have upon potatoes, beyond, perhaps, rendering more available some of the fertility already in the soil.

CHRONIC COUGH IN CALVES.

P., Cornwall, Vt.—My calves have every day had a husky cough for several weeks, with a swelling or bunch under the chops, a dry, warty appearance of the skin in places, especially at the joints. The skin inside the knee has cracked and bled a little in one or two places; what's the matter?

ANSWERED BY F. L. KILBORNE, B. V. S.

We suspect the calves have a chronic cough and perhaps sore throat, due to exposure during the Winter. Take one part of solid extract of belladonna and four parts of pulverized saltpeter, mix with sirup or honey, to form a thick paste. For yearlings a lump as large as a butternut three or four times daily, to be placed upon the back teeth and slowly swallowed as dissolved. Steam the nostrils every evening by feeding a hot bran mash, made by pouring boiling water on to two or three quarts of wheat bran, and let the animal eat it from a bucket while cooling. If the cough and swelling do not improve in a week or two, apply a mild blister, of strong ammonia one part, and sweet oil two parts, over the region of the throat. Any costiveness should be relieved by one-half-pint doses of castor oil.

ABOUT PLUMS.

T. O. D., Spencerville, Md.—1. The best plums for your section are the improved native varieties, such as Wildgoose, Newman, Quaker, De Soto, Forest Garden, Moreman, Golden Beauty, Wayland, etc. By planting several kinds of this class in close proximity to each other, an annual, profitable crop is as certain as, if not more so than, with any other of the tree fruits. Most of the native varieties are proterandrous—that is, the stamens are precocious in the performance of their natural duties, and shed the pollen too soon for fertilization. This defect is remedied by having different varieties planted together. 2. No. Plum is not as good as peach stock. The latter is emphatically the best on which to propagate any of the native varieties, and for any of the European kinds that will succeed on it, that are intended for planting in your section. Some of the European class, however, do not unite solidly with the peach, such as Jefferson, Washington, Lombard, etc; but Richland, Coe's Golden Drop, Pond's Seedling and many others succeed as well on peach as on any other stock; but for profit none of this class is worth consideration.

CUT IN MARE'S KNEE.

H. S. C., Gaines, Pa.—1. My mare slipped on the ice and cut a three-inch gash on her fore-leg just below the knee-cap; simple remedies do not make it heal; what will?

ANS.—The edges of the wound should have been brought accurately together and stitched with white silk, then with perfect rest of the limb "simple remedies" should have effected a cure in a few days. It is necessary that the animal should be kept quiet to prevent movement of the lips of the wound by the action of the knee-joint. This movement may prevent healing indefinitely. It may even be necessary to apply a splint to the limb for a few days to keep the knee-joint immovable. The wound should be kept clean with tepid castile soap-suds and dressed with carbolated vaseline or other simple ointment. If the wound has become unhealthy, carefully wash it out with a weak solution of zinc chloride, one-half dram in a quart of water.

EPILEPSY IN A HORSE.

J. A. S., Denver, Col.— My 10-year-old horse eats, works and looks well, but never lies down in the stable. When standing his lips and head twitch nervously, and he has fits—usually in the stable. He falls down and is liable to go right through the side of the building, usually cutting himself badly. Although bled freely, he recently had a bad fit while in harness; what ails him?

ANS.—The animal evidently has epileptic fits, due to some unknown source of irritation to the nerve centers. It would be necessary to have the animal under our immediate care for a length of time to ascertain, if possible, the cause of the irritation before we could tell what to do for him. In many cases very little or nothing can be done, beyond avoiding excitement, and attending to the general health of the animal. The diet should be laxative and easily digestible, and the bowels should be kept freely open with purgatives if necessary.

SOME CROPS FOR SOILING.

N. P. G., West Newton, Mass.—1. Oats for soiling should have strong, rich land, well prepared by careful plowing. Four bushels of the heaviest and soundest seed to be had will be none too much. Sow on the furrow before harrowing, and if peas are to be grown with the oats, sow two bushels after the oats are sown, and before harrowing. The crop should be got in as soon as possible. It is in the best condition for feeding when oats are in the milk. The common Canada pea is the best for this use. 2. If the land can be cleared and got ready early in July, a crop of Hungarian can be grown after the oats and peas. Fodder corn (some early sweet) will make a good growth if there are no frosts in September and the season is otherwise favorable. For the best results with these second crops, sow 400 pounds per acre of a good complete fertilizer with the seed.

KEEPING ANTS OUT OF BEE-HIVES.

E. M. C., Pittsburg, Kans.—Usually ants cluster about hives in Spring for warmth, seldom doing any harm. They may be brushed away or poisoned with Paris-green or alcohol applied to the places they frequent. If the poison is sweetened to attract the ants, then to prevent the possibility that the bees might eat some of it, it would be best to put the sweet poisonous mixture in a box with a hole large enough for the ants, but two small for the bees. Or the ants' nests can be hunted up, and pierced with a crowbar. Then if an ounce of bisulphide of carbon is put in the hole and this is quickly plugged up, the liquid will kill all the ants, Of course, this should be done when all the ants are in the nests.

INDIGESTION IN CALVES.

R. K. P., West Hartford, Mo.—What caused the death of several calves in fine condition? They were well sheltered and watered and had all the shelled corn they would eat with good Timothy hay. First they lost appetite, refused to drink, became constipated and tender about the kidneys: yet they moved about freely, didn't throw up their food, had no fever, and lived for nine days after they were attacked. A post-mortem showed food undigested and the stomach full of water.

ANS.—The calves were probably killed by eating too much corn. The remedy is very simple. Feed less corn, which should be supplemented in part by wheat bran, middlings, or oil meal. For those that are costive, give one-fourth pint of castor oil.

FEED FOR BUTTER.

G. W. S., Parishville, N. Y.—1. An excellent feed for cows for a butter dairy is made by mixing 300 pounds of fine corn meal, 200 pounds of fine bran or coarse middlings, and 100 pounds of cotton-seed meal or new-process linseed meal. Of this, eight pounds a day may be given mornings and nights in a feed of five pounds of hay cut fine, wetted and mixed with three pounds of the meal, and two pounds of the meal given dry at noon with five pounds of long hay. A feed of a peck of mangels, cut fine and mixed with the noon meal, is very useful.

Miscellaneous.

M. H. K., Salisbury, Vt.—1. What is the percentage of potash and soda in corn-cob ashes? 2. Is the Japan Chestnut hardy enough for Central Vermont? 3. Will the Pocklington and Empire State Grapes ripen here? 4. From the seed-ball which produced a single stalk, I raised, last season, 26 potatoes that weighed 3½ pounds, the three largest weighing a pound; was this an extra-large yield?

ANS.—1. Air-dry cobs give five per cent. of ash, of which 2.4 per cent. is phosphate and and 1.10 of one per cent. soda. 2. We don't know, but are a little inclined to doubt it. 3. The Empire State may—doubtful as to the Pocklington. 4. If the plants were one foot apart in drills and the drills three feet apart, this would give 14,520 plants to the acre. Your yield would, therefore, be 50,820 pounds, which, at 60 pounds to the bushel, would make 847 bushels to the acre.

L. W., Ametia, Ohio.—1. Tomatoes are inclined to root here on heavy oak soil, when stable manure is used in the hill; when it is scarce what fertilizer should be used instead of or with it for tomatoes? 2. What's the best fertilizer for corn and strawberries on the same soil?

ANS.—1. Unless the soil is very poor we do not approve of using much manure for tomatoes. It induces much vine and little fruit. Hen manure is good; ashes and bone are excellent. 2. Not knowing the needs of your soil, we can only recommend a complete fertilizer or, in other words, one that contains potash, phosphate and nitrogen—blood, ashes or sulphate of potash and bone. Send for the circulars of trusty fertilizer manufacturers.

W. R. M., Hume, N. Y.—For several months the eyes of a valuable mare have been sometimes swollen and weak, and then they have discharged water freely. At intervals of several days they are in excellent condition; but soon the trouble sets in again. What should be done?

ANS.—The animal is evidently suffering from repeated attacks of periodic ophthalmia. For treatment of the disease see the F.C. for March 27. If the animal is very valuable, we suggest you consult a competent veterinarian, since a cure may be possible.

J. C. S., Bath, N. Y.—A callus has formed where "scratches" healed on the back of the ankle below the fetlock of a young horse; the ankle is somewhat enlarged and the callus sometimes cracks; how should it be treated?

ANS.—Whenever it cracks keep the parts clean and apply a tar dressing daily. The application of tincture of iodine every four or five days for a few weeks to the swelling and callus may partially or entirely remove them. This failing, the callus can best be removed with the knife, if at all.

W. N. J., Montrose, Cal.—My hogs stagger as they walk, sometimes falling over behind while keeping on their fore legs. They fall off very fast, and all have sore, running eyes. Some of them have also bad fits; what is the trouble?

ANS.—Probably swine plague or hog cholera. Read the article on this subject in the F. C. of Jan. 23.

M. E. P. W., Jersey, Ohio.—Judging from the specimens at the Rural Grounds, the Russian Mulberry strikes us favorably as a summer wind-break. How well it will bear cutting back to adapt it as a hedge plant, we can not say. It certainly will not turn animals of any kind.

G. H. C., Gravelly Valley, Cal.—We know of no way of preventing gophers and moles from injuring the roots of plants except by trapping or poisoning.

P. S. R., Flatbrookville, N. J.—Consult a competent veterinary surgeon. Such cases cannot be satisfactorily treated through brief correspondence.

J. R., Lovingston, Vt.—Nothing but cultivation will eradicate garlic or wild onions?

Emil Anderson.—We doubt it.

DISCUSSION.

"WARBLES" IN CATTLE.

E. B. C., PARMA, Mich.—Whenever warbles have been removed from the backs of cattle, I have never known the same animals or even

their calves to be again molested, even when running with hundreds of "warbly" cattle. I used to remove the pests by squeezing them up about one-sixteenth of an inch with one hand, and pulling them out (tweezer fashion) with the thumb and finger nail of the other, when a little more than half grown. The puzzle to me is how do they propagate.

R. N.-Y.—As warbles are the larvæ, or grubs, of the cattle gad-fly, and this pest is quite "numerous" each Summer, we really cannot see how animals that have been attacked once can possess immunity from attacks thereafter, and still less how their calves can be equally fortunate. Even if the flies that had found a resting place as larvæ in the back of any particular animal were mindful and considerate enough not to plague it or its offspring, for the sake of "auld lang syne," others would have no such reason for grateful recollection. An attack of small-pox, whooping cough, scarlatina, or measles, it is true, renders the subject "proof" against all subsequent infection, probably by effecting such changes in some sensitive part or property of the human system as either to remove it altogether or render it callous or unsusceptible to future forms of infection, in the shape of either spores, bacilli or other scientific terrors; but this is the case only in infectious and contagious diseases, and "warbles" have not hitherto been placed in this category. As to their mode of propagation, see "Grubs in the Backs of Cattle," elsewhere in this department.

YELLOWS IN THE PEACH.

ELI MINCH, SHILOH, N. J.—A late RURAL quotes me as saying that I do "not believe that seeds from trees having the yellows will produce unhealthy trees," and that from such seeds I agree to grow fine healthy seedlings; also that I deem the man who contends that the "yellows" is a contagious disease, a dangerous character. The quotation is correct. I will do what I agree to do as therein stated. There is no trouble if the soil and climate are favorable—that is, if the latter is not too severe, and the former not too wet for growing healthy peach seedlings from seeds of trees affected with the yellows. The use of sufficient potash and bone will grow healthy trees in all cases, as I know from a thorough trial in growing the peach. So much is said about the contagious nature of the yellows, without any foundation, and so many are scared thereby so that they are deterred from growing peaches, and thus rob themselves of one of the most delicious fruits, that I must contend that those who maintain the contagiousness of the yellows are not only mistaken, but dangerous by their teachings. After a vast deal of trouble with the yellows, practical experience has taught me that by the use of proper fertilizers there is no trouble in growing peaches from the seeds of diseased trees, and I guarantee to grow healthy trees from seeds from the fruit of trees affected with the yellows.

T. T. L., SOUTH HAVEN, Mich.—On page 220, Mr. Minch is made to say, "he does not believe that peach seeds, from trees having the yellows, will produce unhealthy trees;" and that "he deems the man who contends that it is a contagious disease a dangerous character." I will not pretend to know what Mr. Minch calls "yellows;" but, as it is known among Michigan orchardists, the man who, in the face of our experiences with it, would question its contagious character, would be considered proof against the evidence of facts. My observation has shown that seeds of peach trees badly diseased with yellows, rarely, if ever, contain germs; and of course will not grow. A few years since, I saved a bushel or more of seed from what appeared to be a healthy tree. The seed was planted the following Spring, and made but feeble growth, with abundant indications of yellows; and during the same season the parent tree produced a crop of fruit unmistakably diseased. This satisfied me that the disease had been latent in the tree the previous season, and had imparted the contagion to the seed of the previous year, but failed of outward manifestation till the following year.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING April 17, 1886.

Implements and Machinery.

THE ASPINWALL POTATO PLANTER.

It Marks! It Furrows! It Drops! It Covers! It Distributes Fertilizer!

CORN PLANTER ATTACHMENT FOR 1886.
Send for Circular to

ASPINWALL M'F'G CO.,
THREE RIVERS, MICH.

MYER'S FORCE PUMP.

The only double acting Force Pumps with Expansive Plunger Bucket and GLASS VALVE SEAT. The only Successful Drill Well Pump. Simple, durable, powerful, easy to operate. Never affected by frost.

MYER'S DOUBLE LOCK REVERSIBLE HAY CARRIER

A perfect reversible carrier. New Myer's iron and wood track carriers the simplest carriers made. Double and single harpoon hay forks, pulleys, grapplers, etc. Illustrated catalogue free. F. E. Myers & Bro., Ashland, Ohio.

The best made.

DEERE Seed Drill and Fertilizer Distributor.

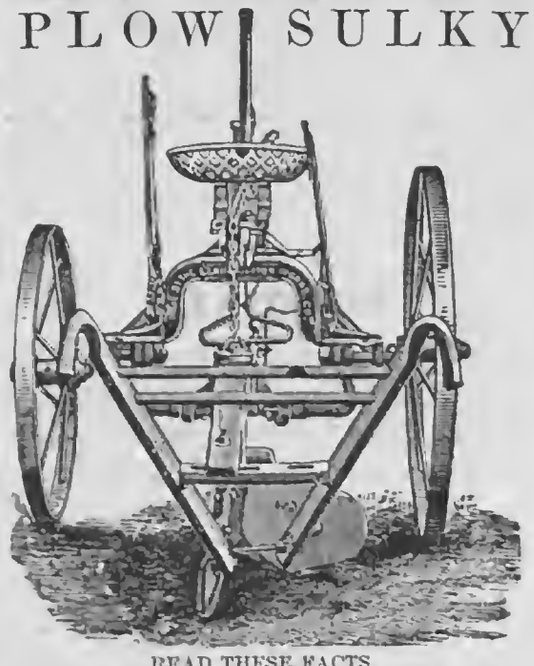
NEW AND VALUABLE.

A SUCCESSFUL FERTILIZER DISTRIBUTOR.

Fills a long-felt want. Drops Corn, Beans, Peas, and all similar seeds, and distributes all kinds of Fertilizer in quantities to suit.

Send for descriptive circular to J. B. BARE, General Agent, 41 South Bay Street, Baltimore, Md.; or DEERE & MANSUR CO., MANUFACTURERS, Mention this paper. MOLINE, ILL.

THE ELKHART PLOW SULKY

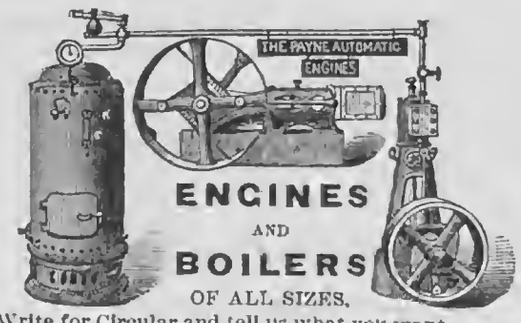


READ THESE FACTS.

Lighter Draft with Driver Riding than ordinary Plow with Driver Walking. Turns square corner without backing. It is wholly constructed of Iron except tongue and front lever.

We claim and GUARANTEE that a Plow attached to the Sulky and carrying the driver, is from five to 100 pounds lighter draft than the same Plow doing same work without the Sulky. Write for prices.

ELKHART IRON WORKS,
ELKHART, IND.
Mention Rural New-Yorker.



ENGINES AND BOILERS OF ALL SIZES.

Write for Circular and tell us what you want.
B. W. PAYNE & SON, Drawer 1005, ELMIRA, N. Y. or address our New York Office.
Eastern Agents, HILL, CLARKE & CO., Boston, Mass.
Our Patented Vertical Boiler will not prime. No danger of burning flues.

The Runabout Wagon.

Patented January 15, 1884.

Twelve different styles. *Light, Strong, Convenient* and *Low-priced*. The popularity of the RUNABOUT is such that its sale exceeds that of all other vehicles of its class combined.

Send for Illustrated Catalogue and price list direct to the manufacturer, ORVILLE H. SHORT, Syracuse, N. Y.

THE NATIONAL STEELED METAL PLOW.

GUARANTEED to be made of first-class material, nicely finished, and warranted to give PERFECT SATISFACTION.

They are made of PATENT STEELED METAL, Which is FAR SUPERIOR to chilled iron. A large number now in use, and giving Entire Satisfaction.

Awarded FIRST and SECOND PREMIUMS at the Plowing Match of the HAMPDEN CO. FAIR in September last, over such competitors as the OLIVER CHILLED and the CASSADAY SULKEY PLOWS. Send for Circular and Price List.

BELCHER & TAYLOR,
AGRICULTURAL TOOL COMPANY,
Box 75 CHICOPEE FALLS, MASS.

AMERICAN ROAD MACHINE CO.

Successors to S. PENNOCK & SONS CO., Kennett Square, Pa., and GEO. W. TAFT, Abington, Conn.
Manufacturers of
IMPROVED ROAD MAKING IMPLEMENTS
for city, town and country streets and highways. MACHINES SENT ON TRIAL, and SATISFACTION GUARANTEED. Purchasers are assured of immunity from law suits. For circulars and colored cuts, address AMERICAN ROAD MACHINE COMPANY, KENNETT SQUARE, PA.

PERFECTION IN BUTTER MAKING.

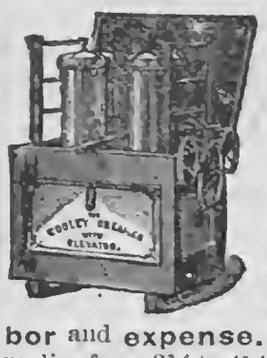
THE O. K. OUTFIT EXCELS THEM ALL.

O. K. CREAMERY Has the largest cooling surface, takes less cooling material, less labor, and gives best results. All cream raised between milkings. Skimming glass whole depth of can, showing condition of milk without touching creamery.

O. K. CHURN Has improvements over the best. Easy to clean, easy to operate. Made of White Oak. Cover Castings will not break.

O. K. BUTTER WORKER Made on scientific principles. Adjustable bed. Preserves the grain of the butter. Solid wood roller. THE MOST PERFECT Butter Worker ever put on the market.

JOHN S. CARTER, Sole Manufacturer, SYRACUSE, N. Y.



IT IS A FACT

THAT THE

COOLEY CREAMERS

Are used by more fine butter makers and stock breeders than any other apparatus, because they have proved to make the **largest quantity** and **best quality** of butter with **least labor** and **expense.** They surpass everything in the Cream Gathering System. Patrons realize from 3¼ to 4⅕ cents per quart for milk. Send for Circulars giving facts and references sustaining these claims. *Davis Swing Churns and Improved Eureka Butter Workers.*

Vermont Farm Machine Co., Bellows Falls, Vt.

The Machines are light, strong, easy-running, admirable in design and finish. Practical all-day Tools.

S. L. ALLEN & CO.
127 and 129
Catharine Street,
PHILADELPHIA, PA.

"PLANET JR" GOODS

Send now if you are interested in Farming, Gardening, or Trucking, for our 1886 CATALOGUE, which fully describes our Seed-Drills, Wheel-Hoes, and Hollow Steel Standard Horse Hoes and Cultivators. Free to all.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, APRIL, 24, 1886.

Subscribers of the RURAL *need never take the trouble to write us to "stop" the paper. It is invariably discontinued at the expiration of the subscription term, except by oversight, in which case it is our loss.*

If the number on your address label is 1891, your subscription expires with this number; if 1892, next week; 1893, in two weeks, etc.

If any of our Canada subscribers have not received the seed distribution, please notify us at once.

Thos. H. Jolliffe, of Natick, Mass., writes us: "The Japan Chestnut stood a temperature of 22° below zero this Winter, with only an inch or two of the tips injured."

The Poultry Special will be issued a a few days after May 1st. Many of our friends are showing a deep interest in the subject, and the Number promises to be as valuable as any of the Rural Specials.

If any subscriber of the RURAL NEW-YORKER *has not received the paper regularly, he will confer a favor by notifying us. We are anxious to extend the time far enough to make up for all mistakes or neglects.*

In the course of a year or so or more, we have little doubt that our contemporaries will take up the advocacy of the Japan Chestnut. We have certainly done our share during the present season—a share that will be forgotten by the many, but remembered by the few, and gratefully remembered, too, as we confidently believe.

Mrs. A. E. M. Carman, the wife and constant encourager and helpmate of the Editor of the R.N.-Y., in all of his work, will hereafter assume entire charge of the Domestic Economy Department. She will gladly welcome appropriate notes and articles from our lady readers.

Tornado-swept St. Cloud and Sauk Rapids, Minnesota, ask for help from the generous benevolence of the country. Both are in a comparatively newly settled section. The agriculture of the surrounding country afforded support to both before their misfortune; let the agriculture of the whole nation afford them help in their terrible affliction. The aggregate of many small contributions would make a generous sum. The mayors of both towns will make the best use of donations.

The first National Convention of Woolgrowers held the other day at St. Louis, had for its principal object the organization of the wool-growers of the country, so as to enable them in the future to influence national legislation with a view to protecting their industry against foreign competition. Resolutions were unanimously adopted urging the restoration of the tariff of 1867 or its equivalent, and denouncing the Morrison-Hewitt bill lately reported by the Ways and Means Committee of Congress, admitting foreign wool free of duty.

Twelve years ago two companion Hemlock trees were planted at the Rural Grounds. Both were injured the second year afterwards and cut back, one of them more than the other. Both are now beautiful, shapely trees. The one that was cut back the most is now a foot taller than the other. It is a pity that the effect of judicious pruning or disbudding evergreen trees while young is not better understood. In this way the White Pine may be made to assume any shape and to clothe itself with its lithe foliage as may be desired.

From year to year one's estimate of the beauty and value of trees changes. If we were asked to-day which of our evergreen trees we most value, we should at once answer Abies Alcocquiana. Our only tree was planted 12 years ago, and is now about 12 feet high. More graceful, less rigid than the Norway, it never has been injured in the least by sun or frost. One of its charms is the color of its leaves. Underneath they are covered with a gray or blue bloom, like the skin of a grape, while they are green above. The two colors blend so as to give a changeable effect that is as distinct as it is pleasing to the eye.

Beginning March 19, and finishing April 2d, we have sown short rows of the following kinds of oats. The older kinds have often been sown before, but for the purpose of comparison, it is necessary to have them side by side:—Welcome, American Banner, Badger Queen, Virginia Winter, Clydesdale (of this we have four acres), Hopetown, Russian White, American Beauty, Race Horse, White Belgian, White Schœnen, Triumph, Probsteier, Yankee Prolific, Improved Swiss, Improved Challenge, Dakota Chieftian, and half a dozen supposed distinct varieties without names. Several of those mentioned the Rural has already classed as the same. All of the above are high enough to mark the drills at a distance.

NOTICE.

THE PRESENTS

FOR SUBSCRIBERS who shall have sent us clubs will be positively awarded May 10th. We think that a pleasant surprise awaits them.

The most senseless "boom" is that which certain speculators are trying to work up about Alaska. Don't believe them! Because potatoes grew to a large size in a garden at Sitka and a few Alaskan hens did double duty, is no reason why a poor man should go there. You can raise larger potatoes and more productive hens within a dozen miles of where you now live. The mining interests of Alaska may develop, but such development will require vast capital. As a summer resort the country will be a success; as a farming community, never. Rural readers who have read Mrs. Fisher's articles know enough to keep away from Alaska. Turn yourself into an emigrant only as a last resort. Be contented and do your best on the old farm. You cannot imagine how much sorrow it will cost you to pull the old friends, old memories and old associations up by the roots. Make the best of what you have.

A mild, June day with scarcely wind enough to stir the leaves. The soil was moderately dry. We are speaking of April 14th, when, from seven in the morning until five in the evening, we (three of us) planted 30 plots of the same kind of potato, each with a different fertilizer or different combinations. It is, in part, a repetition of the series of experiments made two years ago, with important additions. The plots are in the same field upon a different part that has received neither fertilizer nor manure in many years, though it has been cropped every year. The stillness of the air and the pleasant day enabled us to distribute the fertilizers and to do the entire work in a most satisfactory way. A second series of experiments will be started in a week or so in the same impoverished field.

For the first time since the beginning of the present agitation about the tariff on wool, in 1882, the House Ways and Means Committee are distinctly divided on the question, the majority, headed by Morrison of Illinois, and Hewitt of New York, both Democrats, urging the placeing of wool on the free list, and the minority, headed by McKinley, of Ohio, and Reed of Maine, both Republicans, declaring in favor of a restoration of the tariff of 1867. The minority report well says that the arrangement of the free list is peculiarly an assault on the agricultural interests of the country, as out of 4,000 articles in the tariff, the leading products of agriculture are singled out for injury or ruin by unrestricted competition from abroad. Wool has been on the dutiable list since 1824; most of the other articles on it have been placed there since the beginning of the late war; yet it is now proposed to remove therefrom what over a half a century's experience has demonstrated should be there, and to allow other things to remain on it, though placed there avowedly to meet the temporary demands of war. The manufacturers of the country are beginning to realize that in removing "protection" from the agriculture of the nation, there is a great and growing danger that "protection" may, ere long, be also removed from its manufactures. If the farmer is to enjoy none of the advantages of the tariff, why should he suffer from all its disadvantages? The farmers' votes are decisive in tariff legislation, if once the farmers can combine on any particular policy.

TROUBLE IN THE BARBED-WIRE FENCE MONOPOLY.

Probably the most grasping and oppressive monopoly that now vexes the farmers and stockmen of the country is the Washburn & Moen Company. For years it has been buying up all the patents on barbed-wire fencing until now it controls over 100, and insists on a "broad claim" on the manufacture of every rod of barbed-wire fence made in the country. Successive suits at law and contests with makers have greatly reduced its extortions in the form of "royalties;" but it still exacts 15 cents per 100 pounds from all other manufacturers. Joliet, Ill., is the chief center of manufacture, most of the large and a large proportion of the small licensees being located there, and the annual "royalty" these have to pay amounts to from $250,000 to $300,000. The arch-monopolist is the most extensive manufacturer, and stringently insists that all the wire must be sold at a uniform price. The business is exceptionally dull just now. In competing for the unusually small demand, wholesale cutting of prices is charged. A telegram from Joliet on Monday says Washburn & Moen threaten "to paralyze the sale and monopolize the manufacture of the product on account of alleged cutting of prices, scalping and moonshining of the licensees." The latter claim that this threat is only a pretext or excuse for cutting by the patent holders who desire to monopolize in their own shops the whole barbed-wire fence business, and fleece the licensees. The cost of plain wire, these say, is $3.16 per 100 pounds; cost of barbing, 40 cents; royalty, 15 cents; total, $3.71. They maintain, however, that Washburn so controls the manufacture of plain wire that from the margin on that they have to pay 66 cents per 100 pounds to him. They are reported as threatening "to pool their product, refuse to pay royalty, manufacture their own plain wire, put 2½ cents per 100 pounds into a litigation fund, and fight to the bitter end." We hope they will. When a certain class disagree, honest men are likely to get their rights.

SPECIAL.

Those who, having applied for the Rural's present seed distribution prior to April 15th, have not yet received it, will kindly notify us by postal at once.

BOGUS BUTTER IN CONGRESS.

A fortnight ago the Rural, in speaking of the number of anti-"oleo" bills before Congress, said that had the introducers consulted together beforehand, and agreed upon a single bill combining the best features of all, it would have been better for the dairymen of the country. The House Committee on Agriculture has come to the same conclusion; for last Tuesday it appointed a Sub-Committee, consisting of Hatch, of Missouri; Green, of North Carolina; and White, of Minnesota, to draw a new bill "to regulate the sale of oleomargarine, butterine and other imitations of dairy butter." It is intended to combine in it the best points in all the other bills.

What is wanted is a bill that, first of all, cannot possibly be upset, in whole or in part, by the United States Supreme Court; for it is certain to be ultimately subjected to the decision of that tribunal of final arbitrament. Those interested in the manufacture and sale of bogus butter have too much at stake not to contest to the bitter end any form of legislation which shall discriminate against or in any way hamper or regulate their business. The manufacturers alone own to a yearly profit of $5,000,000; and the aggregate profits of those who sell the concoctions for what they are or as genuine dairy products, vastly exceed that amount.

Already they have a powerful lobby in Washington, fighting in their behalf. Special care should be taken to prevent any of these in the guise of a friend of the dairymen or an enemy of the oleo-men, from treacherously securing the insertion of any provision which might upset or endanger the validity of the Act. The National Government has a right to levy a general tax for revenue purposes on any line of manufacture. It taxes whiskey; why shouldn't it tax all imitations of, or substitutes for, dairy products? A tax of ten cents a pound would, it is thought by those thoroughly acquainted with both the dairy and "oleo" business, bring the cost of bogus butter up to that of the poorer makes of genuine butter, and while leaving a fair margin of profit to the manufacturers and retailers, take away from both the alluring temptation of palming off on the public the false for the real.

It should also be provided that all packages containing the goods must be plainly marked with large-sized letters indicating the nature of the contents; and that they must be kept within sight of purchasers until the contents of each package have been disposed of. Is there anything in the Constitution of the United States which forbids legislation prescribing a particular color for any particular line of products? If not, it should be provided that bogus butter should all be colored of some particular tint; if there is any doubt on the constitutionality of such legislation, it would be imprudent to endanger the Act by insisting on it. Provisions should be made for the stringent enforcement of the law; and to this end a part of each fine for any violation thereof, should go to the informer. Something of this kind we consider essential to the best results from any anti-oleo legislation. Officials may be bribed to neglect their duty or to shut their eyes to offences; but no swindling dealer or manufacturer is likely to run the risk of detection by the multitudinous and ubiquitous informer, whose interest in the results will make him press for a trial and devise the best means of securing a conviction.

The researches of the Department of Agriculture with regard to the anti-oleo legislation of the various States and the decisions of different Courts on various phases of it, should be an aid to the Sub-Committee in framing a law which, while affording adequate protection to the producers and consumers of genuine dairy goods, will not be unjust towards the manufacturers of, and dealers in, any healthful product which may honestly and openly compete therewith.

BREVITIES.

Plant the Red-flowering Horse-chestnut; the White Double-flowering Horse-chestnut. Plant the Purple Beech, Schwerdler's Maple.

Referring to our first-page cut of the Cayuga Grape, it may be said that a single vine was received from H. S. Anderson, of Union Springs, N. Y., May 30, 1885. It is a seedling of the Eumelan we believe. The vine has made a fair growth.

A farmer in Orange County, New York, has been prosecuted by Dairy Commissioner Brown for selling adulterated milk, and fined $100. Four others charged with the same offence, settled by paying $100 apiece. Excellent! But how many sellers of bogus butter in this State, have been forced to pay any fine through the efforts of the Commissioner?

Let us all work together to protect the birds. The agricultural press are a unit in favor of such protection. We want the help of every farmer and every farmer's family. The ladies can and will discountenance the wearing of feathers and plumes. The boys can stop the robbing of birds' nests and the killing of young birds. We want every farmer to put up a sign warning every "sportsman" and bird killer off the farm. We want your help. Can we not have it?

The time will come, when—war and pestilence being reduced—a vast population will crowd upon the soil and every available foot of it will be wanted for the yield of provision for human sustenance; then even the weedy plants will have full share of studious attention in all country common schools. Their seeds will be on exhibition and will be made familiar, and also themselves as leafy plants, and their habits. They will be necessarily scarce in fields and gardens then, for their destructive presence will not be tolerated.

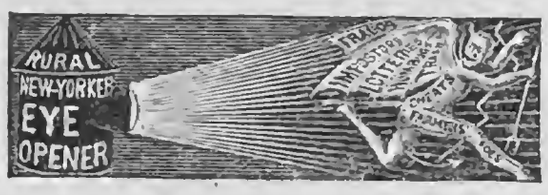
Early in the week a telegram from Portland, Oregon, told the world east of the Rockies that an English, German and Chinese syndicate had made a contract with the Mexican Government to send 600,000 Chinese to Mexico within a year, the Mexican Government agreeing to give each Chinaman 20 acres of land. That would be 12,000,000 acres. Mexico has no such area of cultivatable public land for gift or sale, even in widely separated regions. Perhaps the amount could be made up of such land that the more one owned, the poorer he would be—but even that is doubtful. Then fancy an immigration of 50,000 pig-tailed Celestials a month! The report is a hoax or a monstrous exaggeration.

Just at this season, before the leaves come out, an inspection of young apple and pear trees which have been making but little growth, will very likely show little white spots on the bark, which easily scale off when the thumb nail or a knife is used, leaving a reddish smear. The scale, like a tent covers the eggs or progeny of a female scale louse, which will, in June, invisibly to common eyes, begin to run about, seeking the new growth on which to feed. They drain this of the sap which should make new wood, or of some of its essentials; for the wood on which they exist on the bark is always very brittle, open, and imperfect, and very little of it forms. A brushing with coal oil before the buds open, destroys these vermin even under their scales; it is not a safe application on leaves or young growth, but can be freely and safely used on the firm bark before the buds swell.

Architecture.

A CHEAP COTTAGE.

For the plan of the neat, convenient cottage shown at Figs. 168, 169 and 170, we are indebted to our friend A. J. McDermid, Marion County, Ill. Fig. 168 shows the front elevation with a stone foundation; bricks or even posts would answer the purpose, where, as in some prairie sections, stones are scarce. Fig. 169 shows the ground-floor and the arrangement of the rooms, etc. At Fig. 170 is seen the second floor, and a study of the three illustrations will enable anybody to construct a similar building. The cost will depend, of course, on the size and finish of the house, and the price of materials where it is built. That shown here cost only $850.

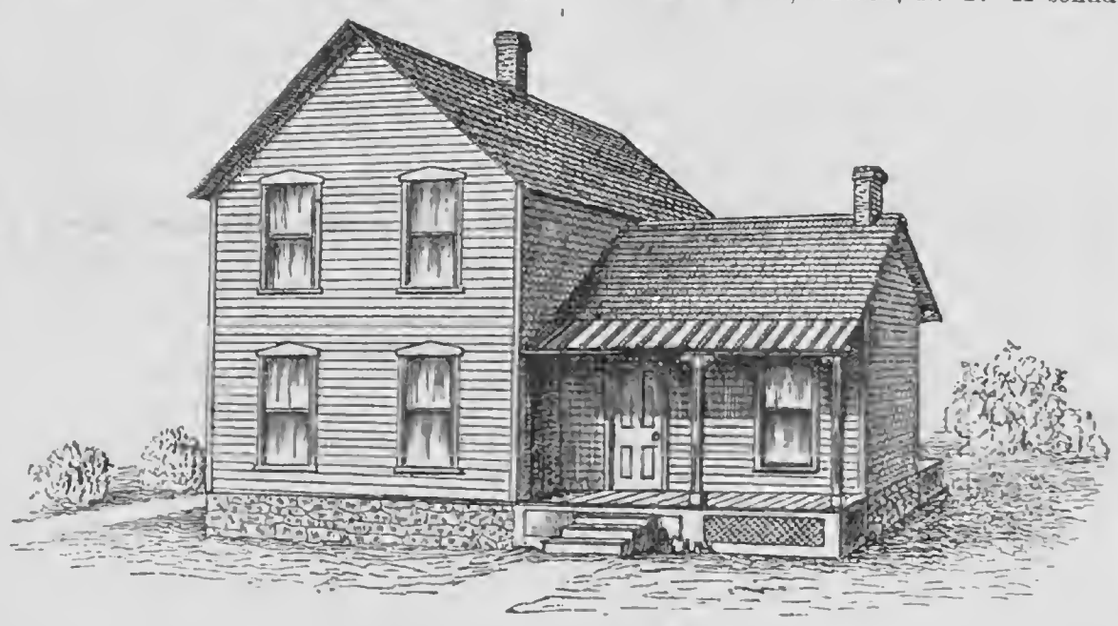


The old lottery swindle at St. Stephen, New Brunswick, Canada, has awakened from a godless sleep or risen from the dead frauds of the recent past. The vampire has changed its name a trifle; but it still preys upon the public as of old; but, of course, the modern vampire applies its suction powers to the pockets instead of to the veins of its victims. It used to cheat as the Royal New Brunswick Cash Gift Distribution; now it cheats as the Royal Dominion Cash Gift Distributions. The other was and this is a disgrace to the people of St. Stephen, who permit it to exist among them, and to the Government of the Dominion which should at once have suppressed so barefaced a swindle. Simpson was the name of the rascal who worked the former fraud; Beckwith is the scoundrel who runs this; but he was also a "co-partner" in the other. There is no difference between the *modus operandi* of both—tickets are sold for 25 cents each, 20 for $5, and the dupes are assured that every packet of 20 is sure to draw several prizes. Of these 5,231 are promised, amounting to $116,000. The Dominion Government made a "kind of a sort" of an investigation into the counterpart of this over a year ago, and found that of all the prizes ever offered, *not one* had gone to a subscriber. A prize went now and then to a confederate for advertising purposes: but no attempt had ever been made to hold a "drawing," and no prizes had ever been distributed according to promise. After paying postage on advertising circulars (amounting to about $40,000 a year), and other expenses, the swindlers cooly pocket the rest of the money sent in by their dupes.

"Nature's Incubator Company," of Quincy Ill., is a humbug, and its representations of the incubator it offers are "meant to deceive." The large number of complaints we have received leave no doubt on these points. Here is a specimen letter, from Sterling, Illinois:—"My daughter bought a 'Nature's Incubator' last February. It is a perfect clap-trap fixing—nothing at all like what the 'Company' represent it to be. From correspondence I have had with the concern since, I am convinced the company is even a more monstrous sham than its incubator. Although the humbug acknowledges that 'owing to the rush of business,' it sent out 'a large number of incubators that were improperly made,' yet it refuses to replace these with others 'properly made,' or to return a cent to those who received the worthless things." Other letters make it quite plain that the machine would have to be altered altogether before it could do good work.

Have absolutely nothing to do with the "new seed oats" offered by a certain seed company of Western New York. It is of the same stripe as the Hulless & Bohemian Oats tricks which the Eye-opener has been denouncing for the last seven years, and by which the farmers of many of the Western States have been swindled out of tens of thousands of dollars. Every man who engages in such an "enterprise" is sure to turn out a swindler or a dupe; do you want to be either, especially as the chances are ten to one that you will be the latter in spite of notes given, bank deposits made or other means of quieting the consciences, or lulling the suspicions of the tempted?

To Several Inquirers.—The principal Florida "land frauds" which have been widely advertised and have succeeded in gulling the public most extensively, are Sarasota Bay, Palma Sola, Marion City, Grant Park, Parkersburg, Parkersville, De Witt, Belmore City, Silver Springs Park and Bertram. In the Rural of December 19, 1885, the Eye-opener denounced nearly all these from personal acquaintance with the locations, and several times since then the frauds have been exposed here. There really are such places; but the representations with regard to the number and character of the population, buildings and business enterprises as well as with regard to the nature of the locations and the surrounding country, and of the industrial resources and work in the neighborhood and the travel and traffic facilities, are all either sheer fabrications or, at best, gross misrepresentations. The places are very nice on paper; but the streets, public buildings, most of the stores and private residences can be found nowhere else. "Lots" in these "paper cities" are generally offered for sale for more than the price paid for acres by the sharpers (mostly Northern men) who engineer the swindles. The orange groves which delight the eye and flatter the hopes in the prospectuses and advertisements, are in the future; all in the present consist at most of a few lately planted trees set out as a foundation for misrepresentation by the original schemers, or as an experiment by some of their dupes. Generally the surrounding country is either swamp land or sand too poor to produce any profitable crop. There is a good deal of really excellent land in Florida; but all the choice locations have already been taken up and are now held at high prices. . . . . We do not recommend the goods advertised by the Dennis M'f'g Company, *alias* Dr. M. D. Dennis. . . . . We cannot answer inquiries about the standing of local insurance companies conducted on the "mutual" principle. Some of them are excellent; others are swindles. The authorities of Penusylvania have lately suppressed a dozen or so of the latter kind which preyed chiefly upon the country people of the Keystone State; the authorities of Indiana are now engaged in a similar praiseworthy untertaking. The best way to find out about such concerns is to apply to the Superintendent of Insurance at the capital of the State. . . . . We cannot recommend the Lee Seed Co., *alias* the Dandelion Bitter M'f'g Co., *alias* the Kennel Rose Co., *alias* etc., etc., of Southington, Conn. . . . . Yes, the Monarch Lightning Saw Company, of Chicago, Ill., is, in one way, a "responsible" concern—it is responsible for much profanity and anger caused by the worthless character of the goods it sends out. We have had a great number of indignant complaints with regard to this concern. . . . . We do not recommend the "Harris Remedy" of St, Louis.



A CHEAP COTTAGE. Fig. 168.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

The Dog in Health, Habits and Disease. A pamphlet of 105 pages, from R. C. Hartranft, Philadelphia, Pa.—A well arranged and very readable book. The general habits of the dog, description and history of the various breeds, how to breed and feed and how to handle the common diseases, are all treated in a condensed and practical manner. To all those who are interested in the training and breeding of dogs this little work will be of value. It would be well if more interest could be taken in the breeding of good dogs. The common curs and mongrels of the country are so plentiful that they sadly injure the reputation of the really valuable dogs. The fact is that no animal makes a greater return, in intelligence and usefulness, for care bestowed upon his training and breeding than does the dog. We should seek to exterminate only the curs and worthless animals.

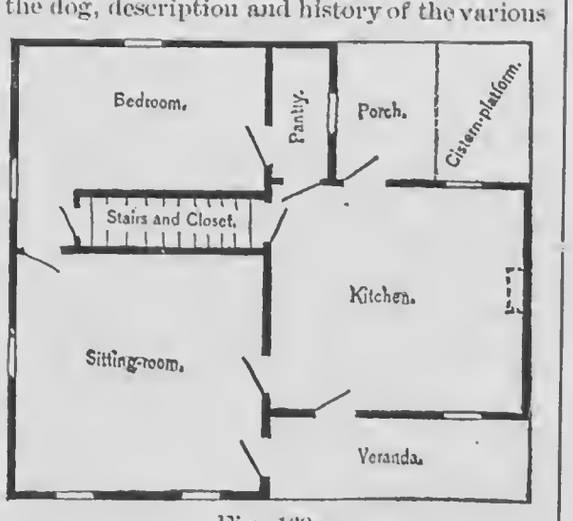


Fig. 169.

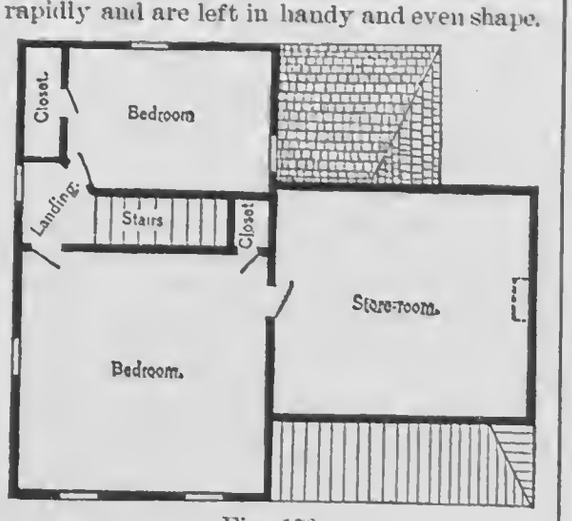

Fig. 170.

Stoddard Creamery and Refrigerator.—A full list of circulars from the Moseley & Stoddard Manufacturing Co., Poultney, Vermont. The Stoddard Creamery and churn are known wherever dairying is practiced. In this circular these implements are so well described that a child could understand their use. Many a long dairy article contains less practical information than is to be found in the Directions for Making Granulated Butter. If dairymen would follow these instructions, there would be much less complaint about bogus butter. Besides the creamery and churn, this house furnishes dairy scales, butter packages, butter prints, Monitor milk pails, lever butter-workers, patent milk strainers and dog powers, all of first quality. The circular headed "Why" gives the reasons why these goods should be used far better than we can. Send for it.

Henley's Monarch Fence Machine.—An elegant new catalogue from M. C. Henley, Richmond, Ind., describing and illustrating this celebrated fence machine. Beautifully printed and well arranged. Our friends will go far before finding a catalogue containing more common sense on the art of fence building than this one contains. The fence made by the use of this machine is cheap, durable and handsome. Where fences are to be used—and few communities have reached a state of civilization that will justify them in doing away with strong boundary lines—these three essentials should be included. Send for the catalogue.

High-Grade Fertilizers.—Circular from John M. Pearson, Hudson, N. Y. A sound, sensible and readable circular. It will pay any farmer to read the conversation entitled, "Fertilizers—Pro and Con," and the article on Soils and Plants. The use of good commercial fertilizers increases from year to year. Each year deserters come over from the ranks of those who have heretofore objected to "poisoning" or "burning" the land. Time makes clearer and clearer the truth of the Rural's assertion, that if we could burn barnyard manure and still retain its nitrogen, we would have, in the ash, a "complete" commercial fertilizer.

The Concave and Curved Potato Knife, from Humphrey Bros., Wakeman, Ohio.—As before stated in the Rural, this little implement gives excellent satisfaction. It will pay even those who plant a small patch to procure one of these knives. The seed pieces are cut rapidly and are left in handy and even shape. Where the seed is to be prepared for an Aspinwall planter, this little tool will give excellent satisfaction. It is improved this season. Price by mail 35 cents.

Circular of High-Class Poultry, from Jones Wilcox, East Chatham, N. Y.—First-class specimens of Wyandottes, Plymouth Rocks, Langshans, Hamburgs, American Dominiques, Leghorns and Pekin Ducks are used for breeding stock. It is unnecessary for us to speak of the characteristics of the various breeds; they are so well pictured and described in the catalogues of fanciers that but little more can be said concerning them.

Cornish Organs and Pianos. Circular from Cornish & Co., Washington, N. J.—A description of the various organs and pianos manufactured by the above firm. All styles are represented, from the "Gem," costing $50, to the Pipe Top Grand Organ, costing $160. There are plenty of homes in the country yet that are not supplied with music.

For Women.

CONDUCTED BY MISS RAY CLARK.

THE FARMER'S LIFE.

AN OLD SONG.

The farmer's life is a life for me,
I own I love it dearly,
And every season full of glee,
I take its labors cheerily.
To plow or sow, or reap or mow,
Or in the barn to thrash, sirs,
All's one to me, I plainly see,
'Twill bring me health and cash, sirs.

The doctor's styled a gentleman,
But this I hold but humming;
For, like a tavern waiting-man,
At every call he's coming.
Now here, now there, must he repair
Or starve, sirs, by denying:
Like death itself—unhappy elf—
He lives by others dying.

The lawyer leads a harrassed life,
Much like the hunted otter;
For twixt his own and other's strife,
He's always in hot water.
For foe or friend his cause defend,
However wrong, must he, sir,
In reason's spite, maintain his right
And dearly earn his fee, sir.

Then let me live a farmer's life,
Obtaining while I lead it,
Enough for self and some to give
To such poor souls as need it.
I'll dredge and fence, nor grudge expense
To give my land good dressing,
I'll reap and sow, or drill in row,
And hope for Heaven's blessing.

SKETCHES OF GERMAN LIFE.

BERTHA A. ZEDI WINKLER.

THE COUNTESS.

Some people carry romance in their faces, some in their disposition, and some in their real life. But I have never met with one and the same person so thoroughly romantic in all respects as the daughter of the Count who was the subject of my last sketch.

In the days of barbaric Germany, she might have been a beautiful seeress, like Velleda; in the Middle Ages, the championed lady of the noblest knight that ever sat at King Arthur's Round Table; now, in the real present, she simply carried about her the essence of these storied ages, animated in her beautiful person, and realistic in the conduct of her life, so full of strange reverses, so unaltering in cheerfulness, charity, sympathy, and withal truly royal dignity.

What her life was amid the gayeties and splendors of a court, no one in that little village knew. That she had been there was enough to fill their simple minds with awe. If she loved her life there, it was a rude shock to be transferred to the loneliness of a forest border and the society of unsophisticated inferiority, for which she had the people's delicate, unspoken sympathy. But her glad smile, her active interest in the life around her, never betrayed the sadness that may have been within. She was an aristocrat within and without; proud in her misfortune as she was proud of her lineage, which no king's frown could destroy. But that pride of ancestry was never obstrusive or offensive; it was never a claim or an assertion; it was a possession which needed no calling attention to. Men instinctively felt it an honor to doff their caps to her, and the women did not have to tell their children to kiss her hand as they had to when the pastor called and benevolently patted them on the head.

I shall never forget the first time I laid my eyes upon her and the beautiful incident that endeared her to me. My mother, when I was only seven years old, had occasion to leave the city in which we were born, and take up her abode in that little village. The distance from the railroad station to E was four miles, no short walk for a frail woman carrying two children on her arms and the third one trudging beside her and holding on to her skirts. We were very tired and had been resting several times by the wayside, when a figure dressed in a tight-fitting gray hunting habit issued from the woods followed by a large dog. I hid from the dog behind my mother, and peeped inquisitively at the stately woman. She nodded to my mother with a half anxious and questioning look at the crying babe in her arms.

"If you are going to E——, madam, I should

be so glad to relieve you somewhat of this beautiful babe."

Without waiting for an answer she had taken my younger sister from my mother's arms and was walking beside her. I lagged just far enough behind to observe her and listen to her thrilling voice, without being noticed doing so. She looked so different from the people we had hitherto met—so grand in her hunting garb that I thought she must be some great fairy come suddenly out of the woods to my mother's relief, and was sure she would vanish at the village entrance. So I drew timidly towards her as we neared it.

"Give me your hand, little one, you must be tired." Oh! what music there was in that voice; and all the while she was talking to my mother I held on to that gloved hand of hers with a throbbing heart. For if she was a fairy she would be going soon and I wanted all the reality in that dream that I could get.

When, however, all along the road hats were doffed to her, I began to realize that she was a real and great person, and that it might be disrespectful to hold on so tight to her hand. It was not till my mother thanked her, however, and called her "Grafin," and "Your Grace," that I knew she was a countess.

To describe her personal appearance without being able to convey the sound of her voice, the light of her eyes, and her various attitudes of inimitable grace called forth by the occasions and the moments, is like describing music with which you have been thrilled—you can give an idea of it, but you cannot produce the effect.

So I think it best to let glimpses of the beauty of the Countess be mingled with its traits of the woman as she moved among the lowliest, and made new the old old story of Jesus, by her glowing word-pictures of Biblical lore, and by a dignity with all which made her look most beautiful, when she sat on the grass in the midst of a crowd of barefooted, eager-faced children.

The Sunday-school founded and managed by the Countess was the resort of young and old. And, though the children had the front seats, and her attention was entirely directed to them, parents went home sometimes thinking more about that explanation of the lesson by the Countess Ida, than about the preacher's sermon. There were no tedious firstly's and secondly's. She gave them every day illustrations; and made Bethlehem as familiar to them as their own village, and Christ as a Saviour who might be stepping into their midst, at any unexpected moment. The stories in the gospels were strangely new after her reading.

On pleasant Summer days, Sunday-school was held in the open air. Those were days to which we looked with especial longing. We made Sabbath excursions into woods, the fields, and the hills wherever the subject of the Bible lesson for that day seemed most likely to meet with the objects for illustrating it. How really we seemed to wander in Bible lands; when with our books under our arms we followed the stately Countess to the vine-clad hills, and there sang our hymns, and read its lesson of the fig-tree, or of the vineyard and the vintners, and were transported in imagination to the hills of Judea. Our hearts were filled and running over with religious enthusiasm. We thought ourselves a younger set of disciples, and the holy gentle influence of such a day was with us all the week. Our evening pastime was often just sitting in a cosy group, to talk about our Sabbath-school and our teacher.

The Countess was seldom accessible to anybody on week days. One might meet her accidentally on the road with her knitting and her great Newfoundland dog, but then it was only a pleasant greeting from her, and the vision would be past. This was what made her all the more precious to us. She was never a familiar object. In spite of her hearty participation in our joys, she was always a great Countess to whom we looked up as to a higher being. We never even ventured to touch her skirts or walk nearer to her than at arms' length unless encouraged by her kindly smile. Once I remember climbing a steep hill to get the first wild rose of that early Spring; when I handed it to her, flushed with gladness, she stooped and kissed me. That was the most delirious moment of my life, and I can yet see her great dark eyes beaming with love into mine. That was the first and last time she showed any partiality to my knowledge; and it seemed with her as much an impulse of the moment as the bringing of the rose was with me.

THE STARVING HEART.

"I AM a bride no longer, scarcely a wife, *only a servant*," and the speaker finished with a tearless sob which went to my heart. It was no querulous, weak woman who said this, but one who had great intellect, with a loving, sensitive nature; but the constant strain of responsibility, care, and work, had made the woman's heart speak out. It longed so much for the loving, protecting care of him who had bestowed it so lavishly at first, when she needed it much less than now. The unused piano, unread books, untouched fancy work, all told the sad tale of her present life. She who was by nature so refined and cultivated, and who was made to enjoy the beautiful, had come to live where "his folks" thought all tastes, aside from bone labor, were foolishness in the extreme. Her husband was neither heartless nor cruel—only as far as he was thoughtless and careless. He did not intend to sap the life of her whom he had so proudly brought to his home. But he forgot that she was of different mold from his own tough, wiry, hard-working, yet never tired, family.

I am not one who thinks that men are always to blame in such cases, because I know they are not, but why do they not open their eyes and see what is before them? In this case the sad facts remain. Although straining every nerve to do what each day brings for her, she is not willing to acknowledge even to herself how slowly, but surely she is declining.

Time passes on and she is laid away on the hillside, leaving her little one to the care of strangers. His folks say: "Poor thing! she was so incapable and had not much ambition."

The world jogs along just the same as though that little grave did not cover a broken and starved heart. But we shall know why these things are so sometime. ANON.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

A RENOVATED ROOM.

"A PERPLEXED FARMERINE" asks an oft-echoed question, how she may remodel an old-fashioned room, so that it may be like that of Madame Arachne, "the prettiest little parlor that ever you did spy." Doubtless she is not the only one in like position, so we cheerfully give her an open letter in the columns of the RURAL.

The parlor we are to modernize has light paper with a scarlet border, a large-figured carpet, with scarlet as the predominant hue; black hair-cloth furniture, marble-top table, a handsome mirror, and lace curtains. All good, and but little worn. Having cleared the decks for action, our first thought is about wall and ceiling. Light-colored wall paper, like the Chinese, must go—we should substitute a warm brown, with a small pattern of gold and fawn, or some similar mixture, having, of course, some harmonious border. The old paper being well scraped off, "Farmerine" could doubtless re-paper the room with her own nimble fingers. This work, though requiring dexterity, is not so difficult as it appears, and is much simplified when two can engage in it, one to hang, and the other to paste and wait upon the hanger. The ceiling is probably kalsomined, a work which might also be done by the presiding genius. We should recommend a tinted greenish-gray kalsomine as preferable to white. Next comes the question of carpet, and this is indeed a "crusher," as Mr. Swiveller would say. The present floor covering is large in patterns, but little worn, says Farmerine. If the exchequer would permit, it might be relegated to a bed-room, to make room for a more modish article. But as the Lord High Everything Else says, "it is our duty to see that a due economy be observed," such expenditure must be out of the question. Or we may alter the carpet by the addition of a sober-hued border. The border is not expected to fit into any little recesses or odd angles—these should be covered with the carpet itself—but it should edge all the central square, giving the impression of a large rug covering the floor. Or we may tone down the coloring with dark rugs; but in any case we should find that the dark wall-paper makes a very noticeable difference, rendering the carpet much more subdued in effect.

Now for the furniture. It is not, says the writer, old enough to be fashionable, but being covered with black hair-cloth, is doubtless strong and well made. Our advice in this direction is brief enough—cover it. The household reconstructionist will not find this so difficult a matter as it seems; the old covers carefully removed, will serve as patterns both for shape and manner of work. Of course, measurements should be taken beforehand, to find how much stuff will be required, the material being two yards wide. A very nice furniture covering is a brocade or brocatelle of jute, much resembling raw silk; it wears excellently, and may be bought for $2 a yard. Rep will, of course, cost less than the brocatelle, and though not so handsome, it is very nice-looking and certainly less funereal than the hair-cloth. The covering is fastened on with upholsterers' nails and finished at the edges with gimp; the latter is put on with upholsterers' tacks, which are small enough to be scarcely noticeable. It is not at all necessary that all the furniture should be covered alike. Indeed, parlor suites are now quite out of date, a great boon to housekeepers of small means, since the present fashion allows them to purchase odd pieces from time to time. So, should "Farmerine" desire, she might cover her sofa or easy chair with brocatelle, the remainder with rep, or *vice versa*, taking care that the colors contrast agreeably. Shades of brown and olive, with a touch of gold in the brocatelle, would harmonize nicely with the wall paper. Crimsons should be avoided, as, although they are charming in upholstery, the scarlet in the carpet would kill such a hue. "Farmerine" may possess some article in her "seven years' trunk," suitable for covering a single piece. We have heard of an old felt piano cover being dyed and used to upholster an arm-chair. The marble-top table must have a scarf thrown over it; olive-brown felt would be charming, the ends decorated with an outline design in gold tinsel. Single-width felt would probably be wide enough; it costs 45 cents a yard in New York.

Next come the windows—the architect, liberal soul! has favored the room with four of these, so we may be sure of health-giving sunlight in abundance. Our friend mentions lace curtains, but says nothing of shades. These are, of course, necessary; our own taste leans decidedly towards Scotch holland, which comes in tan and ecru shades, giving a soft and agreeable light to the room. Such shades, of good quality, trimmed with fringe, and having spring rollers, all complete, cost $1.40 each.

The question of lambrequins is rather difficult to decide without seeing the style of window. We may unhesitatingly say that the best thing to do would be to purchase curtain-poles; they need not necessarily be expensive. You can buy nice-looking poles of stained wood with brass rings for 35 to 50 cents: poles with wooden rings are more expensive, beginning at about 60 cents. These are five feet long. The lace curtains, being, our correspondent says, of good quality, and little worn, would not look at all out of date when hanging from poles. In this case, no lambrequin would be necessary. But should "Farmerine" incline to a lambrequin, this should be placed on the pole instead of the curtain; it should be a straight breadth of stuff three-quarters of a yard deep, hanging from the rings in straight folds. Felt, similar to the table-scarf, would be handsome; it must be some thick stuff. Cotton plush—otherwise double-faced canton flannel—is not by any means to be despised for this purpose. With the lambrequin, the lace curtains should, of course, be fastened beneath, in ordinary fashion. The newest style of mantel lambrequin has the drapery hanging from a pole, after the style of a window curtain, differing only in that it hangs flat, rather than in folds. The pole is the length of the mantel, fastened 15 inches above the shelf; the lambrequin, hanging from the rings, is caught at the back of the shelf by invisible tacks, to prevent it from sliding forward, and falls over the edge of the shelf in front for the depth of two inches; at the ends it hangs 12 inches deep, and is finished with embroidery.

"Farmerine" tells us that she possesses books, pictures, and fancy-work, so there is little doubt that with the expenditure of a little money, and more time and ingenuity, her sunny room will be a joy forever to its deft-handed presiding genius.

DISHES FOR A LATE SUPPER.

DELICACIES TO TEMPT WHEN THE CLOCK STRIKES TWELVE.

THE following modest and economical supper ménu I hope will meet the requirements of those who are fond of giving little evening entertainments:

Jellied Chicken. Salad Rolls.
Ham and Sardine Sandwiches. Lobster Salad.
Compote of Strawberries. Punch Jelly.

Dress a pair of fowls as for roasting; omit the stuffing, and boil in as little water as possible until they are so tender that the meat drops from the bones. Cut the meat in small pieces and season with salt and white pepper, and the least bit of grated nutmeg and lemon-rind. Line a mold with slices of hard-boiled eggs, place next a layer of chicken, and so continue with alternate layers of hard-boiled eggs and chicken until the mold is two-thirds full. Reduce by boiling the water in which the chickens were cooked until not more than half a pint remains. Season this and pour it over the contents of the mold, and set over-night in a cold place. If the weather is very warm, take the precaution of adding a tablespoonful of soaked gelatine to the stock for fear of its not being stiff enough. Garnish the dish on which you have turned the contents of the mold, with light-colored celery leaves, dark-green parsley and bright-red beets cut in fancy shapes.

In order to make good salad rolls you must know how to make Mayonnaise, or you may use a dressing given in a late number of the RURAL for crab salad. Cut in dice some cold chicken or turkey with a little tongue or celery, and mix with enough Mayonnaise to moisten it; cut bits from the tops of small rolls, remove the crumb from the inside, and fill with the above mixture. This is not a costly dish, if you will take the precaution of having poultry for dinner a day or two beforehand. A very little meat that may be left, with the mixture of tongue and celery, will be sufficient to fill two or three dozen rolls.

Ham sandwiches are not new, but this way of making them may be new. To a half-pound of minced, boiled ham add half a teaspoonful of oil, half as much lemon-juice, and a little dry mustard powder and Cayenne; mix thoroughly with the ham, and spread it on bread, buttering the slice before cutting it. Trim off the crust, and cut into little squares, and put two pieces together.

For the sardine sandwiches, bone and skin some sardines, pick them fine, season with lemon-juice, pepper and salt, and a little anchovy essence if you have it.

For the lobster salad, cut the meat of a cold boiled lobster into dice, and lay it aside while you prepare the dressing. Rub the yelks of two hard-boiled eggs smooth with the coral—if any—and one teaspoonful each of mustard, salt and white sugar; add two tablespoonfuls of oil slowly, and moisten with vinegar as they stiffen until a smooth cream is the result. Finish with Cayenne and lemon-juice. Pour this over the minced lobster and toss up well with a silver fork. Put it in the center of your salad bowl, lay a ring of the slices of the eggs around it, and outside of this cool, white lettuce hearts.

Compote of Strawberries. Put a pound of sugar in a porcelain sauce-pan and simmer over a slow fire for ten minutes, skimming the while. Select large, firm berries; drop them carefully into the sirup, and at the first sign of boiling remove them from the fire. Let them remain in the vessel until cold; place them on a compotier, one by one, points up, in the form of a cone, and pour the sirup around the base.

Punch Jelly. Soak a box of gelatine in a pint of cold water for an hour; pour over it a pint-and-a-half of boiling water; stir till it is all dissolved; add the strained juice of one orange and three lemons, one gill of strawberry juice, a pound of loaf sugar and a small stick of cinnamon. Let this boil rapidly for two minutes and strain through a jelly-bag; add a gill of good brandy, another of Jamaica rum; pour into molds and put on ice.

PALMETTO.

WALL PAPER.

IF people living in the country, who are intending to have rooms papered, would take the trouble to go to the nearest town or city and select their own paper, instead of depending upon the taste of the village paper-hanger, they would save themselves many a heart-ache. The walls of a room and the floor are the most conspicuous parts, and, therefore, too brilliant coloring and patterns should be avoided. There are so many cheap but pretty papers of soft and neutral tints, that there is no need to cover your walls with scarlet peacocks, or blue and yellow morning glories as big as sunflowers. There is a plain gray paper that is very restful to the eye, and forms an excellent background for pictures. For a room that is to be used as a library, or one with an open fire-place, a paper with a good deal of red and gilt and a dado of dark olive shades gives a very rich effect. I have seen a sort of frieze of small Japanese fans used on a white or dull-colored wall, that made a very pleasant relief, but if you are not quite sure of your taste in the matter, you had better not attempt any great amount of decoration with these fans. I have seen rooms that resembled nothing so much as a doll's house, and which were rendered positively absurd by the excessive use, without any taste, of Japanese decoration. B. B.

CHILDREN'S TOYS.

I HAVE found that a box large enough to hold all the children's playthings, and low enough to slip under the table or lounge, is a great help in keeping a room neat. If a child is taught that he must never go out, or to a meal, or to bed, without first picking up his toys, he will soon take great delight in doing it neatly, and it will be as much play to him as anything else. "Now I've dot tu dit my wort done," is a saying that I hear from my little three-year-old 20 times a day, and as many times he will proceed to "straighten up" the room. Blocks are the cleanest toys and seem to furnish the most fun. Mechanical toys that are always getting out of order, only

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria,

make a child ill-tempered, and the very ease with which he can pull them to pieces, teaches him to be destructive. If you paper the box inside with a remnant of wall-paper, and cover it on the outside with a bit of old dress goods, it will not be unsightly. If you are a good carpenter, or if Jack is, fasten the cover on with a pair of hinges, and stuff and cover it, and when closed it will make a nice foot-stool. MOTHER.

SCENT BAG.

THIS is a very pretty conceit for a parlor or sleeping room. Take two pieces of surah silk of contrasting colors, about 10 inches long and not quite so wide. Sew them together the longest way, leaving the ends open. Fringe the ends and fill with a piece of cotton on which you have sprinkled violet sachet powder. Tie shut three inches from the ends with narrow ribbon, leaving a handle by which to suspend it from the back of a chair. In a few minutes the whole room will be exquisitely perfumed. J. B.

SOFA AFGHANS.

IN answer to an inquiry in regard to these, a very pretty one is made of alternate black and Roman strips. The black strips are handsome knitted in plaids: knit eight stiches plain and then purl eight; continue this for eight rows, and then reverse. For the Roman strips select your colors judiciously, with a bit of Roman ribbon for a guide. A pound will knit a small one, but they are generally made larger, and are very much used at present to throw over a bed in the day-time. M.

DOMESTIC RECIPES.

CREAM PIE.

FOR the crust make a cheap sponge-cake with three eggs, one-and-a-half cup of sugar, two of flour, half a cup of cold water, and one heaping teaspoonful of baking powder sifted through the flour. Beat the eggs and sugar together, add the water, then the flour. Flavor with lemon, and bake in two deep pans. When cool, split in two with a sharp knife, and fill with cream. For this put a pint of milk in a vessel and set it in another of hot water. Beat together two eggs, one scant cup of sugar, half a small cup of flour, and a little salt until light and smooth. When the milk boils, stir it in and cook 20 minutes, stirring often. Flavor to suit. The pint of milk must be a generous one. A SUBSCRIBER.

INDIAN PUDDING.

Scald a cup of Indian meal with one cup of boiling water, add a cup of molasses and a teaspoonful of salt and a quart of milk. Spice to taste with cinnamon, nutmeg and cloves, and bake one hour, stirring it three times meanwhile. Serve half cold. Cheap, but good. ANNIE.

POTATO CHOWDER.

Cut half a pound of salt pork into thin slices and fry slowly a light brown, add five large sliced onions. Let them color slightly. Put a layer of pared and sliced potatoes in the soup kettle, then a thin layer of pork and onions, season each layer with salt and pepper, and dredge with flour. When all the ingredients are used, cover with two quarts of water, let it come slowly to the boiling point, and cook 40 minutes, or until the potatoes are done. About two quarts of potatoes will be needed. Any herbs, such as parsley or young celery tops, may be used also. FARMER'S WIFE.

CLARA'S COOKIES.

One cup of butter, two of sugar, three of flour, four eggs, one-half teaspoonful of soda, three teaspoonfuls of milk. May be varied by using two eggs and one tablespoonful of milk.

CREAM COOKIES.

One cup of cream, one of sugar, one egg and one small teaspoonful of soda.

MRS. J.'S COOKIES.

Three cups of flour, one of sugar, one of butter, two eggs three tablespoonfuls of sour milk, one even teaspoonful of soda, one spoonful of lemon.

MRS. W.'S COOKIES.

One teacupful of sugar, one-half of butter, one teaspoonful of soda, two eggs. Mix hard enough to roll out.

MRS. P.'S COOKIES

One cup of butter, one of cream, three eggs, one-and-two-thirds cup of sugar, one teaspoonful of saleratus. Very rich and good.

GINGER CAKES FOR BREAKFAST.

One cupful of New Orleans molasses, one of sugar, one of butter, two teaspoonfuls of soda. Put half a cup of hot water on the soda, pour this on the butter, mix soft, roll out, and cut like cookies. Bake in a quick oven. Use ginger to the taste.

ONE-EGG CAKE.

One egg, three-fourths cup of sweet milk, butter size of an egg, one cup of sugar, two-and-one-half of flour, two teaspoonfuls of baking powder. Flavor to the taste.

AUNT RACHEL.

Vitality and Color

Are restored to weak and gray hair, by the use of Ayer's Hair Vigor. Through its cleansing and healing properties, this preparation prevents the accumulation of Dandruff, and cures all scalp diseases.

When I commenced using Ayer's Hair Vigor my hair was weak, thin, and gray. My scalp was also full of dandruff, and itched incessantly. Two bottles of the Vigor removed the dandruff, stopped the irritation, restored my hair to its original color, and so stimulated its growth that I now have an abundance of long black hair. The occasional use of this remedy keeps my hair and scalp in perfect condition.—Florence J. Cannon, 759 Clinton st., Trenton, N. J.

Ayer's Hair Vigor

is, in every respect, the most cleanly of all preparations for toilet use.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists and Perfumers.

THE HEAT OF SUMMER easily prostrates a man whose blood has lost its vigor by excess of uric acid. It can be rapidly corrected by that great blood tonic, Warner's safe cure.

News of the Week.

HOME NEWS.

SATURDAY, April 17, 1886.

THE authorities of Montreal have begun a crusade against the nude in art. Action is to be taken against one of the wealthiest gentlemen in the city, for keeping in his house copies of the Venus of Milo, the Venus di Medici, Canova's Venus, Power's Greek Slave, the Lacoon, and other works.....St. Cloud, Minn., is several miles back from the west side of the Mississippi, 75 miles north of St. Paul; population about 6,500. Sauk Rapids is three miles above on the other side of the river; population about 3,250. Wednesday about 4 30 P. M, a southwestern tornado struck both, clearing a swath 600 yards wide, and leveling 150 to 200 houses in St. Cloud. According to latest advices, 4 killed and 125 wounded in St. C.; 34 killed and 90 wounded in S. R. Great destruction of property; much mourning and distress.....Same day, a tornado at Burlington, Mo., did much damage, and another at Monroe, Mo., killed three passengers, injured several others, "destroyed dwelling-houses, barns and out-houses, killing thousands of dollars worth of stock".....Another in Wise County, Texas, "swept everything before it, injuring 12 persons, and destroying a number of houses and other property.".....A wirlwind in Jamestown, Dak., destroyed a brewery, but did much damage to offset the good deed.....A tornado at Exira, Ia., blew down over 50 houses and did a world of mischief...The U. S. Senate performs "executive business"—confirming or rejecting Presidential nominations, discussing treaties with foreign countries, etc, etc.—in "secret session," from which all except Senators are excluded. Senators and the few neccessary attendants are bound by honor and oath to tell nothing of the doings in such sessions; but such information always leaks out, especially if of an important nature. That all disenssions should now be open is a growing opinion among Senators, and a very decided conviction among newspaper men who would then find considerably more materials for their columns. Many Senators are therefore urgent for the abolition of "secret sessions," and, of course, all the newspapers unanimously insist on the wisdom of the change, and on the old-fogyism, folly, stupidity and "total depravity" of all who dare cling to the time-honored custom. Of course, the "press"—the Third House—is right....For the first time, under the new suffrage law, women voted for city officers, last Wednesday, in New Brunswick, Canada.....The iron and copper mining districts of Michigan "are preparing for an exodus of miners and speculators" to Alaska, on the representations of a number out there already.....The Senate, by a vote of 35 to 10, has rejected the President's recommendation of a Joint Commission for the settlement of the fishery question with Canada. Ice and bait, being articles of commerce, American fishermen have a right to buy them in Canadian ports, under British and American law, as Canadians have a right to buy them in our ports. It is also maintained that American fishing vessels have just the same rights as other American vessels in Canadian ports, and remonstrances against Canadian action have been sent to the Imperial Government.....The subscription list for the $20,000,000 Canadian Pacific Railway bonds closed in London Tuesday. It is reported that the applications reached $30,000,000.....Sec. Manning is improving and will resume his official duties soon," say some. Daniel E. Lockwood, of Buffalo, N. Y., has received from the President a tender of the Treasury portfolio in view of the disability of Secretary Manning," say others.....The report of divers settle that the plates of the wrecked Oregon had been driven *in* by collision from outside, not *out* by a dynamite explosion among the cargo, as alleged. The hole was six feet high: three broad, vessel broken nearly amidship; nearly all the cargo recoverable.....The Senate has voted to admit Washington Ter. as a State.....The House is still wrangling over the admission of Dakota as a State. One bill divides the Territory, east and west, on the 46th parallel; another, north and south, on the line of the Missouri, and there are several other propositions. Conflict of plans excuses delay of action.....Rhode Island has passed a prohibition Constitutional Amendment "by an overwhelming majority." Liquor men dumbfounded; others jubilant...In Iowa, the House Committee investigating Judge Hayes, charged with rendering decisions effectually nullifying the Prohibitory Law, reports that the charges are sustained, and recommends the censure of the Judge, and such other action as the House may deem best. .....Strikes of school boys for shorter hours and less work are becoming rather common. Five reported in different parts of New York and Pennsylvania, this week. Collapse in all cases, mostly owing to mothers formidable with slipper, or shingle, or the terrors of a dark closet, or a supperless early bed.....John H. Noyes, founder of the Oneida Community, near Utica, N. Y., died Monday. .....Fifteen State Commissioners were present at the 16th annual meeting of the American Fishery Association held at Chicago Monday.....A Senate bill raises the salaries of U. S. District Judges from $3,500 to $4,000. The 12 Police Justices of this city, petty lawyers or third-rate politicians, get $8,000 a year apiece. ..Collector of the Port Hager, of San Francisco, says the new Chinese Minister was not insulted. He wasn't allowed to land, however, till his credentials were shown.....The House Committee on Territories, will report adversely all bills relating to the proposed Territory of Oklahama.....Chicago declines to be submerged even to gratify St. Louis, and declares the report that Lake Michigan is rising the folly of a would-be-funny nincompoop,.....The strike on the Gould system continues; but most of the trains are reported by Vice-President Hoxie to be running regularly, and carrying all the freight offered. Letter-writing and mutual reciminations between Gould and Powderly, with much good sense on the side of the latter, but a better style of argument on the side of the former—a 100-millionaire can always command the best of logic, language and brains. The K. of L. everywhere and other labor organizations are preparing to systematically support the strikers with contributions, the sums now aggregating about $2,500 a day. Hoxie has refused an opportunity of arbitration offered by the merchants and other citizens of St. Louis. In spite of all talk, the strike appears to be a failure It has done much injury to the *prestige* of the K. of L. and to the trade, manufacture and agriculture of a large part of the country; but a gigantic struggle for a fairer adjustment of the relations of Labor and Capital is inevitable, and this seems the beginning. Occasional acts of violence here and there; no great out-breaks. Other strikes quite numerous in all parts of the country against reductions in wages, or for higher wages, or shorter hours for the same or even higher wages, and also through sympathy or a desire to help other strikers in the same line, or to compel the discharge of obnoxious foremen or non-union operatives, or for various other causes. Mutterings still heard of a vast strike in May for a "work day" of eight hours. The general public seems to be getting a trifle tired of so many strikes on all sides; and especially of the multitude of boycottings and their attendant parades, remonstrances, threats and denunciations..... Friday the Dominion Government was sustained by Parliament in its management of the Northwest rebellion, the vote of censure pressed against it being lost by a decisive majority.....The Massachusetts House of Representatives divides 77 for and 128 against the bill allowing women to vote in municipal elections.....A strong Mormon lobby at Washington and the peaceful slumbers of the anti-Mormon bill in the House Committee on the Judiciary, lead some to fear that it is a violent case of cause and effect..... John Welsh, Ex-Minister to England, and head of the Centennial Exposition at Philadelphia, died in that city last Saturday..... The average indebtedness of Canada is nearly $58 per head, which is more than twice the per capita of the indebtedness of the United States.....The Cigarette Act has just been published in Massachusetts, and whoever, not being a parent or guardian, gives tobacco or snuff to persons in that State under 16, or whoever sells the same to persons under 16 is liable to a fine of $50..... Gross mismanagement of Soldiers' Orphans' Schools of Penn., in the interests of an unscrupulous, atrociously cruel "ring," has for some days been under investigation, and as a result Gov. Pattison, on Thursday, demanded the resignation of the Rev. R. E. Higbee, State Superintendent of Public Instruction, whose neglect of duty permitted the atrocities to continue so long. He also summarily removed Rev. J. W. Sayres, male Inspector of Soldiers' Orphans' Schools, and Mrs. E. E. Hutter, female Assistant Inspector. The testimony, he says, "shows a most pitiful, cruel and inhuman neglect of the children; a want of the commonest necessaries of decent living, and insufficient moral and religious training. A sadder or more shameful story of deliberate human cruelty could not be exhibited." The rascals starved the little orphans and stuffed their own pockets with the money that should have filled the stomachs of their charges.

AFTER two years' trial, we unhesitatingly pronounce the Boss ZINC and LEATHER COLLAR PAD, the only durable and successful one that we have ever used. It retains its shape, is cooling, prevents chafing, and thereby keeps the horses' necks clean and healthy. HIRAM G. DODGE & SONS, Wood & Coal Dealers, Madison, Wis.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, April 17, 1886.

RECENT exposures of enormous frauds under the Pre-emption, Timber-culture and Desert Land Laws have aroused a great deal of indignation against the legislation which made them possible, and unlimited distrust of the official machinery which permitted or aided them. It is, therefore, proposed by the Public Lands Committee to abolish all three laws by one Act. If the extent and flagrance of the frauds were fully known to the public, the demand for some prohibitive and punitive legislation would be so loud all over the land as to drown the clamorous remonstrances of the conscienceless land-grabbers and their tools, as well as the feeble complaints of the few honest settlers who might be injured thereby.....The House Committee on Commerce has agreed to report Congressman Dunham's bill to provide for the inspection of live stock, dressed meats, hog products and other purposes. Mr. Dunham represents the Chicago meat-handling trade in this measure, and probably hopes to do something to restore our pork products to good standing in Germany and our live stock to admission to Great Britain. The bill provides for inspectors, and punishes severely the importation of adulterated articles of food or drink. It is said that it lacks provisions for penalties upon the manufacture of adulterated or unwholesome food for exportation..... France proposes to raise the duty on foreign maize.....According to the February report of the Department of Agriculture the number of horses has increased from 11,564,-572 head, in the United States in 1885 to 12,-077,656 head in 1886, an increase of 513,-085 head. The average value was given last year at $73.70 per head, while this year it is given as $71.29 per head, a decrease in value of $2.43 per head, or about three per cent. Mules have decreased from $82.38 to $79.66 per head, about the same percentage as horses. Prices of horses range higher in New Jersey than in any other State, where the average value is given as $118.17. The next highest is given in Pennsylvania, where it is $117.33. In Ohio the average value is placed at $100.80..... "N. Y. parties" are prosecuting the "Produce Dairy Company," manufacturers of butterine in Providence, R. I., for royalty of one cent a pound on the stuff they are turning out. Who can prosecute the concern for the misrepresentation in its name and the fraud in its goods?.....Thirteen million sheep are said to have died in New South Wales within the last three years for want of water..... The soil of Northern Virginia, upon which occurred so many battles, is now so poor that it does not furnish pasturage, and cattle raising there has been abandoned..... The April Report of the Dept. of Ag. shows an increase in the prevalence of hog cholera and a loss of 6,000,000 of swine from all causes, or 14 per cent. The losses of sheep are reported at seven per cent.: of cattle four per cent. The losses of horses are small, only seven-tenths of one per cent. Losses of cattle are heaviest in the Southern States and on the ranges, from four to eight per cent., while in the farm regions, where shelter is provided, the loss is only two per cent..... .....Since January 1st, Chicago has been shipping eastward nearly 50,000 hogs a week, mostly for consumption.....Auction sales of cattle promise to be unusually numerous, heavy and important this Spring.....The number of horned cattle in Illinois last year was 2,166,059, the number marketed 497,586, the average live weight 1,101 pounds, and the average price $3.95 per 100 pounds. The assessed number of hogs was 3,858,030, the number marketed 3,202,145, the average weight 239 pounds, and the average price $3.50 per 100 pounds.....Out of a cargo of 65 full-grown ostriches recently shipped from Africa to California, only 36 survived the passage Ostrich farming has been so overdone in South Africa, that several of the largest "farmers" have burst up, and others are making little or nothing. Feathers low; birds selling for less than one-fourth of their price four years ago..... ..The following are the officers elected at the first National Sheep-shearing and Wool-Growers' Convention held at St. Louis, Mo., the other day:—President, Columbus Delano, Ohio; Secretary, C. D. N. Campbell, St. Louis; Treasurer, C. W. Simmons, St. Louis, with Vice-Presidents representing nearly all the States in the Union.....The Prussian Minister of Agriculture says the Government does not at present think it expedient to increase the import duties on grain and cattle; and that imposts on wool are out of the question. The agricultural distress is as great, he says, all over the Continent as in Germany.....The importation of French wines into England is enormous, owing to the expectation that the Government, in their forthcoming budget, will propose an increase in the duties on wines.....

The Throat.—"*Brown's Bronchial Troches*" act directly on the organs of the voice. They have an extraordinary effect in all disorders of the throat.—*Adv.*

Crops & Markets.

SATURDAY, April 17, 1886.

THE Department of Agriculture's report for April makes a reduction of winter wheat area of 3,500,000 acres from the breadth seeded two years ago, and five per cent. reduction from the area seeded a year ago. On the Atlantic coast there has been very slight reduction, and none on the Pacific coast. The largest decrease is in Illinois, Kansas and Missouri. Comparative areas seeded in principal States are: New York, 97; Pennsylvania, 98; Ohio, 99; Kentucky, 95; Michigan, 99; Indiana, 95; Illinois, 85: Missouri, 92; Kansas, 84; California, 99; Oregon, 103. In comparison with the breadth *harvested* last year, there is an increase. A moderate degree of protection by snow has been enjoyed, though the covering has been neither heavy nor continuous. Winds have laid bare exposed surfaces and covered valleys deeper. Winter-killing in patches is therefore reported to some extent, while it is generally found that brown and apparently lifeless plants have roots uninjured. The general average of condition is 92½, against 76 last year (the lowest ever reported) and 94 two years ago. The average of 1883 was 80, and that of 1881 was 88. Condition of States is as follows: New York, 98; Pennsylvania, 99; Ohio, 94; Michigan, 93; Indiana, 96; Illinois, 86; Missouri, 94; Kansas, 88, and California 100. The condition of the soil for autumn seeding was favorable in four-fifths of all counties. The exceptions are more frequent in districts of small production. In the Ohio Valley and in the Middle States the seed-bed was in good condition in nine-tenths of the area. In Missouri and Kansas there was a larger proportion of dry areas, and one-fifth of the reports were unfavorable. In Virginia and the Carolinas, one-sixth of the area seeded was not in good condition; in Georgia, one-third; in Texas, three-tenths. In at least five-sixths of the entire breadth of winter wheat, the condition of soil was favorable for seeding, germination and early growth. Damage to wheat by the Hessian fly is indicated in scarcely one county in twenty in the winter wheat. The presence is deemed worthy of mention in 16 counties of Indiana and eight of Illinois. In Ohio, Indiana, and Michigan, and also in Pennsylvania and New York, it is respectively reported in four to six counties. The damage has not been serious.

The wheat market has been heavy, with good weather at the West and an unwillingness on the part of the United Kingdom and France to buy in advance of requirements, in spite of the many calculations that Indian and Russian surpluses are low, and that exports from the United States prior to August 1 must materially exceed those in the first quarter of the year. Cash wheat, No. 2 Red, at New York, advanced 1½c. in the week. Wheat clearances from the Atlantic ports this week promise to aggregate nearly one million bushels, or double late averages. Ocean freights are lower for grain. The strike at the West so prevented shipments hither that rates went off to get freight.

The fruit stands and markets are red with Baldwin apples. There are some Russets and Greenings, but the Baldwin is decidedly the favorite. Apples have shown very little increase in price since January; at present they are cheaper than in any year since 1881. The quality is reported excellent and the fruit is in good condition. Reports from Western New York say apples are exceedingly low-priced. In Alleghany Co., Pa., Baldwins are reported to have been sold the other day at public sale for one cent per bushel!

Heavy receipts of butter and a light export demand for cheese have induced concessions in prices of those products.

Wool market inactive and weak. What with large receipts of foreign wool and the anticipated arrival of a new clip, most manufacturers are disposed to wait for something to turn up. Arrivals of California spring wool are looked forward to in the Eastern markets, and buyers are already off for Texas. Low and medium grades are relatively firmer than finer sorts, the latter being considerably depressed. Present condition of market less satisfactory than one year ago. The new clip in California appears to be of good quality. Very little interest is taken in the tariff discussion, inasmuch as the trade is generally agreed that there is small prospect for legislation this Spring. No one expects the Morrison-Hewitt bill to pass the Republican Senate, should it even pass the Democratic House, in which a considerable minority of the Democrats are protectionists.

The market for Western tobacco was dull during the week, and the total sales were only 150 hogsheads, of which 100 hogsheads were for export. A more hopeful feeling prevails in the trade owing to the proximity of the time when the foreign contracts are awarded. In many of the tobacco-growing sections the low prices for the weed and the continued competition with Sumatra tobacco have a discouraging effect, and other crops will be substituted by a considerable number; but it is likely enough new ground will be planted to make good this falling off. Prices in Lancaster Co., Pa., are barely remunerative. Farmers have all prepared their seed-beds. The favorite variety will again be Havana seed, but an increased amount of seed leaf will be put out. Leaf tobacco at Louisville is easy to weak for grades. The weather is favorable for handling tobacco and also very favorable for plant beds. Tobacco at St. Louis is in improved demand, but transactions are light because of deficient offerings.

MARKETS BY TELEGRAPH.

SATURDAY, April 17, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 3c. higher; No. 2 Spring, 4c. higher. Corn, 3½c. higher. Oats, ⅝c. higher. Pork, 15c. lower. Cattle, steady or a decline for poorer sorts: an advance for superior animals. Hogs, a shade lower. Lambs steady. Sheep, from 10c. to 50c. higher.

WHEAT.—Strong; sales ranged: April, 75½@76¼c; May, 76¾@78¼c; June, 78½@80⅝c; No. 2 Spring, 76¾@77c. CORN.—Firm; Cash, 36¼@36⅜c; April, 36⅛@36⅜c; May, 37¼@37⅝c; June, at 37¾@38c. OATS—Sales ranged: Cash, 25¾@25⅞c; April, 25¾c; May, 29⅛@29⅝c. RYE.—No. 2, 60c. BARLEY—No 2, at 60c. MESS PORK.—Cash, $9 05@9 10; May, at $9 05@9 17½; June at $9 10@9 27½. LARD.—Quiet and higher; sales ranged; Cash, at $5 85@5 87½; May, $5 85@5 90; June, $7 02½@7 05. BULK-MEATS.—Shoulders, $4 00@4 10; Short rib sides, at $5 17½@5 20; Short Clear sides, at $5 55@5 60. CATTLE—Market lower. Shipping steers, at $4 00@6 25; stockers and feeders, $2 75@4 50; cows, bulls and mixed, at $1@4 00; bulk, at $2 50@3 00. HOGS.—Market lower; Rough and mixed, $4 00@4 30; packing and shipping, at $4 20@4 40; light, at $3 45@4 30; skips, at $2 90@3 75. SHEEP.—Market steady; Natives, $2 50@6 00; Western, $4 50@5 50; lambs, $4 85@6 12; Texans, $3 50@4 25.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 Red wheat is 2½c. higher. Corn, steady. Oats, steady. Pork, 40c. lower.

WHEAT.—Active; sales ranged; No. 2 Red, Cash, and April, 87¼c; May, 87¾@87⅞c; June, 87¾c. CORN.—Firm; No. 2 mixed, Cash, 33¼@33½c; April, 33¼c; May, 33½c. OATS—Dull; No. 2 mixed, Cash, at 29½@29⅝c; April, at 29½c; May, at 30¼c. RYE—Weak at 56c. BARLEY—American, 60@80c. BUTTER—Quiet; creamery, 25@30c; dairy, 20@25c. EGGS—Firm at 9½c. FLAXSEED at $1 02@1 03. HAY—Steady. Timothy, $11@11; Prairie, $6@8. BRAN, 58½c. PORK, $9 60. BULK MEATS.—Long Clear, $5 20; Short Rib, at $5 30; Short Clear, $5 50. LARD.—Steady at $5 75@5 80c. CATTLE—Market active; fair to choice native shipping steers, at $4 10@4 50; butcher steers, $3 50@4 40; cows and heifers, at $2 50@3 75; stockers and feeders, $3 00@4 15. HOGS.—Light, $3 85@4 00; packing, $3 85@4 00; heavy, $4 10@4 25. SHEEP.—Market steady at $3 50@5 75.

BOSTON.—CORN.—Steamer Yellow, at 50½c; do.

mixed at 50c. per bushel. OATS.—Firm. No. 2 white, at 42c,; No. 3 white, at 41c., and barley oats at 44@45c. Small sales of Rye at 67@68c, ₱ bushel. Bran is firm at $15 75 for Spring and $17 00 for Winter; fine feed and middlings at $16 00@19 00, and cotton seed meal at $23 25 on spot and $22 25 per ton to arrive. HAY AND STRAW.—Hay at $13 50@19 00 ₱ ton for choice and fancy; fair to good, $17@18, fine, $15@17, and $13@15 for poor and damaged, Western choice $16 @17, do fair to good $14@15. Rye straw $19 00@20 00 for choice, and $12@14 for common to good. Swale hay, $11@12; Oat straw, $9@10 per ton. PRODUCE.—BUTTER.—Northern creamery, choice to extra fall, 30@32c; good to choice summer, 18@22c; western creamery, at 32@33c, for choice to extra fresh made: good to choice held stock, at 15@18c; northern dairy, 28@30c, for Vermont extra; 20@23c, choice, and 15@ 18c, for fair to good; Western dairy, 18@23c, for choice, and 13@15c, for fair to good; imitation creamery at 25@28c, for good to extra; ladle-packed, at 24@25c, for extra. CHEESE—New York choice to extra, 9½@11c. and common to good, 5@8c; Vermont choice to extra, 9@11c, and common, 5@8c; Western choice to extra, at 8@10c. Skims, extra, 13½c, good to choice, 9½@10½c. EGGS—Cape and near-by, ₱ dozen, at 14½c; Eastern extras, at 13¾@14c; do. firsts, at 13c; Northern, fresh, at 13½c; Western fresh, at 13c; Provincial, at 13c. BEANS.—Choice Northern hand-picked pea, at $1 65@1 70 per bushel; do, do, New York, small, $1 45@1 50; do, do, screened, $1 15@1 30; medium choice, hand-picked $1 20@1 35; do, do, screened, at $1 15@1 30; Yellow Eyes, improved, at $1 35; do, choice flats, $1 30@1 35; Red Kidneys, $1 65@1 70. Canada peas, 65@95c, per bushel for common to choice. Green peas, Northern, at 90c@$1 00; do, Western, $1 20@1 25. Potatoes range at 45@70c, per bushel, as to quality.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 17, 1886.

STATE OF THE MARKET.—Compared with cash prices last week, flour is steady; Ungraded Winter Red, 5c. lower; corn, ½c. higher; oats, 1c, higher; pork, unchanged; butter, a shade lower; eggs, steady; fruit, a trifle higher; potatoes, steady.

FLOUR, FEED AND MEAL. FLOUR—Quotations: Fine at $2 20@3 00; Superfine, $2 80@3 35; Extra No. 2, $3 15@ 3 55; Good to Fancy Extra State, $3 70@4 25; Common to Good Extra Western, at $3 15@4 00; Good to Choice Extra Western, $4 00@5 10; Common to Fair Extra Ohio, $3 15@3 75; Good, $3 80@4 20; Good to Choice, $4 25@5 00; Common Extra Minnesota, $3 15@ 3 50; Clear, $3 60@4 20; Rye Mixture, $3 50@4 00; Straight, $4 25@4 75; Patent $4 50@5 10; Bakers' Extra, $4 00@4 75; St. Louis Common to Fair Extra, $3 15@ 3 75; Fair to Good, $3 80@4 75; Good to Very Choice, $4 90@5 00; Patent Winter Wheat Extra, $4 35@5 15; City Mill Extra for West Indies, at $4 60@4 75; South American, $4 70@4 85. SOUTHERN FLOUR—Common to Fair Extra, $3 30@3 65; Fair to Choice do., $3 90@5 25. RYE FLOUR.—Superfine, $3 25@3 45. CORN MEAL.—Yellow Western at $2 60@2 85; Brandywine at $2 80 @2 85. FEED—40 to 50 lbs. quoted at 80c.; for 60 ℔. at 70@72½c.; 80 ℔. at 70@75c.; 100 ℔. at 75@80c.; and sharps at 85@ 90c. Rye at 80c.

GRAIN.—WHEAT.—Ungraded Winter Red quoted at 81@81c.; No. 2 Red at 93½c; No. 1 Northern, at 95c.; No. 2 Red for April, at 909½c; do. for May, at 913/16@91½c.; do. for June, at 913/16@913/16c.; do. for July, 913/16@91½c; do. for August, 915/16@92½c; do. for September, at 935/16@93c, do. for October, at 935/16@91c; do. for December, 963/16@963/16c. RYE—Western, 60c@62½c; Canada at 63@64c; State at 65@66c. CORN—Ungraded Mixed, at 41½@44c; Rejected at 41c; No. 3, 45@45½c.; Steamer Mixed, 45@45½c; No. 2, at 45½c; No. 2 White, 47c; No. 2 Mixed for April, 45½c; do. for May, 46@46½c.; do, for June, 46¾@46¾c; do. for July, 47c. OATS—No. 3 Mixed, 36½c; No. 2, 37c; No. 3 White, 41c; No. 2 do. 42c; No. 1, nominal, 45c; Mixed Western, at 37@39c.; White do., at 40@46½c; White State, 44½c.; No. 2 Mixed for May, 36c.; do. for June, 35½c.

PROVISIONS.—PORK.—Mess quoted at $9 50@10 00 for Old and $10 50@10 75 for New; $10 75@11 50 for Family Mess; $12 00@14 00 for Clear Back; and $9 50@9 75 for Extra Prime. BEEF.—City Extra India Mess, at $15@17; Extra Mess, in barrels, $8 00@8 50; Packet, $8 50@9 00 in bbls.; Fancy Plate, $9 00. BEEF HAMS.—Quoted at $18 50. CUT MEATS.—Rib Bellies, 12 ℔. average, 5½c; Pickled Hams at 8¾@9c.; Pickled Bellies, 10 ℔. average, 5½c; do. 10 ℔ average, at 5½c; Pickled Shoulders quoted at 4½@4¾c; Smoked Shoulders, 5@5½c; Pickled Hams, 8¼@8½c; Smoked do., 9½c. MIDDLES—Long Clear in New York, 5¾c.; at the West, Long Clear, 5.35c; Short Clear, 5.60c. DRESSED HOGS.—City Heavy to Light, 5¾c; Pigs, 5¾@6c. LARD.—Western Steam, 6.17½@6.20c; April, at 6.18c.; May, at 6.18@6.18c.; June, at 6.19@6.20c; July, at 6.20c.; August, 6.32@6.33c; September, at 6.37c.; October, 6.44@6.45c; City Steam, 6.05c; Refined quoted Continent 6.40c.

BUTTER.—Elgin Creamery, at 33c; Pennsylvania do., 32@33c.; Western do., 26@32c.; State Dairy half-firkin tubs, 24@30c.; Welsh tubs, 26@29c; Western Imitation Creamery, 18@20c; Western Dairy, 15@18c; do. Factory, 15@21c.; rolls, 8@12c. Old Butter.—State Dairy, 15@26c; State Dairies, firkin and tubs, 12@25c; State Dairy, firkins, 16@23c,

CHEESE.—State, at 9@11¼c; Skims, 2@8¾c.; Western, 8½@10½c.

EGGS.—State, at 13c.; Western, at 12¾c.; Southern at 12¼@12¾c.

POULTRY.—LIVE.—Fowls, near-by lots, per ℔, at, 15@16c.; fowls, Western, per ℔, at 14@15c.; fowls, Southern lots, per ℔, at 14c; turkeys, per ℔, at 12@14c.; ducks, western, per pair, at 70c.@$1.00; geese, western, per pair, at $1..75@2.00.

POULTRY.—DRESSED.—Turkeys, per pound, 11@13c.; chickens, Philadelphia, light weights to pair, 40@50c. per ℔; do. winter, Philadelphia, 25@28c.; fowls, Pennsylvania, prime, 14c.; do. Jersey, at 14c.; do State and western, at 13½@14c. Ducks, Jersey, per ℔, 14@ 15c; do. western, 13@14c. Geese, Jersey, at 10@12c; do. western, at 9@10c.

POULTRY.—FROZEN.—Turkeys, per pound, at 13@15c.; Chickens, per pound, at 5@12c.; Ducks, per pound, 14@ 15c.; Geese, per pound, at 10@12c.

GAME.—Wild ducks, canvas, per pair, 75c@$1 50; do. red-head, per pair, at 75c@$1 00; do. mallard, western per pair, at 30@40c.; do. teal, 20@30c; do. widgeon, 20 @40c; English snipe, per doz., $2 50; Plover, Western, per doz., $1 75@2 00.

COTTON.—The quotations, according to the American classification, are as follows:

	Uplands.	New Orleans and Gulf.	Texas.
Ordinary	6⅞	6 13-16	6 3-16
Strict Ordinary	7 1-16	7¼	7¼

VEGETABLES.—Potatoes.—Maine, fancy, d. h. bbl. at $2 25; Nova Scotia per bbl., at $2 00@2 25; State, per 180 ℔., $1 50@1 75; Burbank, State, bulk, per 180 ℔, $1 62@1 87; Burbank, eastern and Nova Scotia, per bbl, $2 25@2 50; Hebron, do, do, do, per bbl, $2@2 25; Hebron, State, bulk, per 180 ℔, $1 50@1 75; Prolific and Goodrich, eastern and Nova Scotia, per bbl., $2 00@ 2 25; Peerless, bulk, per bbl., at $1 50@1 75; Magnum Bonum, imported, 168 ℔. sack, $1 80@2 00; Bermuda, per bbl., at $18 00. Sweet potatoes, Delaware River, per bbl., at $2 50@3 00. Cabbages—Long Island, choice, per 100, at $6@7.

LIVE STOCK MARKET.

NEW YORK, SATURDAY, April 17, 1886.

BEEVES.—Total shipments for the week, 9,840, against 7,947 head for the same time last week. Very Ordinary to Choice Steers, sold at the range of $4 75@6 25 per 100 pounds, and four cars of Extra Bullocks bought in Chicago, cost laid down here about $6 50. Dry Cows sold at $3 50@4 50 (including four cars of still-fed sold mainly at $4 25@4 50). Bulls ranged from $3 50 to 4 50; and Old Oxen from $4 60 to 5 60, Chicago steers, 1,458 ℔, at $6 25; do, 1,226 ℔, at $5 85; do., 1,176 ℔, at $5 70; do, 1,144 ℔, at $5 65; Ohio do, 1,955 ℔, at $6 25; do. 1,296 ℔, at $5 88; do, 1,158 ℔, $5 85; Cincinnati do., 1,084 ℔, at $5 50; do, 1,125 ℔, at $5 50; Indiana do, 1,297 ℔, at $5 88; Kentucky do, 1,199 ℔, at $5 57½; Ox, 1,570 ℔, at $4 60; do, 1,615 ℔, at $5 60; Bulls, 1,360 ℔, at $4 50; do, 1,380 ℔ at $3 50. Pennsylvania Stable-fed Steers, 1,339 ℔, at $5 85; do, 1,235 ℔, at $5 65; do, 1,174 ℔, at $5 60; Ohio steers, 1,180 ℔, at $5 40; do, 1,412 ℔, at $5 95; State do, 948 ℔. at $4 75; Mixed Western steers, 1,539 ℔, at $6 10; do, 1,378 ℔, at $5 88; do, 1,362 ℔, at $5 70; do, 1,127 ℔, at $5 36¼; do, 1,042 ℔, at $5 22½; State do, 1,092 ℔, at $5 15; do, 1,004 ℔, at $5.

CALVES.—Veals, 108 ℔, at 4½c; 105 ℔, at 6c; 141 ℔, at 6¼c.

SHEEP AND LAMBS.—Total receipts for six days, 28,970 head against 22,423 head for the same time last week. The market ruled dull and trade was limited with prices barely steady. Poor to Prime Unshorn sheep sold at $4 15@6 75, with a car-load of Extra Heavy Wethers, bringing $7 37½. Yearling lambs sold at 6¼@8c, per pound.

HOGS.—Total receipts for six days, 35,392 head, against 28,897 head for the corresponding time last week. None alive for sale. Nominally steady at $4 60@4 85 per 100 ℔.

AN ANNOYING and perplexing loss of memory even of ordinary things indicates, in general, impoverishment of the blood and consequent failure of the brain. This impoverishment is caused by the excess of uric acid in the blood, which can be neutralized and removed by Warner's safe cure only.

PRODUCE COMMISSION HOUSE
ESTABLISHED 1865.
S. H. & E. H. FROST,
100 PARK PLACE, N. Y.
Shippers desiring to favor us will be furnished stencils, shipping cards, etc., on application. Promptness guaranteed. References, RURAL NEW-YORKER, Irving National Bank, etc.

To the Kainit Trade.
ROBERT S. CARR,
Admiralit Ætstrasse 52.
TELEGRAMM-ADDRESSE.....ROBERT CARR.
HAMBURG, 1st of January, 1886.
The undersigned has the honor to inform all those interested in the KAINIT TRADE that he has been appointed by the STASSFURT SYNDICATE OF KAINIT WORKS, consisting of KÖNIGLICH PREUSSISCHES SALZWERK, STASSFURT, (The Royal Prussian Saltmine); HERZOGL. ANHALT. SALZWERK, LEOPOLDSHALL, (The Ducal Anhalt Saltmine); SALZBERGWERK NEU-STASSFURT, LOEDERBURG, (The Saltmine New Stassfurt); KALIWERKE ASCHERSLEBEN, GEWERKSCHAFT, ASCHERSLEBEN, (The Kaliworks Aschersleben), as their SOLE AGENT for the sale of this article to the United States of North America and Canada. As such, any orders will be carefully and promptly executed at the shortest notice and lowest possible current cost.
The demand for Kainit is steadily increasing, and the agricultural public, in becoming more acquainted therewith, is rapidly realizing the fact that the small cost of the article (it is the cheapest article for agricultural purposes) compares favorably with the results arrived at. As a standard Kainit is guaranteed to contain no less than 23 per cent. Sulphate of Potash and assuring all importers of the greatest care in executing orders entrusted to the undersigned, he is always ready to quote by cable or letter in reply to inquiries made direct or through his agents. Representatives for Baltimore; Messrs. PRIOR & VON COLLEN, 25 S. Gay Street, Baltimore. ROBERT S. CARR.

PENGUIN ISLAND GUANO.

A Pure, Natural Guano. The best fertilizer for wheat and general crops. Price $25 per ton, delivered at railroad in New York, in bags. The Massachusetts Agricultural Experiment Station gives its actual value at $31.62. All Stations find value above its cost. "Sulphate of Potash and Kainit at lowest prices. Send for circular to"

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.

AS AN EVIDENCE OF FAITH

in my remedy I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.
1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.
2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.

Facts are Better than Assertions.

Please read the following testimony:
GIBSONTON P. O., PA., Feb. 2, 1885.
Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*
Yours very truly, WHITE & CO.
[N. B.—White & Co., since writing the above letter, have purchased $450 worth of the remedy.]
The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

Agents will be supplied with canvassing outfit on application.

Entered at the Post-office at New York City, N. Y. as second-class mail matter.

For the Young.

OW many of the Cousins have ever seen the Mayflower or trailing arbutus? Not many, I fear, for it is only found throughout New England, along the coast, and along Lake Michigan and a few other places. To my mind, it is the most beautiful of all the spring flowers. It is such a modest little thing, and comes pushing its way up through the brown leaves just at the time when we need flowers and beautiful things. It comes crowding over the gray old hills of New England, filling the air with the most beautiful perfume. No hot-house flower raised with all the skill that art can ever bestow can compare with this sweet little wanderer. It was the first flower that the Puritans saw after that long and terrible Winter at Plymouth. It must have been very dear to them, hard and stern though they were. I have seen some pretty rough men that you never would think capable of showing any feeling, pick Mayflowers and put them in their buttonholes. City people are very fond of these little wild flowers. The boys and girls in the country along the Old Colony Railroad make considerable money every Spring at picking Mayflowers for the Boston florists. Uncle Mark used to do this work himself years ago. It was far more profitable than picking huckleberries. We would gather the flowers in great baskets and bring them home, when the girls would make them up into small bunches. The girls could always beat the boys at this work, and we were glad enough to admit it. In the morning, we would send great boxes of these bunches of fragrance up to Boston, where they would gladden the hearts of the city people for many a day. I often think that some of the best hours of my boyhood were passed on those gray old hills hunting for Mayflowers. I wish all the Cousins could see them.

On the dreary fields of the cold, bleak North,
Where the snow lies long on the barren hills,
You fill all the air with a perfume rare
Like a breath from Heaven—a touch that thrills.

You come with smiles though the fields are dead
And the barren hillside broods and grieves,
From the hills of gray that look far away
O'er the sea, you gladden the dead brown leaves.

The gloomy Puritan, years ago,
The soldier marching with sword in hand,
Passed smiling at you so tender and true,
With a feeling they never could understand.

You bring us back from the long ago,
A life we dropped as the stern years swung,
When life was new and as sweet as you,
And Care hung back with a palsied tongue.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK.—I would like to join the Y. H. C. I am a little girl, nine years old. My father takes the RURAL and we all like it very much, but I enjoy reading the letters the best. I have a little kitten; its name is Pinkey. It will play very nicely. I have six sisters and two brothers; I am the youngest of them all. I have five rabbits, three white ones, one black one, and a brown one. I like to crochet very much. I wish that the Cousins would send me some patterns. I have a dolly; her name is Maud. Well, I must stop, or my letter will be too long for print.

From your Niece,
Mayfield, N. Y. MATTIE KNAPP.

[Who can send the patterns? I wonder what color Pinkey can be? U. M.

DEAR UNCLE MARK: It is nearly a year since we wrote our last letter. Since then we have traded our farm for another of 110 acres. The Cedar River runs through it. There are quite a good many fish in it. The fish will soon begin to run and we will get some of them. They will be pickerel mostly. Pa is going to give John and I a quarter of an acre of ground for garden. I am going to plant some corn, potatoes, beans, onions, parsnip, radish, lettuce and cabbage. I am going to raise some cabbage plants to sell. Two years ago we sold a lot of plants. I will write and tell you how we succeed with our garden.

CLARENCE, JOHN and WILLIE CROOP.

[Pickerel are very good to eat. I hope you will have a good garden.—U. M.]

DEAR UNCLE MARK: I am a little girl, 13 years old. I live on a farm in Trempealeau Co., a mile and a half from town. I like living on a farm very much. We have a silo and make ensilage for the cattle, and Papa thinks it is worth double its cost for stock. I have a little pet dog; he is three years old, and his name is Cute. I did have two canaries, but they got away last Summer. Our farm is most too large; there are 520 acres. We have 50 hens, two dogs, 36 head of cattle, 65 pigs, and five horses. There are two railroads running through our farm. Oh! I almost forgot to ask you if I might join the Y. H. C.? but I won't make this letter too long, for if I do, you won't want me to write again. JESSIE MARSH.

[Yes, you are now a Cousin. Your farm is pretty large. I am glad the silo is such a success.—U. M.]

DEAR UNCLE MARK: I had two stands of bees of my own. They were very weak in the Spring, but had increased so by the middle of July, that I expected them to swarm, but they did not, and I swarmed them artificially by taking all the frames of comb and bees out, and shaking the bees down in front of the hive and letting them run in on empty combs. I then removed my other hive of bees to a new location, and placed an empty hive in its place. The returning bees entered the hive as they knew of no other place to go to. I neglected to say that I did this when the bees were hard at work. I then placed my combs from the other hive in the new hive and gave them a queen, I had before purchased. I then had another stand of bees. I obtained 205 pounds of honey from my bees, for which I received from 17½ to 15 cents a pound. I hope I am not crossed off the list of Cousins for not writing before. I will try to do better next time. Your affectionate Nephew,

HERBERT GREEN.

[Bee keeping is very nice and pleasant work. It requires a great deal of thought and study. The business has greatly changed in the time that has passed since I was a boy. I can remember that we used to have two or three old hives of bees standing on a platform out in the orchard. They never used to give us much honey. We used to blame them, but now I know it was our own fault. We did not give them comfortable quarters, or help them work. They would sting the cattle, or even the bad boys who used to steal our apples. One year we put them under the best apple tree, so that our fruit would be protected, and it surely was protected, for the bees were so savage that none of us dared to go and pick up apples, and we missed our apple sauce and baked apple. In the Spring when the bees swarmed, what a time there was! We would pound upon tin pans, and make all manner of noises until the swarm settled down upon a tree. Then the old man with whom I lived, with a great bundle of mosquito netting over his head, and great gloves on his hands, would cautiously place the empty hive under the great brown bunch of buzzing bees and strike the limb with his stick. Once each season he was sure to fall down while running away, and then the bees had him at their mercy. How they did sting him! I can remember how he used to look, after the battle, sitting in his arm chair in the kitchen, with his face and hands all swollen, telling how much better the bees were when he was a boy. So I never used to think much of bees when I was a boy. But I have changed my mind since I came to see how pleasant and profitable the work can be made by careful attention. I can go and stand right among them without any danger of being stung. There ought to be a few good hives on every farm, and the boys and girls could help father and mother, and make better men and women of themselves too, by learning how to care for bees. Honey is the healthiest and best of all sweet foods. I wish farmers would use three times as much of it as they now do. U. M.

DEAR UNCLE MARK AND COUSINS: I do not get much time to write or study, because my little sister Edith hinders me very much. When I sit down she gets up beside me and tries to help write too, and you know she don't help much: she is only two years old. She tries to do all kind of house-work and is so cute and cunning that we cannot be cross with her, so I go and play with her when she wants me to. I want Uncle Mark to send me some seeds, for Papa says we can have all the ground for a garden, and all the seeds we want to plant in it. Papa made me a birthday present of Uncle Tom's Cabin. When I am reading it I have to have my geography with me all the time to see where George and Eliza went to Canada, and Uncle Tom went to New Orleans. That institution of slavery was horrid, wasn't it? Glad we don't have it now. I never saw but one negro, but I have seen lots of Indians and a few Chinamen. Papa takes ten newspapers.

Como, Montana. CARRIE E. HARLAN.

[Of course you can't scold that little baby. I am glad you stop and play with her. I like Uncle Tom's Cabin. I am glad, indeed, that slavery has been abolished. Let us be careful that we do not form habits that will make slaves of us.—U. M.]

THE OLDEST METHODIST MINISTER IN PHILADELPHIA.

"I AM the youngest old man in New York" said the Hon. William E. Dodge, a short time before he died. Mr. Dodge was indeed one of the sprightliest of old gentlemen. He was as most men of fifty, although he was about seventy-five. Up to the time of his death, which came very suddenly, he was able to accomplish more work in a day than almost any of his partners or clerks could get through with.

In Philadelphia lives another "young old man," one of the most venerable of Methodist ministers. He is as active, as hearty and as cheery as was Mr. Dodge. He is the Rev. Anthony Atwood, honored and beloved not only by Methodists, but by good people of every persuasion. Mr. Atwood might pass for a man of about sixty, but he is eighty-five. About 15 years ago he told the writer that he hardly expected to do much more work, and that he thought a man of seventy might be considered to have rendered all the effective service he would be capable of. Yet, since that time Mr. Atwood has done more ministerial work than many a younger man has accomplished. Some years ago he had a partial stroke of paralysis, which for a while disturbed his general health. He also suffered from a bronchial difficulty which threatened to be serious. From both of these disabilities he has now entirely recovered. With his snow white hair in its ample fullness, and his clear and ruddy complexion, he is the picture of a model patriarch, both in health and good nature. Although it is some time since Mr. Atwood has been in pastoral charge of a church, he preaches frequently, and is regularly at the Green Street Methodist Episcopal Church on Communion Sundays, taking part in the sacramental service.

The writer recently called on this venerable clergyman at his home, No. 809 North Seventeenth street, Philadelphia, and found him as cheerful and vivacious as in former years.

"Well, Mr. Atwood, it looks like old times to see you looking so vigorous and hearty; but years do not seem to make you an old man; and you appear to enjoy quite as good health as most of the younger men."

"My health," said Mr. Atwood, "is all I can expect, considering my age, which is now close to eighty-five. Since the stroke of paralysis, which I had several years ago, I have not been able to preach with my former vigor. I find that I am not capable of a prolonged pulpit effort as of old. Words do not follow my thoughts as quickly as they used to. But with this exception I am about as well as I have been for many years."

"When I had that stroke of paralysis," continued Mr. Atwood, "I resorted to a treatment which I found had been of great value to many others who were similarly affected. I had for many years known Dr. Palen, of Messrs. Starkey & Palen, who have done so much good with their Compound Oxygen, and I consulted him in reference to my case. I took the treatment at the office, which was then in Girard street. At once I began to receive benefit. For some time I visited the office regularly and frequently. I took inhalations of the Oxygen until my health was so fully restored that I was in no further need. It gave me a new vitality, restored my general health, and put my whole system in renewed good order."

"You had some bronchial difficulty, did you not, Mr. Atwood?"

"Yes; I had an irritation in my throat which was quite troublesome, and threatened to be more so. I tried Compound Oxygen for this also, and was surprised not only to find the completeness of the relief it afforded me, but the readiness with which it acted. I procured a "Home Treatment" in order to cure this bronchial trouble at my leisure; supposing the irritation would be slow to go away, as it is in the case of many clergymen, who, after long years of pulpit service, are attacked with soreness of the vocal organs. But I had occasion to use only a small portion of what was contained in the "Treatment." My throat became so much better that I had no occasion again to resort to the use of Oxygen."

"And have you, since your recovery, had much occasion to use this remedy, Mr. Atwood?"

"Not a regular thing, at all; only at long intervals. Once in a while, if I need a general toning up of my system, I call at the new office of Drs. Starkey & Palen—which, by the way, is an exceedingly beautiful and convenient place—and I take a few inhalations. From this I always receive benefit and strength."

"You are, then, a firm believer in this method of treatment?"

"Yes, very, very firm. You may say that I most heartily and thoroughly approve the treatment and endorse Drs. Starkey & Palen as gentleman whom I have known for years, physicians of repute and ability, in whom I have entire confidence. They have done incalculable good with Compound Oxygen. I am glad that so many invalids have been brought to health by this means. I am glad, too, that people are becoming more generally acquainted with it."

The experience of Mr. Atwood is an evidence that the virtues of Compound Oxygen are not only for the advantage of the young and those in middle life. There are many other instances on record in which persons advanced in years have received, by means of this great vitalizer, renewal of health and prolongation of life. For further reference to these and for better acquaintance with the merits of Compound Oxygen write to DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., for their pamphlet-treatise, which will be freely mailed to any address.

WOMAN, do you suffer from painful periods? If so, it is wrong, and Warner's safe cure will, by restoring the delicate organs to their proper condition, soon remove it and give you health.

PILES. Instant relief. Final cure in 10 days, and never returns. No purge, no salve, no suppository. Sufferers will learn of a simple remedy, free, by addressing C. J. MASON, 78 Nassau Street, N. Y.

PERSONALS.

THE Presidency seems to "agree" with Cleveland; he has gained 42 pounds since entering the White House.

SEC. L. Q. C. LAMAR has gone to Macon, Ga., "they say" to marry Mrs. Holt, widow of Gen. Holt. They were engaged in their youth, *on dit*, but were parted by "some trivial cause."

"EX-PRESIDENT ARTHUR has been very ill; but not with Bright's disease, as reported. He is is rapidly improving, and hasn't lost much flesh"—in spite of the reports that he has lost 125 pounds. Authority—"An intimate friend" on Wednesday last.

SAID Senator Palmer, of Mich., last Wednesday in the Senate, "To-day half a dozen gentlemen in Wall St. could meet together, and, by a piece of financial jugglery, dictate the profits or losses of thousands of men and of many communities."

WEDNESDAY was the 76th birthday of Senator Morrill, of Vt, and a congratulatory reception at his home in Washington was attended by nearly all the Senators, Justices of the Supreme Court and many other prominent officials and private persons.

SENATOR HOWELL E. JACKSON, of Tennessee, has been nominated by the President, and and at once confirmed by the Senate as U. S. Judge of the Sixth Circuit to succeed the late Judge Barter: salary, $6,000. He has accepted, and resigned his seat in the Senate. The Bell Telepone case will be decided by him. He is said to favor neither side.

THE newspaper men seem bound to marry Pres. Cleveland—now to Miss Frances Folsom, of Buffalo, who is in Europe with her mother who has written to Buffalo friends about the engagement of her daughter to the President. Marriage to take place "quietly in the White House in June," according to a confidential letter from Miss F. herself to a lady friend who "must never, never tell!"

Miscellaneous Advertising.

HOT AND DRY SKIN, frequent chills and fever, burning patches upon the skin, scanty dark colored water which contains sand or mucous, indicate that the system has been attacked by extreme kidney disorder, which can only be cured by Warner' safe cure.

BRICK AND TILE MACHINERY AND CLAY CRUSHERS, BEST IN THE WORLD

Address J. W. PENFIELD & SON, Willoughby, O. P. O. Box 3

ECLIPSE POST HOLE DIGGER.

The Greatest LABOR-SAVING tool ever invented for digging holes in the ground. This machine works on a new principle, and is unlike anything in the market. It is neither an Auger nor a Plunger, but is driven in the ground with a driving rod, which works in a pipe similar to a telescope. We claim for this tool:

1st. That one man can dig from two to three hundred holes two feet in ordinary ground in one day.

2nd. That it will dig holes any size or depth required.

3d. That it will work successfully in very hard or rough ground where other diggers and augers will not work at all.

4th. You stand up straight while using it, consequently no back-breaking work is required.

It will pay you to send for descriptive circulars and prices to COLE & FLEMING, Manufacturers, Springfield, O.

Beats the WORLD.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

CORN AND TOBACCO.

SECOND YEAR'S USE OF MAPES ON SAME TOBACCO PIECE.

Probably Largest Yield of Tobacco (Seed Leaf) in Mass. or Conn.

8,114 *lbs. on less than three acres.—Cured well.—Quality good.—No stable manure used for seven years.—Havana leaf,* 1,500 *lbs. per acre on turf ground.*

THREE ACRES, HAVANA LEAF, SEASON 1884.—SEED LEAF, 1885.

RILEY MAYNARD, South Deerfield, Mass., December 22d, 1885, reports:

I send you my report on my tobacco raised with your fertilizer the second year.

Last year (1884) I raised Havana Leaf on about three acres of *turf* ground. I used the Mapes' Tobacco Manure (Conn. Brand). I used about fifty dollars worth per acre and got 1,600 lbs. Havana Leaf to the acre.

This year (1885) on the same piece I set out Seed Leaf and applied the same Conn. Brand (Mapes'), 5,400 lbs., on the three acres (less 15 rods). I set out twenty-one thousand plants, or 7,000 plants per acre.

The crop cured well. I finished stripping it yesterday (December 21st.) It weighed 8,114 lbs.—over four tons on less than three acres. This is, probably the largest yield in Mass. or Conn. If there be any other Fertilizer that can beat it, I want to know it. There has been no stable manure on the ground for seven years.

I sowed the fertilizer, Mapes' Complete Manure for Tobacco (Conn. Brand,) on broadcast, plowing-in one-half, and harrowed-in the other half. I used Phosphate in the hill.

ONE ACRE, TURF GROUND, HAVANA LEAF.

I also raised one acre of Havana on turf ground, using one ton of the Mapes' (Conn. Brand). I got 1,500 lbs. of fine tobacco.

More Corn at less than one-half the cost as compared with stable manure.

[Extract from *Our Country Home*, February, 1886, Greenfield, Mass.]

Stable Manure vs. Complete Chemical Manures.—Experiment at our Country Home Grounds.

Experiment A.—Corn—In a field of 3 acres of Pride of the North corn, 2 plats of ¼ acre each were marked off. Soil, light and sandy. No. 1 received an application of 1½ cords of stable manure, costing $8 per cord on the ground, or $12 for the ¼ acre. Product, 19 baskets sound, and 2¼ baskets soft corn, or 76 baskets sound and 9 baskets soft corn per acre. No. 2 received 200 lbs. Mapes' Corn Manure, costing $5.25 for ¼ acre. Product, 22½ baskets sound and 1¼ baskets soft corn, or 90 baskets sound, and 5 baskets soft corn per acre. The stable manure was spread broadcast and harrowed-in with a wheel-harrow, as was 100 lbs. of the Mapes Manure. The other hundred lbs. was sowed when the corn was one foot high and cultivated-in. In all other respects the treatment of the two plats was exactly alike. The corn on stable manure produced a little the heaviest fodder, while that on the Mapes' averaged one week earlier in ripening. Both plats withstood a severe drouth well; $21 worth of Mapes' produced 14 baskets more of sound corn than $48 worth of stable manure.

E. A. JAMES, Superintendent.

Mr. James reports: "The Mapes' Corn Manure gave us most satisfactory returns. We used it also on one acre in comparison with stable manure (also one acre), same quantities as above, with same difference in favor of the Mapes' Corn as in the above experiment.

Now is the time to Top Dress Grass Lands and Lawns, Fruit Trees, Strawberry Beds.

Send postal for pamphlet on Manures for Onions, Tomatoes, Melons, Corn, Corn Fodder, Hungarian Grass, Turnips, etc., etc.

COTTON EXCHANGE BUILDING, NEW YORK.

☞ Crops Increased! Labor Reduced!

Every farmer who does not already own a **Kemp Spreader** should immediately investigate its advantages. The entire pile goes much further when it is finely pulverized and evenly distributed so that each plant will get its share and not too much. The KEMP SPREADER does this better than is possible by hand, and discharges a load *inside of two minutes.* Our four-wheel Spreader reduces the draught one-third by the improved manner of attaching forward wheels; and for Strength and Durability it has reached a degree of perfection in manufacture whereby breaks seldom occur.

Thousands of these Spreaders are in use, and we can furnish good references in every State. Send for Illustrated Catalogue and Book of References. **KEMP & BURPEE MFG. CO., Syracuse, N. Y.**

Ensilage. Silo Governor Certificate.

The undersigned, having made and fed ensilage for several years, believing that we have arrived at certain and uniform success, offer to those who are in doubt the following

CERTIFICATE.

This certifies that we are making ensilage without heat or fermentation in air-tight silos, cutting the corn in ¼ to ¾ inch lengths, weighting 100 lbs. to the square foot, and with this pressure getting one foot or more of juice in the bottom of the silo. We remove the air from the silo by using Colcord's Silo Governor, which causes a heavy vertical with very little lateral pressure; we obtain as uniform results cold, moist, soft and pulpy ensilage of the natural color of the corn, without offensive odor, imparting no odor to the silo, barn, hands, or clothing, but often of a bright, sweet smell, and sometimes the odor of nice, dry, corn fodder. We feed an average of sixty pounds daily to each cow, and our cattle eat it all without any waste.

We regard Mr. Colcord's system as the true, if not the only true method of ensiloing green forage crops, and recommend it as sure, uniform, economical, and less troublesome than any other. By using this system with the Governor according to directions, any one may be sure of success with ensilage.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1892. NEW YORK, MAY 1, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Rural Topics.

Experiment Grounds of the Rural New-Yorker.

THE LAST OF THE POTATO REPORTS FOR THIS YEAR.

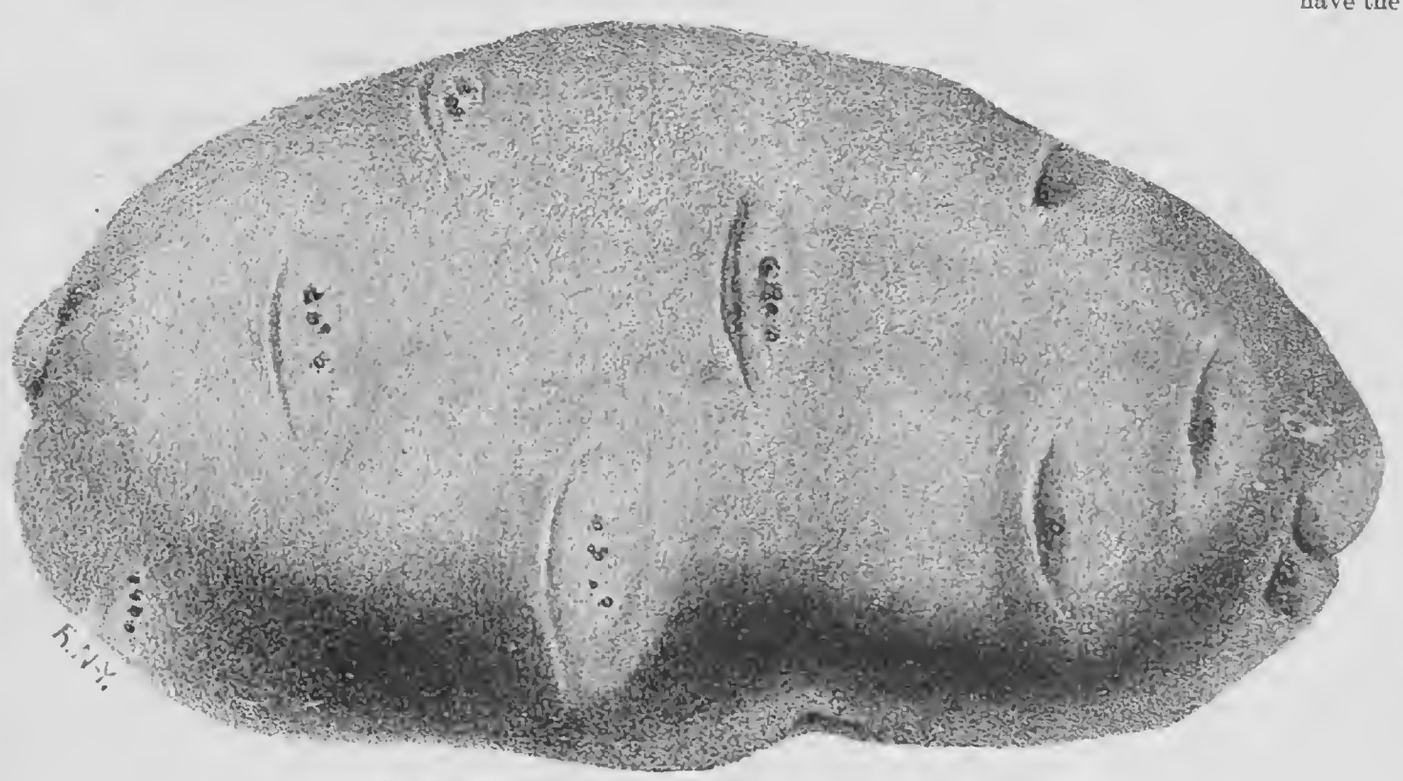
ELECTIVE, from Peter Henderson & Co.—The only note that we have is that it is earlier than Early Rose. It was overlooked in some way.

ECLIPSE, from O. H. Alexander, Charlotte, Vt.—Five pieces yielded nine pounds. Best five weighed 2 pounds 8 ounces; 31 tubers, 21 marketable. At the rate of 435.60 bushels to the acre. Reddish streaks in flesh. Irregular in shape, oblong. A bulky potato. Eyes medium as to number and prominence. Late. Eaten Dec. 2. White flesh, of only fair quality as to mealiness and flavor.

WHITE SWAN, from same.—Five pieces yielded 9¼ pounds; 22 tubers, 21 marketable, best five weighing four pounds—rate of 471.90 bushels per acre. Buff skin, shape cylindrical, medium-long, tapering at one end. Eyes rather deep. Eaten Nov. 17. Nearly white flesh. Not a first-class potato in quality.

GARLAND, from E. E. Stine, Cuyahoga Falls, Ohio.—"Seed from Early Rose. The best late potato," he writes. Two pieces yielded four pounds; 21 tubers, 10 marketable. Yield per acre, 484 bushels. Late. Straggle badly. The irregular shape, deep eyes and straggling habit condemn it.

SUMMIT, from same.—This gave us the largest yield of any potato tried last season. Mr. Stine says "It is the best early potato." Two pieces yielded 10 pounds; 21 tubers, 18 marketable. Best five weighed 4 pounds 11 ounces. At the rate of 1,210 bushels per acre. Fig. 175 shows the typical shape. Buff skin; eyes medium for so large a potato. Eaten Dec. 10. Fairly dry and mealy; white flesh. We find it rather a late potato.



SUMMIT POTATO. From Nature. Fig. 175.

ESSEX, from O. H. Alexander.—Five pieces yielded 10½ pounds—or at the rate of 508.20 per acre. There were 36 tubers, 22 marketable. Best five, 3 pounds 10 ounces. Long, pointed at both ends. Eyes few and not prominent. Eaten Dec. 29; white flesh, mealy. The shape kills it. Late.

MT. WASHINGTON, from same. Five pieces yielded 13½ pounds; 35 tubers, 29 marketable. Best five weighed 13½ ounces. Yield per acre, 653.40. Buff skin; eyes rather deep. Shape long cylindrical, flattened sometimes. Eaten Nov. 13. Flesh white and mealy outside, rather firm within. Perhaps they were not cooked enough. See Fig. 176.

ALBANY MARKET—Late. Yielded at the rate of 181.50 bushels per acre; 29 tubers, six only marketable.

DEW DROP, from O. H. Alexander.—Four pieces yielded nine pounds, or at the rate of 544.50 bushels to the acre; 44 tubers, 33 marketable. Eaten Oct. 12. Flesh nearly white, not dry. Eyes few.

SARATOGA, from same.—Five pieces yielded 8¼ pounds; 31 tubers, 20 marketable. This is at the rate of 399.30 bushels to the acre. Best five weighed 3 pounds 12 ounces; many very large. Shape broad, truncate at one end. Eyes rather deep. Skin buff. Most of them prongy, perhaps from the effect of drought. Not mealy or dry.

ANOTHER EXPERIMENT TO ASCERTAIN WHETHER THE SEED-END YIELDS AN EARLIER CROP THAN PIECES FROM OTHER PARTS.

TIPS.—Fifteen pieces of the tips or seed-ends of the Rural Calico yielded 32 pounds; 139 tuber 120 marketable. Best five weighed 2 pounds 10 ounces. Yield per acre, 516.27 bushels.

SEED from other parts—that is, the stem-end or middle. Fifteen pieces yielded 29 pounds; 124 tubers, 100 marketable. Best five weighed 2 pounds 13 ounces. Yield per acre 466.88 bushels.

REMARKS.

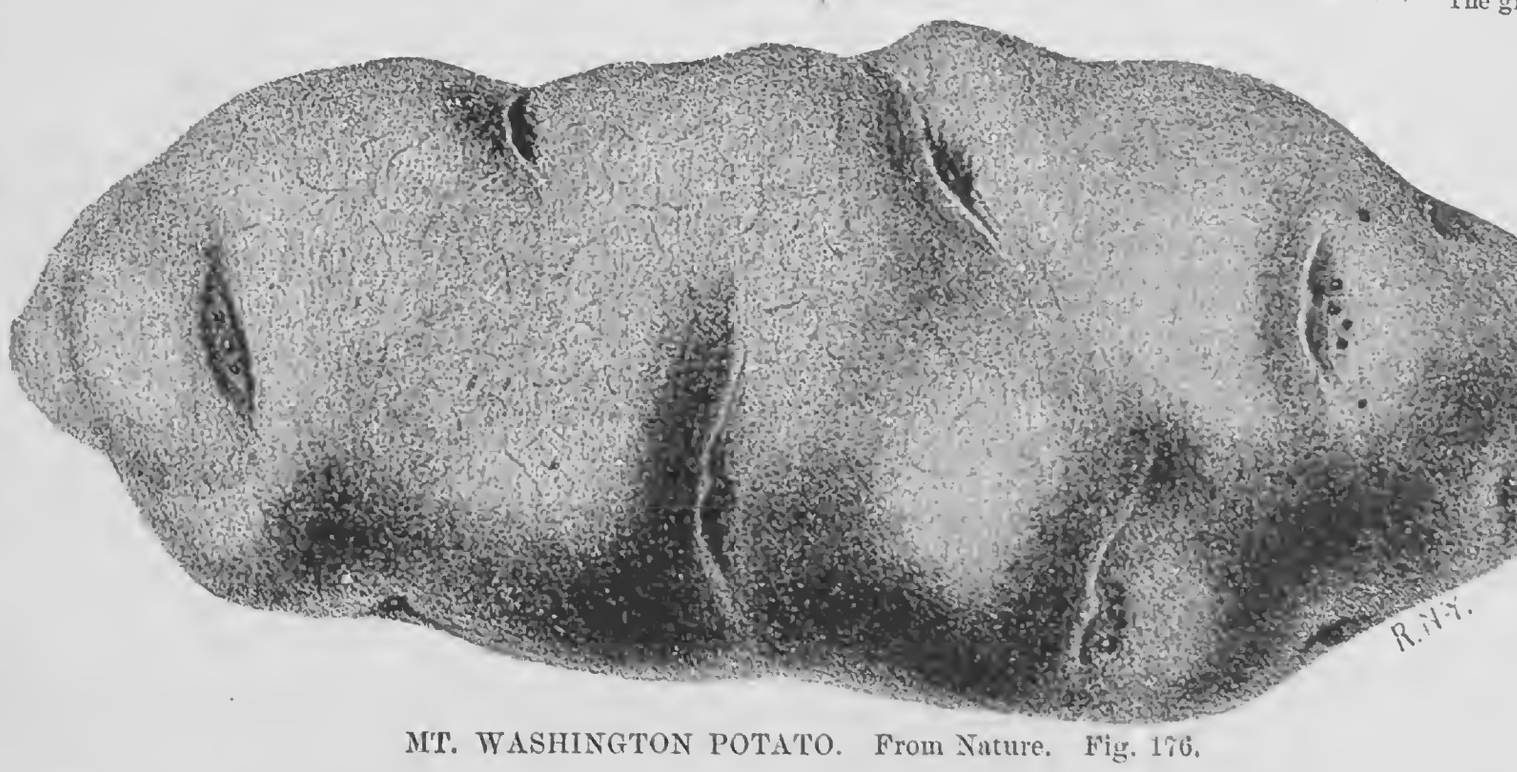
Both lots *matured* at the same time. The seed-end pieces sprouted first and appeared above ground about three days before the others.

We have seen it stated many times that seed-end pieces will give a crop one week or more in advance of pieces cut from other parts of the potato, but our experiments do not support such statements.

Field Crops.

SPRINKLING POTATOES WITH PARIS-GREEN.

MR. J. H. MITCHELL sends us the sketch shown at Fig. 177 (p. 282). This method of applying liquid poisons works well with him. The hind wheels of the wagon are used with a long reach for a tongue. A small frame made of 4x4 scantling is set on the axle with a step behind, as shown in the cut. To this frame the barrel of poison is firmly lashed. A faucet with seven feet of soft, ⅝-inch rubber hose, with a fine lawn sprinkler attached, is arranged as shown in the illustration. The barrel holds about 40 gallons of Paris-green and water. The water is strained so that the sprinkler will not become clogged. Three rows are sprinkled at each trip; one under the wagon and one on either side. It is well to stop the wagon every six feet, as the frequent stopping and starting keeps the poison well mixed. The beauty of this arrangement is that one man can apply 40 gallons of the poison at a much quicker rate than several persons could do it by hand. With a good team which will follow the rows, and not turn over the plants, one man can work this machine successfully. At the ends of the rows the hose can be laid over the barrel and the team turned and started again.



MT. WASHINGTON POTATO. From Nature. Fig. 176.

THE PECAN POTATO.

THIS potato I raised from seed given me by C. G. Pringle, Charlotte, Vt. He had crossed and raised it the season before, and after planting all he wanted, he gave me the rest—about 20 varieties. Several were good; but the Pecan had all the good qualities of the others in addition to some peculiar to itself, so, after awhile, the others were discarded. It originated the same year as the Snowflake. The plant is a stronger and healthier grower than the latter. The variety is a little later and more liable to produce small tubers.

N. Ferrisburg, Vt. L. M. MACOMBER.

Horticultural.

EXPERIMENTS WITH FERTILIZERS FOR STRAWBERRIES.

I HAVE been experimenting with fertilizers on strawberries, but have not been to any great extent successful either in increasing the size or improving the quality of the fruit. Sulphate of ammonia increased the growth of plants. The leaves were large and dark-colored. Muriate of potash did not seem to have the same effect. The showing in fruit was not so good as the showing in foliage. A plot upon which no fertilizer was used produced as much and as good fruit as any of the fertilized plots near it. This has been the result of my experiments for five years.

A few years since Mr. Hale, of Connecticut, strongly recommended a heavy application of bone-dust, two parts; ground fish, two parts, and muriate of potash one part. He said, in substance: "If you want a good crop use 1,200 pounds to the acre; if you want a better crop, use one ton to the acre; and if you want a big crop, put on all you can afford. Then shut your eyes and put on as much more, and *it will pay every time.*" Early in the Spring of 1882 I prepared one-tenth of an acre, carefully measured and staked off, and applied 400 pounds of the above mixture—at the rate of two tons per acre. It was thoroughly harrowed in after plowing, and plants were set three or four weeks later. There were six rows running lengthwise of the plot. Three rows were kept in hills and three allowed to form matted rows. The plot was a part of one acre set at the same time, and all were treated alike as to cultivation, etc. Variety, Wilson. Great was my disappointment when I found, after repeated trials in the picking season of 1883, that the rows not fertilized produced as many and as good berries as the fertilized plot.

The growth of the plants was a little stronger on the fertilized plot than on the rest of the ground. In 1884, however, the plants seemed to have got hold of the fertilizer, and there was quite an appreciable increase in the size of the fruit; but the extra price was not enough to render the extra fertilizing profitable. I have used stable manure with like results.

My method of growing strawberries has usually been to plant on ground that has been used for sweet potatoes for a year or two and well fertilized, and to use no fertilizer at the time of planting. In this way I get fair crops. For several years we have had a "dry spell" in June, during strawberry picking; such was the case the past season, and this undoubtedly, will account for the inaction of some of the fertilizers. Nitrogen, however, in whatever form I have used it, always tells on the foliage, soon after an application.

Vineland, N. J. F. S. N.

A BARREL CUCUMBER PATCH.

LAST year I raised from one hill 1,200 cucumbers, and had it not crowded on to a grass plot, the yield must have been more, for, as it was, fully two-thirds grew on one-half the hill. To do this I take a cheap barrel with one good head, fill it two-thirds or more with manure, bore holes around above the middle, sink it a little into the ground, throw dirt up around it nearly to the top—say six inches above the holes, so that it will not settle below them. I sow the seed freely and leave about 12 of the best plants. The vines will grow 10 to 12 feet. Into the barrel I run a pipe from the sink, but fixed so that a surplus of water runs into another hill. The cucumbers sometimes were very small when picked. I think the seeds were marked Boston Cluster. G. W. S.

Addison, N. Y.

EXPERIENCE IN PRESERVING TOMATOES.

THE first frost of the past season fell here about the middle of November. The previous afternoon we could notice that it was coming and pulled up our tomato vines, leaving all the fruit on them. We piled them up in the garden and covered them with a cloth, leaving them there for three days, so that the

Fig. 177. (See preceding page.)

vines might wither and not break in re-handling. Then we separated the branches which bore the finest tomatoes, tied them in bunches and hung them up in a spare room, opening the door so that the sun would shine in on pretty days. From that time we gathered from these vines more and nicer tomatoes than we ever got before, and our table was well supplied with ripe tomatoes, raw, cooked and in soup, every day till well into the present year. T. J. S.

Fort Worth, Texas.

FOR FIGHTING THE SQUASH BUG, take four pieces of board six inches wide, and from two to three feet long, according to the size of the hills. Nail them together in the shape of a box. Cover this with fly netting—two thicknesses will not be too many. Set the box over the hill, and be sure it fits close to the ground. I have tried this, leaving the box on till the plants have reached the netting: after that the bugs do not seem to trouble them. This protection will also keep off a light frost. Those thus protected alone lived last year, the others having been killed by frost.

Ipswich, Dak. H. T. D.

The Herdsman.

CROSS-BREEDING.

THAT crossing in animal life has proved beneficial in many cases, is no doubt an incontrovertible fact, and yet the chances are rather with a pure-breed than a cross. If I had a dairy of Short-horn cows, I would at once buy a Hereford bull and introduce him to my cows, expecting to improve my stock. But I should not do this calculating my mixed stock would be equal by any means to full-bred Herefords. That this cross will improve the Durhams is a well established fact, and why it is not more extensively practised is passing strange. The progeny of the Short-horn cow bred to a pure Hereford bull can no doubt be put on the beef market at three years old as ripe, and with as great weight as a four-year-old Short-horn. This saving of 12 months in the care and feed of a bullock would give a reasonable profit where a loss would be incurred with a pure-bred Short-horn.

[R. N.-Y.—That a cross of the Hereford and Short-horn often produces excellent results for beef, is shown by the number of prize-winners containing Hereford and Short-horn blood in the "Class for Grades and Crosses," at the Chicago and Kansas City Fat Stock Shows in this country, as well as at the great Smithfield Show in England; but that a dairy herd of pure-bred Short-horns of a milking strain (and no other should be kept for dairy purposes) can be improved for the dairy by an admixture of Hereford blood in the progeny is much more than doubtful. Whatever advantage there might be in the cross for beef purposes, it is more than likely there would be a falling off in milk, as the Hereford cow is a poor milker at the best, and a Hereford bull should not be used on dairy cows unless one intends to change from milk, butter or cheese to beef production. It is hardly likely that a Hereford-Short-horn cross would mature a year earlier than a pure-bred Short-horn with the same feed and care.]

I should adopt the same plan with a flock of small-boned sheep, taking care, of course, not to make too great a departure at once, gradually breeding up until I had a good mutton sheep that would come to an early maturity, the ewes raising at least two lambs apiece.

[R. N.-Y.—It has taken years and a great deal of study, intelligence and experience, to produce our present breeds of mutton sheep, and it is hardly likely that our friend could produce a better kind by the course he thinks he would follow. The ewes of none of our present excellent breeds average "at least two lambs apiece"—that is, in one season.]

So with the swine. The small kinds ripen early; but are not so profitable as those of medium size. But the largest require too long a time to bring them to maturing; consequently should be abandoned as unprofitable.

Erie Co., Pa. A. C. RHODES.

[R. N.-Y.—Each of the well-known breeds is found profitable in certain sections and under certain conditions, and no general assertion as to the profitableness or unprofitableness of any is correct.]

Dairy Husbandry.

PASTURE FOR COWS.

"FIRST a feast and then a famine" doesn't work well with stock, and especially with cows. On this account many dairymen open the whole summer range into one, and let the cows graze on it all. I doubt if this is best. It saves fixing up interior fences and the trouble of looking after things; but "looking after things" is a good business. It is better to have the range divided into at least three separate pastures, and then to change the cows as often as the bite gets short or begins to do so. The field which has the most coarse grass should be used first, and, when this has been well eaten over, the cows should go into the next, and so on, passing a week in each. This would give a nice start to the field fed off first, and allow the grass to be washed clean and present a most inviting bite to the cows. They certainly will eat with more avidity in a fresh pasture. Changing from one to another during the day is a bad plan, as it keeps the stock uneasy and they will lose time waiting to go out. Sometimes it is necessary to allow them a large range on account of water, as this may not be available except in one field. Old farmers often have said that they had rather have poor pasture and plenty of water, than plenty of pasture and a scanty supply of water. In Summer stock will drink a great deal, especially cows, and they will not do well without a full supply.

FEED FOR BUTTER AND CHEESE.

If you want cheese, give the cow food which will make the most cheese: if butter, food which makes the most butter. This is what Mr. Fuller did when he made the last test of the Jersey cow Mary Anne of St. Lambert. This cow had been fed up to the time of the beginning of the test—in five to seven feedings daily—20 imperial quarts of ground oats, 10 of pea meal, three quarts of ground oil-cake, and two quarts of wheat bran. At the beginning of the test this was increased up to 50 quarts. She also had a small quantity of roots, cabbages and apples each day. She ran in a small lot of withered grass. Most farmers expect a few corn-stalks, or poor hay will make the butter for their cows, and if they are dissappointed, they blame the cow.

Saratoga Co., N. Y. F. D. CURTIS.

Farm Economy.

HYDRAULIC RAMS.

THE principle of the hydraulic ram was discovered in 1771 by some plumbers working at a hospital in Bristol, England. The water for the hospital was conveyed in a pipe from a tank on a hill at a little distance. This pipe would burst when the water was suddenly turned off by a stop at the lower end, and to relieve it, they ran a pipe up the side of the hospital until it was as high as the tank on the hill. After this was done, they found that the water would run out of this whenever the water was used and suddenly turned off below, and the pipe was lengthened until it was twice as high as the tank above the outlet of the pipe. Even this would not stop the water from spurting out of the relief pipe, and a tank was put in the building and the end of the pipe turned into it. Then, whenever the stop at the bottom was opened and suddenly closed, a little water would run into the tank.

A Mr. Whitehurst, a watchmaker of Bristol, used an arrangement like this with an air-chamber on it, and patented it in 1772, calling it the "Whitehurst ram." This was not automatic, and was not of much value. About this time, Joseph Montgolfier was experimenting in hydraulics and invented an automatic ram which he claimed he had conceived before he had heard of the Whitehurst ram. This ram was patented in England, Dec. 13th, 1797, by Mr. Boulton, of the celebrated firm of Boulton & Watt. The adaptability of this invention to a practical use was lost sight of until within the last 50 years. As far as is known, the ram was first used in this country in Chester Co., Penn., in 1843, and since that time the construction of such devices has been very much improved. At the present time there are several thousands in use, and there is no doubt that if the principle and usefulness of the contrivance were better known, the number would be greatly increased.

The principle of the single and double ram may be compared with the blow of a hammer. It is not merely the weight of the hammer that drives the nail, but it is the momentum it acquires in falling. In the ram, it is the momentum obtained by suddenly stopping the flow of water in the feed pipe, which raises the water. It is necessary, therefore, in order to obtain the greatest momentum, that the feed pipe should be, first, smooth inside; second, laid straight with a gradual fall from the spring to the ram; and, third, of such a length as to keep the force from being expanded through the upper end of the feed pipe and yet not so long as to increase the friction unnecessarily.

There are at present several manufactures of rams, but all are essentially of the same principle, the only difference being in the construction. Fig. 182 represents a single ram,

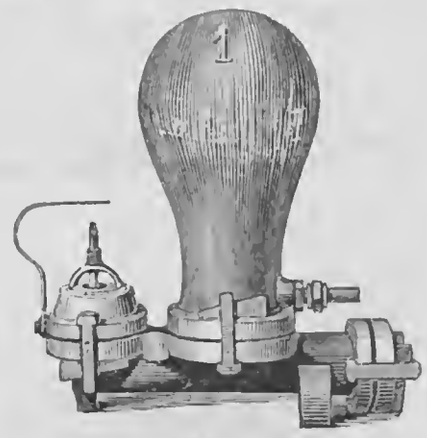


Fig. 182.

so made that it can be taken apart with a hammer. The outlet valve on the left is merely an automatic arrangement for alternately opening and closing the lower end of the feed pipe. It is necessary to have at least four feet fall from the spring to the ram, and 2½ gallons of water per minute, to run a small ram. The larger sizes require more water, but three-quarter-inch pipe is the smallest feed used, and it is much better to use a larger size. The amount of water a ram will raise depends, first, on the fall; second, on the amount of water used per minute; third, on the elevation; and, fourth, on the distance which the water is to be forced. The elevation is seldom over 200 feet.

Fig. 183.

Fig. 183 represents a regulator which is intended to be screwed on the upper end of the feed pipe. In many springs, the flow of water is not the same at all times of the year. Usually for two or three months, the springs will not give more than half the amount they usually do. When the supply to run a ram falls short, and the air enters the feed pipe, the ram stops and will not start again even when the supply becomes as great as at first. It is then necessary for some person to start it. To avoid this trouble the regulator may be used, and, when the supply runs low, it stops the ram by closing the upper end of the feed pipe until the water accumulates at the supply box; it then starts it again.

Figs. 184 and 185 represent the double ram.

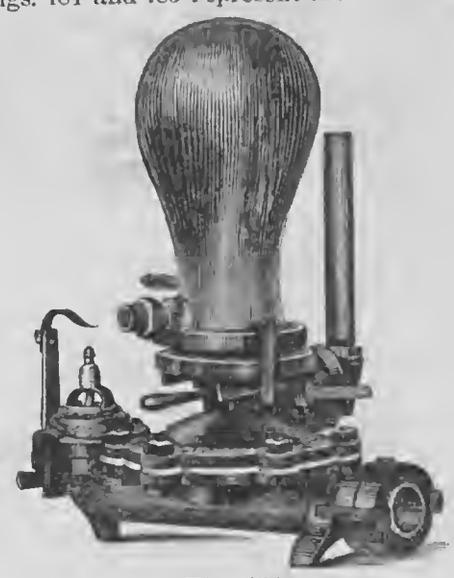

Fig. 184.

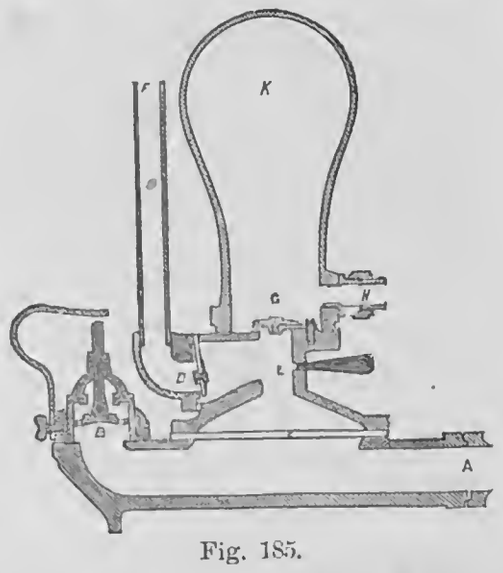

Fig. 185.

With this, impure "run" water may be used to raise spring water without the two being mixed or being brought in contact. The principle is the same as in the single ram. *A* is the inlet for the "run" water; *B* the outlet valve; *C* a solid rubber diaphragm; *D* the inlet valve for spring water; *G* the air-chamber valve; *H* the outlet for the raising pipe to the house; *K* the air-chamber. When the outlet valve, *B*, rises and stops the flow of the water in the feed pipe, *A*, the diaphragm is forced upward, and it thus transmits the force to the spring water. The pipe from the spring is turned into the stand pipe, *F*; but is not connected tightly, so that the spring water not used may overflow. The double rams may be used wherever there is enough fall, water, etc., for the single ram.

Fig. 186 shows the manner in which a ram should be set. There is no cheaper or simpler way for raising water than by the hydraulic ram, nor is there any machine which requires less attention. The first cost and also the cost of maintenance are less than in any other arrangement. There are very few working parts, and hence very little cause for repairs. It does not even require oil. There are thousands of people who can testify to the efficiency and durability of the hydraulic ram. C.S.G.

FODDER CUTTERS.

MUCH has been said in the RURAL and other journals about cutting feed for stock. I believe in it, and my experience has taught me it is the best and cheapest method that can be adopted. One Winter I kept one horse and two cows when corn meal was $1 per 100

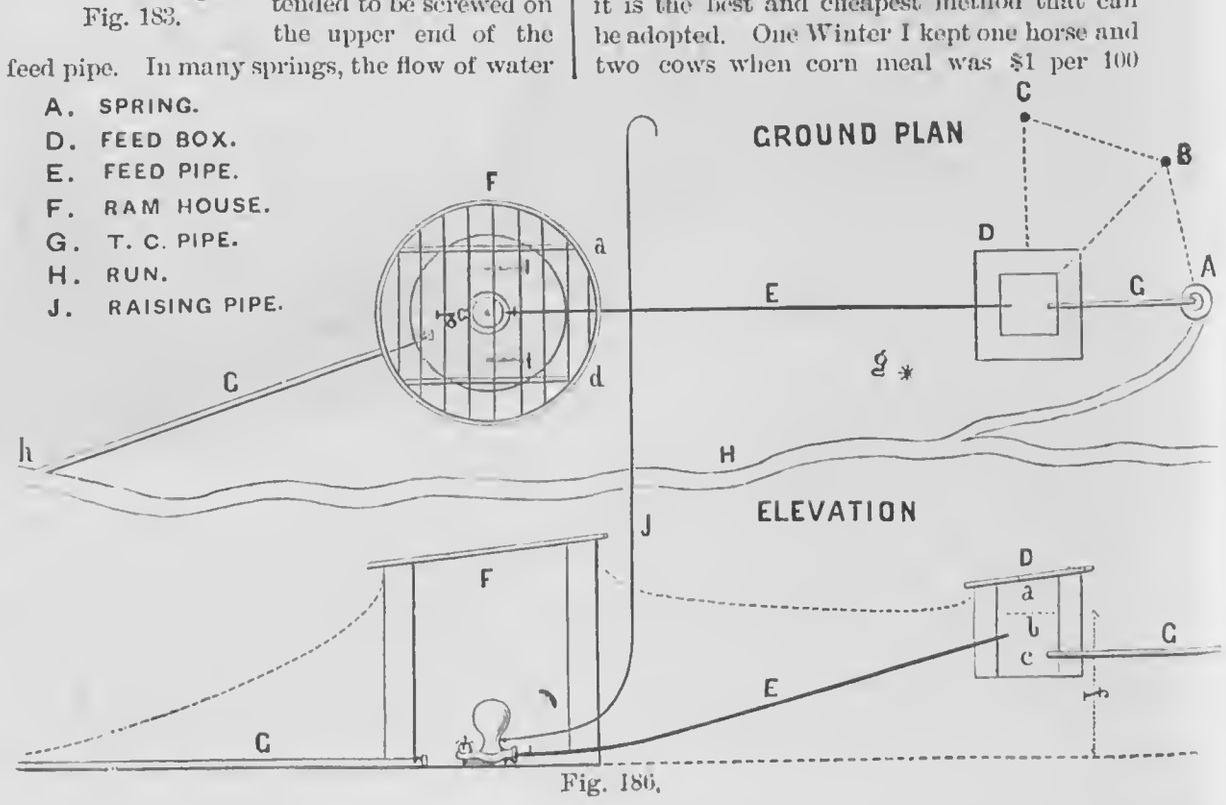

Fig. 186.

pounds, in fine condition for exactly $1 per week, or 33⅓ cents per head. The cows gave a good mess of milk until nearly their time to come in. My rule is to stop milking four to six weeks before calving. The fodder used was good rye straw only. But to cut feed, of course, requires a machine, either hand or power, and here we have to pay from $25 to $40 for a machine that would cut, say, in one or two hours, enough for six to ten head of horses or cattle per day. It is true we can get hand-lever machines for from $8 to $12, but all who have used such for two hours per day, say it is very slow and very hard work. I speak from experience.

Now I fully believe that any manufacturer should have a fair return for all the capital he invests in his business and be able to pay just wages to all his employés, but is it necessary or justifiable to demand such prices for these machines? It will be said these prices are demanded by the retail dealers. True, yet they assert that they cannot sell them for less and get a fair return for their investments, and that the figures are "manufacturers' retail prices." I dare say the last statement is true. I have before me the wholesale price lists of such machines made in and out of this State, and when freight is added to first cost, I think the retailer could not do much better than he actually does. Cannot a good feed-cutter, that will cut, say from half-inch to one-inch long, with one or more knives, as may be best, and with good balance-wheel, crank and self-feeder, to cut in one or two hours all the feed per day for six to ten head of cattle, be manufactured for a large per cent below the present wholesale prices, and be made well and of good material? I have talked with many farmers and hardware dealers on this subject, and all agree that this can be done, and many say "I cannot get a machine at such prices and make it pay." Most of the iron, in fact nearly all used in them, is cast, and much of it is of poor quality. The knives alone are of steel. I have no doubt that those who have a large number of stock and use power cutters, can afford to get them at present prices, as the saving to them is large. It would be well to ventilate this matter as the sewing machine business has been. C. S.

Plover, Wis.

R. N.-Y.—A thorough discussion of the actual cost of all implements would be instructive, and decidedly tend to bring about a decrease of any excessive profits of manufacturers or dealers. The chief causes of such excessive profits, however, are the monopolies created by patents. Patent holders can charge for their goods all the public will pay, as they have no fear of competition, unless they raise the price so high as to make the profits on the goods so great, that it will pay others to risk suits for infringment, etc., by making them without "license," or under some infringing patent, or surreptitiously—a hard thing to do with large implements. The late fall in the prices of sewing machines was due, not so much to the discussion of the actual cost of them—that had long been known—as to the expiration of the Howe, Singer, and other onerous patents. Where anything can be freely made by all manufacturers who wish to do so, competition will always prevent any excessive profits.

Farm Topics.

SAVING MANURE.

THE RURAL has often urged its friends to give their views of any improvements in their mode of farming, which would benefit other farmers. Now, I think my mode of saving manure would be a benefit to all the farmers. I keep four or five cows and two horses, and throw the manure out of the stable windows, as almost all farmers do; but in the first place, I have dug a pit about two feet deep and 20 by 30 feet in area at the end of my barn, and into this I throw all the manure, thoroughly distributing it therein. Then I have, under my stable floor a hole that will hold about a dozen pails of urine, which I dip out and pour on this manure about once a week, and I find the manure worth about twice as much as manure standing in a conical pile through the Winter. It is pretty well rotted and ready for distribution in the Spring. It is but very little work to so dispose of it for the Winter. With larger quantities the pits could be made larger, so that none need be wasted. Then, to protect it from the weather, I have set up some posts and laid on some three-quarter-inch scantlings, and covered the pit with boards, so that it is thoroughly protected from the snow or rains. When I empty it in the Spring it is ready for another batch, and, as I keep my horses and one or two cows up through the Summer, I fill the pits again. If a man has a large amount of stock and a barn, and an underground room where he keeps nothing but manure, he will not, of course, need such conveniences; but for so small a stock as I keep a great saving is made thereby. My land about the barn is hard-pan, so that the urine does not waste by leaching. C. H. H.

R. N.-Y.—This is a "reinvention" of an old method of saving manure, in use in England for years—the pit and covered yard. The great object of the pit or depression in the ground for the manure is to save the leaching and washing away of much of the fertility by water running to some neighboring stream. The roof shuts off heavy rains and aids to the same end, while preventing the excessive soaking and "drowning" of the manure in the pit. Where the soil is loose, the pit is usually lined with clay, to a greater or less depth, to prevent the percolation of the liquid manure. The urine is even more valuable than the other manure; and one of the best ways of disposing of it is here mentioned. In England it is usually distributed over the manure from the pit in which it is collected, by means of a pump and hose. In most parts of this country the construction of such expensive covers, etc., as are often seen on the other side of the Atlantic, would not pay; but where manure is needed and high-priced, it would certainly pay to make cheap arrangements for saving the large amount of valuable fertility now generally allowed to run to waste.

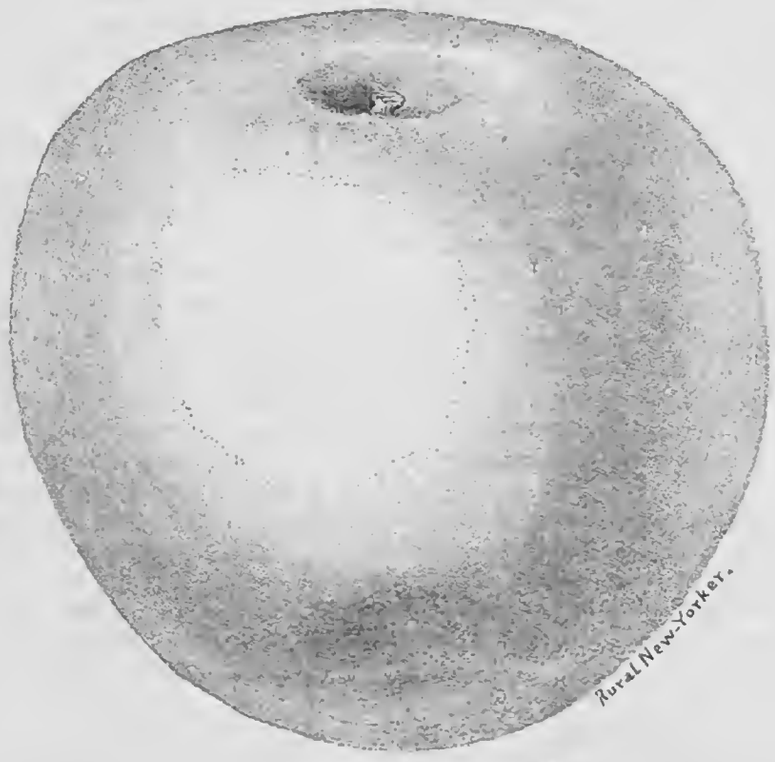
HUMAN FÆCES AS MANURE.

How do agricultural chemists explain the reduced manurial effect of human fæces after they have been kept for some time in dry earth? Do they actually loose any of their manurial elements, or are these only rendered more slowly available? The Chinese, who depend almost entirely on human excreta for manure, as they keep few or no cattle, and excel in producing crops from all sorts of soils, are said to use the material fresh, mixing it with water, so as to apply it as liquid manure. We find it a good deal tidier to divide it with some drying or friable mixture, using it as poudrette. This, like the liquid division, exposes more surface to the digestive powers of the soil and of roots, just as in the case of bones when ground, or of dough, which we permeate and open up with some gas (yeast) in order that every particle may be sooner reached by the gastric juice in the stomach. The added water, however, of course aids the immediate effect of three most important elements of manure—phosphoric acid, potash and nitrogen. The first two seem to find a perfectly secure savings' bank in the soil; but the nitrogen is so flighty in its ways, that the doctors seem to disagree to this day, as to whether it is a first essential, or of secondary account; and whether in its winged form of ammonia, it is liable to fly off and leave plants without their needed daily supply of freshly made nitrates, or not. But I adhere to my preference for the earth closet—or I may say, in my case, sawdust closet—both for tidiness, and its sanitary safety; and because I think that the dried contents, scattered on the soil, if not immediately manurial, will have their full effect in the course of time. "G"

Pomological.

HOLT COUNTY SEEDLING APPLE.

THE Holt County Seedling Apple, shown at Fig. 178, with a cross-section at Fig 179, originated with L. A. Goodman, of Westport, Mo., Secretary of the Mo. Pom. Soc. Shape conical; color greenish-yellow, shaded on the sunny side with a light brick-red, gradually shading away till lost. Stem ⅝ of an inch long, slender, placed in a small, very deep cavity. Cavity a little irregular and partially covered with russet. Calyx *very* small, closed, in a very small, quite shallow, slightly corrugated basin. Core small, with small, plump seeds. Flesh fine-grained, quite firm, juicy, sub-acid, yellow white, very good. We should think this apple a good shipper and splendid for drying. Eaten September 16; in good order.



HOLT CO. SEEDLING APPLE. From Nature. Fig. 178.

HARDINESS OF FRUITS.

T. T. LYON.

AT the meeting of the American Pomological Society at Grand Rapids, Mich., a short paper on the above subject was presented by C. A. Green, of Rochester, N. Y., in which he starts out with the query, "By what process does a variety become hardy, and how is it that we expect hardiness in a variety originated North, and do not expect it in a variety originated South."

First, as to the latter clause of the query:—More than 30 years since while indulging, to a considerable extent, in testing varieties of apples, I collected some hundreds of varieties mostly of Northern origin, among which were perhaps a hundred or more kinds originating in the region south of the Ohio River, including a considerable number from the extreme South. These were planted and grown to fruiting in the same orchard rows with others, natives of New England, New York, Pennsylvania and other northern and eastern localities, under the same conviction announ-

(*Continued from page 283.*)

ced by Mr. Green in the above query: but on coming through some of the very trying Winters of that period, I was not a little surprised to find those of Southern origin entirely unharmed; while those from our own latitude suffered more or less injury. Indeed, the facts fully warrant the statement that in Michigan, in a latitude and climate essentially identical with those of Western New York, very few Northern varieties wholly escaped injury; while not a single variety coming from south of the Ohio River, betrayed even the slightest apparent harm. Even those originating in Pennsylvania and New Jersey, manifested something of this increased hardiness, although clearly in a less degree. Even the Shockley, a variety of extreme Southern origin, entirely bears out these statements; although its fruit proves utterly worthless, while the same is mainly true of the fruit of other southern winter and late Autumn sorts.

These results were, at the time, very surprising to me, and put me upon the consideration of the thought embodied in the former clause of Mr. Green's query, "By what process does a tree become hardy?" To my apprehension this experience tallies perfectly with the observations of Messrs. Budd and Gibb, in Eastern Europe, and leads force to the theory of the former, that hardiness, in the case of Northern fruits, is largely, if not mainly, a question of the ability of the foliage to withstand the exactions of the summer climate, with the result of fortifying the woody tissues against the exactions of the coming Winter. Seedlings at the far South, as doubtless on the steppes of Eastern Europe, are probably weeded by the sun and drought of Summer so that those only of more coriaceous foliage survive, while in a milder northern climate this is in a less degree true. This, moreover, may, in part at least, account for the obvious average superiority of the fruits of northern origin; since, as a rule, superior excellence in one particular, as, for instance, in the fruit, may be expected to be coincident with a deficiency in others; perchance in that of foliage.

South Haven, Mich.

WESTERN EXPERIENCE WITH FRUIT.

My experience with new fruits the past year is as follows:—Downing's Everbearing Mulberry was killed root and branch by the Winter. The Japanese Mikado Pear lost half its head by genuine blight, the bark turning suddenly black and shrinking somewhat; while the foliage remained green for some days. It is three years from bud or graft, had on one fruit, the quality of which was about equal to that of a poor turnip; character of the flesh very similar, though I think the specimen was a poor one. The Sha-li, Chinese Sand Pear, has not blighted; but is winter-killed each year. Petite Marguerite Pear bore half a dozen fruits. Bears young. Fruit small, but good. Kieffer blighted to the ground, where I cut it off, and let a sucker start for a new tree. Le Conte lost one branch by blight this second year from planting. My garden slopes gently to northwest and the soil is clay loam with clay subsoil. The Pratt and Waterloo and Wager Peach trees passed the last two Winters unhurt except as to fruit. We have not had a peach here for four or five years. The Wheatland was nearly killed by the Winter.

Caywood's Marlboro Raspberry made a good growth of healthy plants, but as the red spider took every cane last Summer I had no fruit this year. His Poughkeepsie Red Grape has made a good and healthy growth of vine, for the last two years, but will not stand this climate without protection. The Ulster Prolific is perfectly hardy with me, a strong grower of short-jointed cane. It fruited with me this year. I was well pleased in every way. I was agreeably surprised at the good qualities of the fruit on first taste.

His Black Delaware made but a small growth, but I am sure on account of injury. Shaffer's Raspberry merits all the praise I can give it for the first year with me. A wonderful grower. Fay's Prolific Currant I think should be in every garden on trial. Lee's Prolific Black Currant has not shown any good qualities yet. C. W. K.

Leavenworth, Kansas.

FIGUE d'ALENCON PEAR.

A MISTAKE CORRECTED.

UNDER this name the RURAL, in the issue of April 10, describes and gives an engraving of a pear. There is evidently some mistake in consequence of similarity of names or some other cause. There is an old pear called the Figue, and sometimes, to distinguish it from another Figue, it is called Figue d'Alencon. This is figured in the Magazine of Horticulture for 1848 page 66, simply as the Figue, so named because it is almost exactly like a fig in shape, tapering into the stem. There is also a pear known as the Doyenné d'Alencon, one of the older kinds, somewhat resembling an Easter Beurré, ripening from February to May. This is the pear the RURAL describes and figures. It is quite unlike the Figue in shape, color, and period of maturity, and is a very fair variety cultivated here for 40 or 50 years, but, like the Easter Beurré, it does not generally attain full maturity, and consequently does not keep well, and does not sell well in the market. I have a bushel now just in eating; but their dull green color is not prepossessing. Under high culture and a favorable climate, like that of California, it proves to be a fine variety, as it is double-starred in the list of pears recommended for general cultivation for that location. The Figue, though a very good pear, is too small and inferior in appearance, to induce cultivators to grow it. The Doyenne d'Alencou is worthy of trial under favorable conditions. C. M. HOVEY.

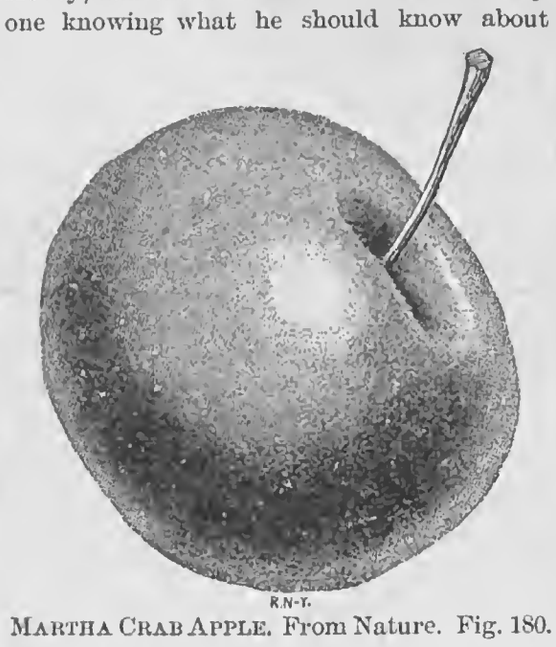
THE OTHER SIDE.

CHANGES IN FRUIT NOMENCLATURE.

A LATE RURAL contained an article from C. M. Hovey, criticising the American Pomological Society, and especially its venerable President, for shortening the names of some fruits in the catalogue.

Having had a hand in making the changes, I wish to appear in defense of the progressive ideas of President Wilder, whose suggestions have to some extent been followed in the revision of the work. If friend Hovey is unable to get out of the old ruts, he of course is at liberty to carry along as many of the superfluous appendages to names of fruits as he chooses; but progressive men in this age will not waste time in unnecessary writing or printing or even talking in matters of business.

Suppose a man must write 1,000 or even 100 labels for Doyenné du Commice, or Hovey's Seedling; by writing simply Commice or Hovey, half the time would be saved. To any one knowing what he should know about



MARTHA CRAB APPLE. From Nature. Fig. 180.

fruits, the short name would be as intelligible as the long one.

But friend Hovey fears that enthusiastic cultivators would be deprived of the honor if the word "seedling" were not attached to the name of the originator. Then, why in suggesting a name for the Concord Grape, did he not prefix the name of the originator, instead of depriving him of the honor about which he seems to have so much anxiety? The public, however, is sufficiently posted on that point without having had to utter for many years the name Bull's Concord Seedling, instead of simply Concord. There is probably no strawberry that gained so wide a reputation in so short a time as the Sharpless, and who does not know that it is a seedling, and that Mr. Sharpless is the originator? In short, all fruits were seedlings (except such as have been produced by sprouts), and it seems folly to waste time, type and ink on unnecessary prefixes and appendages, and I trust progressive horticulturists as well as pomologists will heartily aid in simplifying and shortening names as far as possible.

Friend Hovey seems to have great reverence for names of fruits by French authorities. Americans have been too long admiring everything French. Is it not high time that we, and especially pomologists, should abbreviate some of the French prolixity by which so many fruits have been encumbered? I am glad that an American is leading in the reform of nomenclature of fruits. It seems there should be very few who will not agree with Pres. Wilder and other eminent pomologists, that one word should, if possible, suffice to name any fruit. In many cases it is not advisable, but where confusion would not be caused, let us prune off all unnecessary words. As to the coming fruit cultivators, we need have no fears that Young America will not adapt itself to circumstances in fruit nomenclature as well as to other changes which are continually occurring. H. M. ENGLE.

Marrietta, Pa.

THE NEW NOMENCLATURE.

I WAS much pleased to see Mr. Hovey's defence of the names of the grand old fruits in a late RURAL. For months I have been trembling for the fate of the ancient names, as one by one they have fallen before the ax of the "Nomenclateurs."

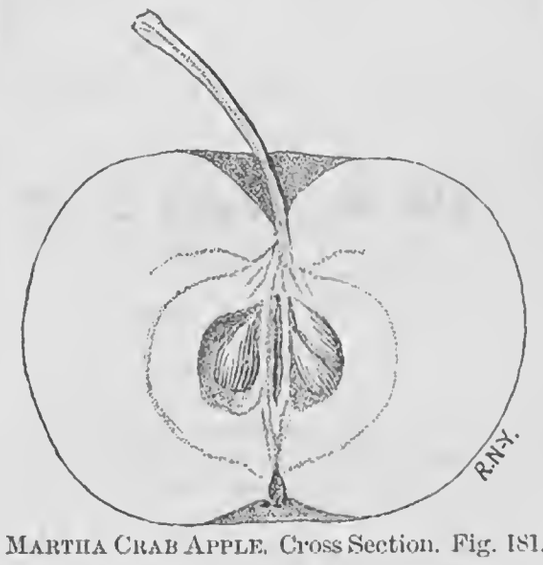
To be sure it is well to stem the tide and change the present direction of name-making, but when I read a few weeks since that the good old Seek-No-Further was to be beheaded, it seemed like revoking the past, or depriving our ancestry of their honored name. To obliterate the fanciful story of its connection with Adam in the Garden of Eden, seemed to call for a protest on the part of all the lovers of that good old apple. (By the way, this is not supposed to be the forbidden fruit.)

But, after all, what is to be done for appropriate names? If the present increase in new varieties continues, the supply will run short, and the choice will be between outrageous names on one hand and a monotonous repetition of more common ones on the other, after the manner of the Missouri family, who, as related to me by the census taker, after having exhausted all the names on the older members of the family, concluded to call the remaining three Big Babe, Little Babe and Baby.

Would it not be well to appoint a committee to bury many of the new fruits before they are fairly christened? DR. F. BIRD.

MARTHA CRAB APPLE.

THE Martha Crab, shown at Fig. 180, with a cross-section at Fig. 181, is quite flat and shaped much like the Lady Apple. Color a faint red, nearly covered with a bright carmine shade, varying a little in shaded places; surface thickly dotted (on one side much more thickly than on the other) with bright yellow dots. Stem 1 1-16 inch long, very slender, and planted in a broad, shallow cavity; a little russeted. Calyx *very* small, open, in a very shallow basin, the color of apple going to the bottom. Core medium, with small, plump, brown seeds. Flesh a pinkish-white, fine-



MARTHA CRAB APPLE. Cross Section. Fig. 181.

grained, firm, quite acid, but pleasant in quality, much like that of the Transcendant; good. A handsome little crab. It originated with P. M. Gideon, of Excelsior, Minn.

THE TYSON PEAR.

IN a late RURAL, Mr. Parnell says of the Tyson Pear:—"I regret to say that I cannot advise any one to plant it, on account of its being so tardy in coming into bearing." I have lived to see two trees direct from the nursery, come successively into bearing. When I was a young man my father bought a tree of this variety, and it grew wonderfully, but did not bear. In the fore part of August next year, he tied a knife to a pole and cut off all the top branches. Next year it blossomed and bore. The clipping was repeated and it bore ever afterwards. Fifteen years ago I came to this State. On a new farm I planted a dozen pear trees, among others a Tyson. It made a rapid and healthy growth. When it was large enough, I clipped the outer limbs and it has continued to bear to this day. Were I to start a pear orchard, one of the first varieties selected would be a Tyson; and when it was large enough I would cut it back, and expect fruit every, or nearly every year. It is much too good a pear to be left off the list of desirable sorts.

Hubbardston, Mich. G. A. S.

Floricultural.

EIGHT OBSCURE ANNUALS.

JOHN N. DICKIE.

OBSCURITY is no evidence of mediocrity. We have a number of obscure flowers not generally cultivated, which should be better known. When I glance at the ordinary flower garden, and see the gaudy colors of the salvia, geranium, dahlia, zinnia, and numberless others of the same class, with so few of the chaste and delicate beauties to relieve the monotonous glare, I wax indignant, if not eloquent. The following eight varieties found in any catalogue, I deem the peers of many of those vaunted flowers which hold their position by might, and not by right. First on the list is

THE ASPERULA.—This is a hardy annual, growing from six to eight inches high. The flowers are light blue—a color rarely found in our gardens. It is a constant bloomer, and of compact habit, growing readily in any fair garden soil. For a small bed by the side of the house, along the fence, or in the border, nothing is better. It is also excellent for rustic baskets and rock-work. For bouquet making, our lady readers will find it all that can be desired. Raise the plants in boxes in the house, thinning well. Set out in May and they will bloom the latter part of June, keeping up a constant succession of flowers until after hard frosts.

THE ANAGALLIS is another desirable annual, but is not so good for bedding as the asperula. In planting flowers in the permanent flower garden, we should select those which will bloom the whole season. This the anagallis will not do save in large baskets or rustic work, where it is watered regularly. The seed-pods should be picked off and the soil made fine and rich; then we possess something of permanent beauty. The flowers are of various colors, but the blue is especially desirable. Planted in beds, it blooms profusely for about four weeks; after that the plants "straggle" out and give but few blossoms. Directions given for growing the asperula will also apply to the anagallis.

THE BROWALLIA is for sale at many greenhouses, but it is of limited cultivation. For a single plant you will have to pay 15 cents; but for a nickel you may own a paper of the seed and raise from 50 to 100 plants, which will bloom the first of July, increasing in size and beauty until frost. They will grow two feet high in rich soil. The flowers are small, blue, blue and white, with a pure white variety. Blue, however, is the prevailing color. The seeds are very small and need care in sowing. Scatter them on the surface and press them in with a piece of shingle. Moisten with warm water and cover with moss. This rule should be followed in starting any minute seeds, as the sudden drying of the soil will destroy the tender shoots in an hour's time. The moss must be removed as soon as the plants break ground. The Browallia is tender and should not be planted out before May 20. It is a greenhouse perennial and may be cut back in the Fall and potted for winter blooming.

THE SWAN RIVER DAISY is catalogued as Brachycome iberidifolia—a name considerably larger than the flower—grows from six to 12 inches high, according to the richness of the soil. The foliage is finely cut, the flowers single, of good size, on long, slender stems. It has one bad fault—liability to rot off at the surface of the ground. It is an especial favorite of mine, but I invariably lose half of my plants. I am afraid I pet them too much. Next season I propose to avoid watering it, merely keeping the ground well stirred. I think I have given it too much watering.

THE CENTRANTHUS.—Reader, I shall be almost vexed if you grow this flower and do not think as well of it as I do! I distinctly remember the first time I planted it—some 20 years ago, when seedsmen were rare, and catalogues few and far between. I purchased it at a venture, and when it came into bloom I went into the most unfashionable ecstacies. That is just what I want you to do, friends. Act a little silly just once, please, and know what a luxury it is to be a child again! The seed of centranthus may be sown in the open ground where the plants are to flower, as it is rather difficult to transplant. The stems are almost transparent, of a light green, and, I regret to say, are a little clumsy; or, in other words, there is rather too much handle for the flower. But the blossom will make up for any such little shortcoming. Colors, pink and white. Blossoms continuously from June to November.

THE PHACELIA is a hardy annual, and not at all suitable for the flower garden, from the fact that the seed-pods are too conspicuous, and the habit of the plant slovenly and ungraceful. It is excellent for bouquets, however, and I generally grow it in some retired corner, visiting it regularly with the scissors. The blue is the best, although there is a white variety. Sow in the beds where it is to bloom.

THE SALPIGLOSSIS is a rare, but beautiful, half-hardy annual. The blossoms are peculiarly rich, pencilled in the most beautiful manner by the hands of the Divine Artist. Grows from two to three feet high. Sow in boxes in the house, and set in a single row 18 inches apart. Few flowers will attract the attention of the visitor more than this. In my experience, out of 100 who see it in bloom, not a half dozen ever noticed or heard of it before.

THE WHITLAVIA.—If ever a modest flower bloomed, probably this is it. The foliage is

delicate, the clusters of flowers drooping, bell-shaped, blue and white. The blue is especially desirable. It will thrive well only on the north side of a building or tight fence. It will stand any amount of cold, wet weather, but the hot sun and drying winds will soon put an end to it. Select a place, therefore, where the sun will not strike it, save in the morning and evening. Keep it well watered and you will have the best of success. Fuchsias treated in the same manner bloom most beautifully during the summer season.

As a rule, it does much better to sow seed of all flowers, unless difficult to transplant, in boxes, seed beds, or, better still, in the hot-bed. You can then set the plants the required distance apart, and are much surer of their germination.

Crawford Co., Ohio.

Arboricultural.

VITALITY OF NUT SEEDS.

HERE is my experience with regard to the vitality of different sorts of nuts:—Some years ago I procured in the Spring some of the Western Shellbark Hickory nuts that had been dry all Winter. They were placed, one at a time, in a vice and the screw was turned very carefully until a slight cracking was heard, when the nut was removed. When they were all thus "cracked," they were placed in water for two or three days, then planted, and nearly every one grew. Two of the plants are now alive; the others died on being transplanted. They are entirely hardy here. Again I procured, in the Fall, some almonds, pecans, English walnuts and filberts, all of which were dry. They were placed "uncracked," in water for two or three days, then buried out-of-doors. In the Spring many of the almonds, one English walnut and some pecans were sprouted; the filberts did not grow. The almonds and English walnut are still growing, the former having been bent to the ground and covered in Winter; the latter winter-killed a little the past two seasons. The pecans were planted in a fence corner and came up nicely—with the aid of squirrels.

I was told that the seeds of the Honey Locust must lie in the ground a year before they would grow. Passing a tree by the roadside one Winter, I picked up a pod of seeds and took it home, and whittled just through the outer covering of the seeds and planted them in pots, and in a few days they were up. I whittled the seeds of Clianthus Dampieri, and they came up in four or five days. If boiling water is poured over canna seeds and immediately poured off, plantlets will come up in a few days. Pear seeds that have been dry for months will grow if soaked in water a day or two. J. T. MACOMBER.

Grand Isle Co., Vt.

TIMBER CULTURE IN RELATION TO ORCHARDS.

THERE is much being said in our agricultural papers nowadays about hardy fruit trees, and discussions are being carried on as well as experiments, on the merits of many of our new, as well as some of our oldest varieties of fruits, with the view to finding some varieties that are absolutely hardy. This is all very good and must result in good to the country at large; but while we are doing this, let us at the same time remember that it is almost as easy to make a climate that will allow our fruit trees to live, as to make a fruit tree that will live in our climate.

Twenty-five years ago when Southwestern Iowa was new, one often heard the expression, "Oh it's no use to try to grow fruit here, it will never amount to anything." What is the state of affairs there to-day? There is no abundance of fruit there, and some of it is the finest, and the fruit that took the grand sweepstake premium at New Orleans, came from this very locality. What is the reason of this? It is largely due to the fact that every farm has a more or less extensive grove which has done much to modify the climate, by lessening the force of the wind, and also in equalizing the temperature so that the rainfall has been less at a time, but has come oftener. What has already been done in this line is very good, but we should not stop here. Much more remains yet to be done, and while we are trying to get trees that will live in our climate, let us at the same time make a climate in which our trees will live.

Plymouth Co., In. M. VINCENT.

Subscribers of the RURAL *need never take the trouble to write us to "stop" the paper. It is invariably discontinued at the expiration of the subscription term, except by oversight, in which case it is our loss.*

BLACK SILKS.

JAMES McCREERY & CO.

Will make this week a Special OFFERING of the following makes and qualities of Black Dress Silks:

100 PIECES
Of Black Imported Surahs at $1.00; our regular $1.25 quality.

100 PIECES
Of Black Satin Rhadames at $1; marked down from $1.25.

150 PIECES
Of Black Rhadames and Tricotines at $1 25; excellent value for $1.65.

75 PIECES
Of Black Satin Damasses, 24-inch, at 85 cents; reduced from $1.25.

RICH NOVELTIES
In Watered Silks, Moire Francaise, Satin and Moire Pekins, Cluny Stripes, Crochet Figures, etc., suitable for Combinations and Wraps at very low prices.

Samples sent on application.

ORDERS BY MAIL
from any part of the country will receive careful and prompt attention.

Broadway and 11th St., New York.

What Others Say

THE HAT AND HAIR IN HEALTH.—Dr. Dio Lewis says that the beard about the mouth and nose saves the lungs. The back of the neck should be protected in cold weather. The hair alone can do this perfectly. The present practice of shingling off the hair at the back of the head may be fashionable, but it is unphysiological. Eight men suffer from catarrh where one woman has the disease. Men keep their heads in a sensitive condition from the moisture and heat of the hat. A woman's hair is an abundant protection. A man thinks he must always have his hat on while out in the air. There are a few professions where a bald head is desirable, but a remarkably small percentage of men ever get into them. Most of the bald heads in the country might be used as tomb-stones to chronicle a murder by the fashionable hat. To copy from Shakespeare, we might say, strange that man should put that upon his head which steals away his hair. The difference between the temperature under the hat and in an ordinary room is about enough to give a weak man a cold. The hair below the hat is seldom lost. It is natural to suppose that if we keep the hair under the hat nearer the conditions, as regards heat and moisture, to that below it, the growth will be stronger. Ventilation should be supplied by means of holes punched through the sides and top of the hat. There is not half the danger in keeping the head cool that there is in keeping it hot. We never could see how the modern stiff hat ever came to be made so extensively. It is cold and clumsy, and simply murders the hair.

FULL AS A TICK.

NEWBURGH, September, 1885.
Fowls or Eggs in Season.
EGGS, $2.00 per 13; $3.50 per 26.
Dr. E. Ross Elliott,
P. O. Box 267, MONTGOMERY, ORANGE CO., N. Y.

HATCH The CRAIG Folding Incubator and Brooder (combined) will hatch from 1,200 to 1,500 chicks per year, worth as broilers from $4 to $12 per dozen. No cost or experience to operate. Holds 100 eggs. Price $12.00 An absolute success. Perfect imitation of the **CHICKS BY** late success. Perfect imitation of the hen. No lamps to explode. Ten hens will pay $200 profit per year. Send 4c. for new 36-pp. book on poultry, incubators, etc. F. D. CRAIG, North Evanston, Ill. **STEAM**

Halstead's Perfected Centennial
INCUBATORS AND BROODERS.
First, Foremost, Best. 50 Egg Machine, only $20.
Centennial M'f'g Co., Box 250, RYE, N. Y.

SHELLBONE for POULTRY.
A mixture of Pure Bone and Ground Oyster Shells. All poultry need it. 25 Pounds, $1.00; 50 Pounds, $1.75, by freight. Samples, .05c. mail.
T. H. BOCK, Crisfield, Maryland.

Best Hatcher
ON EARTH.
Hatches Ducks, Turkeys Geese and Chickens. Received First Premium where exhibited.
Send for Circular.
ANDREWS'

Agents wanted. Ask your dealer, and show him this advertisement.

(*Continued from page 285.*)

JOSEPH COOK thinks if a man had a dog which was in the habit of chewing, smoking and expectorating tobacco anywhere and at all hours, the animal would have a short life. Yet the same man never thinks of killing himself for the same offence.....

UNCLE ESEK, in the Century, says that indolence is a disease of the soul, laziness of the body.....

HE says that the great struggle for life is first for bread, then butter on the bread, and at last sugar on the butter. This is the best any of us can do.....

HE says that all cunning men are dishonest, or will be the first good chance they get.....

HE says that he does not believe in special providence. When a mule kicks a man and knocks him anywhere from eight to twenty feet off, he doesn't lay it to the Lord; he says to himself "that man got a little too near the mule".....

AMONG dwarf peas, there is no better kind than the American Wonder. It is within three days as early as the earliest tall smooth peas. The quality is best.....

A WRITER in the N. E. Homestead says that a succession of cabbage may be gained to some extent by different settings, but better by varieties. The later and more desirable kinds are not early enough, even if set early, to insure maturity for the earliest and best market. He considers that three varieties are sufficient to meet all demands, in the order of succession—the Early Winningstadt, Henderson's Summer, and Fottler's Improved Brunswick. Some gardeners prefer the Jersey Wakefield to the Winningstadt for the very earliest; some set the Newark Early Flat Dutch in preference to Henderson's Summer.

THERE is, however, very little difference or choice between the two better varieties. As soon as the Hendersons come to market, which will be a little later than the Winningstadt and Wakefield, they supplant these kinds, and they will in turn have to give way to the larger and more showy Brunswick, but at about the same price. There is no doubt that the French Early Etampes is as early as any, and that it is of superior quality, but it is more shy, is apt to spot, and will not bear transportation, or keep fresh as long as the other early kinds mentioned.....

WE find the following in our respected contemporary, the New England Homestead: "A single neighborhood on Long Island sends 300 to 500 live birds a week to the New York stores. One New York village ships 50,000 to 80,000 during a Summer." Think of this! If ever the farmers of our country should make their voices heard on any question, they should speak out against this suicidal, unexcusable, inhuman vanity which makes the slaughter of our little birds profitable.....

THERE are a good many people who are going to keep a sharp eye hereafter upon the politicians who are willing to sell themselves to a league of rum-sellers, and help to promote their shameful and deadly designs, says the Homestead. May their numbers rapidly increase!.....

DR. CLAWSON, of the Edinburgh Asylum for the Insane, is disposed to substitute milk for stimulants in hospital practice. In very acute cases, both of depression and maniacal exaltation, when the disordered working of the brain tends rapidly to exhaust the strength, he relies more and more on milk and eggs made into liquid custards.....

W. H. BOWKER thinks that S. C. "floats" will furnish phosphoric acid for future generations, but that the man who wants to harvest his crop in September had better let them alone.....

MR. HENRY BILL says that millions of dollars' worth of manure are buried in the muck swamps of Connecticut. Its value will never be realized until it is hauled out to the hills and exposed to the sun and air.....

YOU would have cause for genuine happiness if you knew there were 100 loads of good muck in your barnyard, over which the cattle had been tramping all Winter.....

AT the Michigan Agricultural College it is proposed to set a huckleberry plantation next Spring.....

Is there any reason why a sheep cannot be made to work a light dog-power for running the churn? Here is a good chance to make capital out of the surplus energy of the old ram.....

How do you strain your milk? If you use a cloth, how often do you wash it? Too much of the impurity of milk comes from the strainer.....

PROF. L. H. BAILEY well says the adornment of rural homes should be considered a necessity rather than a luxury. As the country becomes older, and natural windbreaks are destroyed, it is imperative that we plant for protection. The attractions of farm life for our sons and daughters are largely determined by the character of the arrangement and exterior adornment of the home and farm premises.....

Everywhere.

RURAL SPECIAL REPORTS.

California.

CARPENTERIA, Santa Barbara Co., April 14.—There has been plenty of rain all through the past Winter. Just now it appears to be clearing away after the biggest rain in April since I came here. Grass and feed for stock never larger and greener at this time of year. Much of the early-sown grain is prostrated by the late storm. Have had almost 24 inches of rain for the season. Most of the corn and "bean" land was in fine condition for the seed, but this storm will put the farmers at work to mellow up the soil and kill the new crop of weeds. The prospect is fine for a good harvest of most products of this section.

O. N. C.

Indiana.

PENDLETON, Madison Co.—There has been a rapid advance all along the line in breeds of stock. Twenty years ago the native scrub cattle were in large majority; and were ready for market at four years, with an average weight of 900 pounds. Short-horns had been introduced and intermingled; and ten years ago steers were sold at four years, weighing 1,100 to 1,200 pounds. Now a majority are high grades, and it is not unusual for a two-year-old to weigh as much and often more. Herefords, Galloways, and Aberdeen-Angus have since been introduced and the effect they will have on beef cattle of the State, remains to be seen. I predict that hornless cattle will be in a majority before ten years. Domestic cattle have no more use for horns than pigs or sheep.

S. W. H.

New Jersey.

HARBOURTON, Mercer Co.—Wheat and grass much better than at this time last year. Prospects for all kinds of fruit fair. Prices low—wheat, 98 cents; corn, 40 cents; oats, 35 to 40 cents; butter, 30 cents; eggs, 22 cents; potatoes, 65 cents.

D. J. B.

New York.

JOHNSTOWN, Fulton Co., April 20.—Some RURAL seed have done very well. The Johnson Grass did not come up. The Thousandfold Rye was partly destroyed by cold, but I saved about two quarts, which I sowed again, and it looks very well. Potatoes rotted very badly in our neighborhood, and are very high in price now—75 cents a bushel. The Blush did not rot at all.

G. M. P.

WILLOW CREEK, Tompkins Co.—Not many potatoes on hand. They have rotted and frozen quite badly. Prices about 33 cents, tending upward.

A. B. W.

HORNELLSVILLE, Steuben Co., April 19.—Potatoes in this section—a heavy potato district—have been mainly picked up, and the warehouses at Arkport, the main center for this vicinity, are nearly empty. What few are left are in good keeping condition, but prices are low—only 35 to 40 cents the extreme figures offered—but as inquiries are being made for seed, it looks as though they might be higher. Kinds preferred here—Burbanks, Star and Late Hebron (W. E.). The Rural Blush is thought highly of as a first-class table potato, and very hardy, with no signs of rot. Similar reports from Liberty, Avoca, Wallace, Cohocton Valley in this county, another large potato district.

C. J. P.

Vermont.

CHARLOTTE, Chittenden Co.—Stored potatoes not rotting in this section. Stock on hand not large. Snowflakes and Garfields were 75 cents a bushel, when other varieties were only 50 cents for the Boston market. White Elephant, Burbank and that class are now fetching 37 cents, while Snowflake and Garfield bring 55 cents. I am quite sure potatoes will advance in this section after planting time.

O. H. A.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

KEEPING SHEEP "ON SHARES."

A. S. Q., Hope Church, Pa.—In the Fall of 1884, a neighbor got me to allow two of his sheep to run with mine. In the Spring both had twins. He wants to take them home; ought he or I to have the increase.

ANS.—The usual arrangement by which sheep are kept for an owner is that the keeper takes half the produce yearly; that is, half the wool and half the increase. In this case, it is supposed that the keeper had the wool last Spring; if they had no lambs then, half their wool should belong to the owner, and to make the matter even now, the two years' wool and lambs should be divided evenly, which would be fair to both parties. A great many sheep are kept in this way.

ABOUT RASPBERRIES AND STRAWBERRIES.

O. E. D., Hampton, Ia.—1. Canning factories usually pay about six cents to eight cents for black raspberries and eight to ten for red. 2. For strawberries they generally pay from four cents to six cents. The price varies in different locations, and in different seasons in accordance with the relations of supply and demand. 2. The average yield per acre of raspberries ranges from 2,000 to 3,000 quarts; strawberries from 3,000 to 4,000 3. The average cost per acre of raising each is about $75 for raspberries, and $100 for strawberries, including picking. 4. One-quart glass cans cost $7 to $8 per 100; two-quart cans, $9 to $10. 5. Cost of picking raspberries, 1½ to 2 cents per quart; strawberries, 1 to 1½ cent.

COW-PEAS.

P. P. W., Milford, Del.—The Southern cow pea will grow upon any good soil; 25 to 30 bushels per acre is a usual crop. It is a valuable grain for stock and, when ground with corn, makes a perfect grain food. It is really a species of bean (Dolichos), and is more nutritious than peas; the haulm is also exceedingly good fodder. The seed—two bushels per acre—is sown about corn planting time. For cows, this grain should be ground as above, and an equal quantity of bran be added to it. If cut green, it is an excellent soiling crop, but is more valuable for the grain. There are about a dozen kinds; the "Whip-poor-will" and the Clay varieties are the most popular.

Miscellaneous.

A. T., Sprague, W. T.—1. Are the improvements, such as breaking, fencing, etc., on a homestead before "proving up," and while, therefore, the title is still in the United States, taxable? 2. My hens suddenly appear drooping for a few days, and then all at once, drop dead. On opening them I find the liver swollen, and on it and the heart are small cancers; what's the matter?

ANS.—U. S. lands cannot be taxed. Any improvements belonging to the real estate, as houses, fences, orchards, etc., are, therefore, not taxable until the owner gets his patent. 2. There is no cure for this disease, which is anthrax or intestinal fever, and it affects the liver and heart, as in this case, as well as the intestines. It is quite often caused by overfeeding, and is contagious. The only cure is prevention.

S. R. C., Bellefontaine, Ohio.—I have a piece of ground 300x240 feet. My water supply is at the middle of the other end. I wish to use a hand force pump, laying the pipe down the center, how many feet of lead pipe will be needed, and how many feet of hose will throw water to each side of the plot?

ANS.—If the pipe is laid in the middle of the plot for 200 feet, and a connection made at 100 and at 200 feet, and a hose 70 feet long is used, the water need only be thrown 50 feet, which can be done with a good force pump. Lead pipe is dear, and the new rustless iron pipe made by W. T. Wells, 7 Cliff St., New York, is even more durable and less costly than lead, and is, moreover, perfectly healthful. Pipe 1¼ to 1½ inch would be large enough. The larger the pipe, the less friction, but the more expense.

N. L. K., S. Dansville, N. Y.—1. On dry, gravelly soil would Mapes' fertilizer be a good application with farm manure? How much per acre? What would be the best kind for potatoes? 2. Which are the better farm scales—Jones's or Osgood's?

ANS.—1. Yes; Mapes or any other brand as good. If you use more farm manure, use less fertilizer. As a rule, in using chemicals with farm manure, we should use more bone and less potash and nitrogen. For potatoes, however, a larger quantity of potash should be added. Now, if 20 tons of farm manure are spread per acre, then we should add about two bags of bone flour to one bag of sulphate of potash, or, say, four bags of kainit. For potatoes we deem it most desirable to turn the farm manure under in the Fall and to sow the chemicals in the Spring. 2. Get either, and you will have no cause for grumbling.

R. R., Bloomingburgh, N. J.—The great-grand sire of my calf was a registered Jersey; its great granddam a half-blooded Ayrshire. Its granddam the result of this cross; the grand-sire a registered Jersey; its dam was the offspring of the foregoing cross and its sire a registered Jersey, what is the calf and is it eligible to registry.

ANS.—The calf is seven-eighths Jersey. It has 87½ per cent. of Jersey blood. Its granddam took 50 per cent. of Jersey blood from its sire. Its mother took 50 per cent. from the sire and 25 per cent. from the dam, thus having 75 per cent. of Jersey blood. The calf took one-half its blood from the sire and one-half from the dam, figuring as is usual in such cases. This gives 50 per cent. Jersey from the sire and 37½ from the dam. It is not elegible to registry. 2. H. C. Carter, New York.

G. T., Dodge Centre, Minn.—My horse's hind leg swells from the fetlock to the hock. When he stands for a time without exercise it swells to twice its regular size. The front of hock-joint is cracked, and there is an oozing from it. It is warm. Swelling goes down with work.

ANS.—Apply to the cracked skin an ointment made of equal parts of spermaceti and almond oil. For the stocking of the legs see "Stock Leg in a Horse," in the R. N.-Y. for Feb. 20, 1886. In connection with medicinal treatment, daily exercise is very important.

Subscriber (address mislaid).—1. Can potatoes be so chilled that, although they have not been frozen, they will not grow? 2. If hen manure is mixed with muck or loam and applied to corn in the hill, should the manure come in direct contact with the corn?

ANS.—It is hard to say where the dividing line between a chill and a freeze would come in. As a rule, chilled potatoes which have been kept at a temperature close to freezing for a long time lose their vitality. 2. It is safer to interpose a thin layer of earth to prevent the possibility of "burning" the seed.

G. H. R., Big Rapids, Mich.—On a sandy gravelly soil, some of which has been in grass for a while and some in corn, on which oats is to be sown this Spring, with clover seed, Orchard Grass and a little Timothy, how much seed per acre should be sown, and should there be any addition to the mixture?

ANS.—Orchard Grass does not always do well with oats. Sow 2 to 2½ bushels. Afterwards sow 10 quarts of clover. Timothy is considerably later than Orchard Grass.

C. A. P., (no address).—To break a mare of the habit of carrying her tongue out of her mouth, try other forms of bit to make sure that it is not due to the particular one in use. Otherwise we can only suggest that you make a sling for the tongue. A small sack placed over the free end of the tongue, with a string from each side to pass back and be tied behind the ears, will answer the purpose.

W. M., Springer, N. M.—Two of my horses became weak in the back, dragged their hind legs. There was a stoppage of urine. Both died in a few days. What was the matter?

ANS.—The symptoms would indicate some disease of the urinary organs, but they are too brief to enable us to say definitely or to recommend any treatment.

G. T. D., East Randolph, Vt.—"Young plum trees that made a very rank growth last season" should be cut back, as much or as little as one chooses; generally the less the better unless the branches interfere. Prune now. 2. The Woodason Bellows for blowing pyrethrum powder, etc., on insect-infested plants, are the best. All leading seedsmen sell them. Price $1.00 to $1.50.

"Subscriber," Dansville, N. Y.—Opinions differ as to the best kind of roosts for poultry. We prefer low roosts, not over 18 inches high, and made so broad at the top as to give the hens' feet full rest and support. Any wood that will not splinter is suitable.

J. E. W., Utica, N. Y.—For grinding bones Wilson's patent bone and corn mill is an excellent device. Different sizes are sold at different figures. Send for circulars to Wilson Brothers, Eaton, Pa.

O. B., South Haven, Mich.—The Great American is one of Durand's best varieties of strawberries, but it thrives only under the most favorable conditions, and we advise you to try it in a very small way.

An Old Subscriber, Mospeth, L. I.—1. We have little confidence as to the curative properties of the plant inquired about. 2. "Copying" requires skill. One in a hundred may make a little at it; the 99 will fail.

J. D. T., Brookside, N. J.—The better way to "lime" low meadow land intended for crops, is to do so before plowing. Then harrow. This would be our way, though many would differ.

T. A. P., South Bend, Ind.—So far as we know the Jewell Strawberry is not tender in the bud "like the Sharpless."

O. H. S., Franklin Forks, Pa.—Downing's Everbearing Mulberry is probably the best for your climate.

A. B. C., Maple, Mich.—The watermelon

seeds of the F. S. D. can be distinguished only by their color and general appearance.

DISCUSSION.

BOILED TO DEATH.

T. H. H., NEWPORT, Vt.—Recently in replying to the question of a correspondent in one of our Vermont hill towns, where hay can often be bought in the field for six or seven dollars a ton, while stable manure cannot be bought at all, and commercial fertilizers have to be hauled long distances, I said that it was more profitable for such farmers to buy hay, and feed it to dairy cows, than to buy fertilizers. The Homestead boiled this advice (which was given with reasons at some length) down to a stickful, omitting the qualifications. The RURAL evaporates the Homestead's concentration to dryness (and falsity) by baldly stating that "Dr. Hoskins insists that it is cheaper to buy hay than manure." Allow me to say, Messrs Editors, all, that you are running this business of "boiling down" into the ground. No man can live, physically, on beef extract, neither can the human mind be nourished on evaporated facts. The facts escape in the process, and naught but a worse than worthless residuum remains.

MULLEIN FOR COLDS, ETC.

C. W. B., LOS ANGELES, Cal. —A short time back I noticed a clipping from the RURAL NEW-YORKER, speaking well of mullein for consumption. Here is my experience with it: In 1882 my wife was afflicted with a very bad cough. It got worse and worse, and no medicine I tried afforded any relief. At last, hearing of the good effects of mullein and rock candy, I went into the fields and pulled up a lot of young mullein plants, washed the roots, placed them with the tops in the kettle, poured water over them, and boiled the whole down to a sirup, which I put in large bottles, adding rock-candy and brandy enough to keep it from spoiling. My wife used it as medicine, and in one week was well and sound. I have no doubt whatever that medicine of this kind will have excellent results in ordinary cases of lung troubles, colds, etc., whatever be its effect in cases of pronounced consumption.

R. N.-Y.—A decoction of mullein has long been used in domestic medicine to allay coughs and other irritations of the air passages and vessels, and externally as an emollient for relieving soreness, inflammation, swelling and pain in cases of tumors, piles, etc. On account of its use in lung troubles of cattle, one of its common names in England is bullock's lungwort. Rock-candy has often a soothing effect in colds. Instead of keeping the mixture "from spoiling," many would think it would be "spoilt" by the addition of brandy; but, like several other "poisons," brandy is often beneficial taken medicinally.

FLAGEOLET BEANS.

C. E. P., QUEENS, N. Y.—In the RURAL for April 17th, I notice an article on the Flageolet Beans, and as it may possibly lead to a decided increase in their cultivation, I desire to offer a few remarks regarding their proper table use. I have at one time or the other grown most, if not all, of the different varieties of dwarf or bush beans in cultivation, and as far as my experience has extended, I have found that all of the varieties known as Flageolets are entirely unfit for use as a snap or string bean, being tough, stringy and inferior in quality. As a shell bean used in either the green or dried state, they deserve all that can be said in their praise. I consider the Green Flageolet the best of all for amateurs to cultivate. I also think Dreer's Improved the best of the Limas for general cultivation. I tried the Challenger Lima last season, and was very much disappointed with it. Not only did the flowers set very sparingly, but in most cases the pods contained only one or two beans.

L. M. M., N. FERRISBURGH, Vt.—When a small boy I watched one season 20 robbins' nests, and only in two or three were the young raised. Having often noticed the conflicts between the robbins and the crows, I concluded that the latter were the cause of the destruction. I found that the ground sparrows and other field birds suffered equally. Would not the little birds that are thus destroyed, if they were allowed to live, have benefited farmers more than the crows? In a short plea for the crows in a late RURAL, we are advised to scatter a little corn for them. Yes, let's do so; but put a little strychnine in it.

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds; it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

Q. WHAT IS THE opinion of standard medical authorities on kidney disease?

A. That the blood vessels and tubes of the kidneys have become paralyzed by repeated and long neglected congestion and, having no nerve power to control their action, the albumen, the life of the blood escapes, while the uric acid and waste remains in and destroy the blood. This sometimes results in dangerous blood poisoning; the only true scientific blood tonic, before which these symptoms and diseases rapidly flee away, is Warner's safe cure.

Improved HYDRAULIC RAMS.
Send for Circular and Price List. Address
ALLEN GAWTHROP, Jr.,
WILMINGTON, DEL.
Awarded Medal and Diploma at the Centennial Exhibition, Philadelphia.

TO FARMERS. This simple invention is used in milking cows, particularly where there is any soreness. Made of solid silver, and sent by mail to any address on receipt of the price, 50 cts. Address The Milking Tube Co., 102 Friendship Street, Providence, R. I.

Macomber's Hand Planter, *for Corn, Beans, and Beet Seed.* The BEST in the world. Money refunded if it does not prove satisfactory, after a fair trial. Agents wanted. Send for circular and terms.
S. M. Macomber & Co., M'f'g's, Grand Isle Vt.
For Rhode Island address L. G. SHERMAN & CO., PROVIDENCE.

But Little Credit to the Profession.

DETROIT, Mich., Nov. 6, 1885.—Three years ago, I suffered much from enlarged prostrate gland. Had to have my water drawn. The more I doctored, the worse I got. Was completely broken down. Almost out of my head. Have used 102 bottles of Warner's safe cure, and am perfectly and entirely relieved.—SOLOMON WESLEY, 354 Grand River Avenue.

Implements and Machinery.

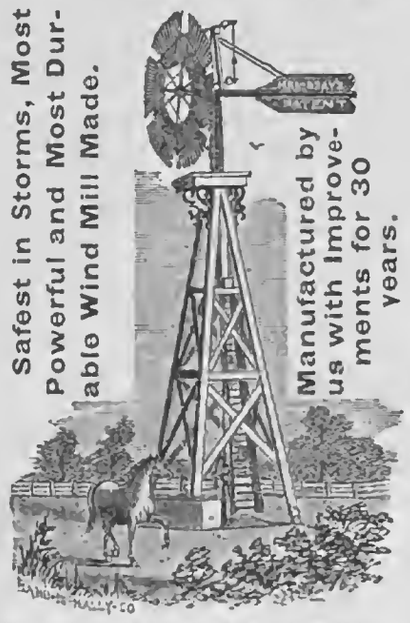
MYER'S FORCE PUMP.
The only double acting Force Pumps with Expansive Plunger Bucket and GLASS VALVE SEAT. The only Successful Drill Well Pump.
Simple, durable, powerful, easy to operate. Never affected by frost.

MYER'S DOUBLE LOCK REVERSIBLE HAY CARRIER

A perfect reversible carrier. New Myer's iron and wood track carriers the simplest carriers made. Double and single harpoon hay forks, pulleys, grapplers, etc. Illustrated catalogue free. F. E. Myers & Bro., Ashland, Ohio.
The best made.

THE OLD RELIABLE HALLADAY
STANDARD WIND MILL.

GUARANTEED THE BEST REGULATING, Safest in Storms, Most Powerful and Most Durable Wind Mill Made. THE BEST IS THE CHEAPEST.



Manufactured by us with Improvements for 30 years.

17 Sizes, 1 to 40 Horse Power; adopted by the U. S. Government and Leading Railroads.
Also the Celebrated **IXL Feed Mill, IXL Stalk Cutter, IXL Sheller, Horse Powers, Wood and Iron Pumps, Tanks, Noyes' Haying Tools, etc.**
For Catalogue and Price List, address
U. S. Wind Engine and Pump Co., Batavia, Ill.

THE DANA
CENTRIFUGAL-GOVERNOR
WINDMILL
Is the best working and most powerful Wind-Engine in the world, because it is the only one which unites the most perfect form of wind-wheel with the most perfect method of regulation. Geared Mills a specialty.
For Descriptive Circulars apply to
THE DANA WINDMILL CO.,
FAIRHAVEN, MASS., U. S. A.

EMPIRE POWER and SEPARATOR
BEST, CHEAPEST and MOST IMPROVED in the market.

We also manufacture Mowers, Reapers, Twine Binders, Rakes, Field Rollers, Plows, Feed Cutter and Crusher, Hand and Power Corn Shellers, etc. Send for Illustrated Catalogue and Price List. **S. S. MESSINGER & SON,** Stockertown, Pa.

THE GRANGER FAMILY FRUIT & VEGETABLE **EVAPORATORS.**

$3.50, $6.00, and $10 00.
Send for Circular. EASTERN M'F'G Co., 268 So. 5th St., Phila., Pa.

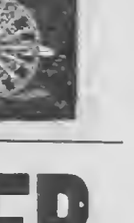
MAST, FOOS & CO.
SPRINGFIELD, O.
Manufacturers of the

THOUSANDS IN USE.

IRON TURBINE WIND ENGINES
Strong and Durable, will not Swell, Shrink, Warp, or Rattle in the Wind.

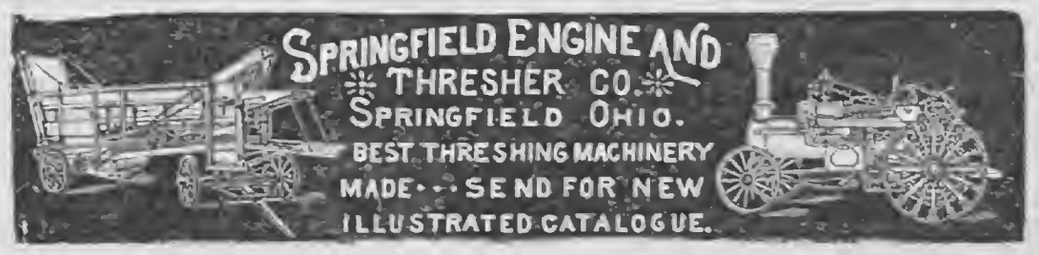
BUCKEYE FORCE PUMP
Works easy and throws a constant stream. Has Porcelain lined and Brass Cylinders. Is easily set. Is the Cheapest and Best Force Pump in the World for Deep or Shallow Wells. Over 90,000 in use. Never freezes in Winter. Send for Circulars and Prices, giving depth of well. Also manufacturers of the **Buckeye Lawn Mower, Buckeye Iron Fence, Buckeye Hose Reel, Lawn Sprinkler, etc., etc.**

A CHILD CAN USE THEM.



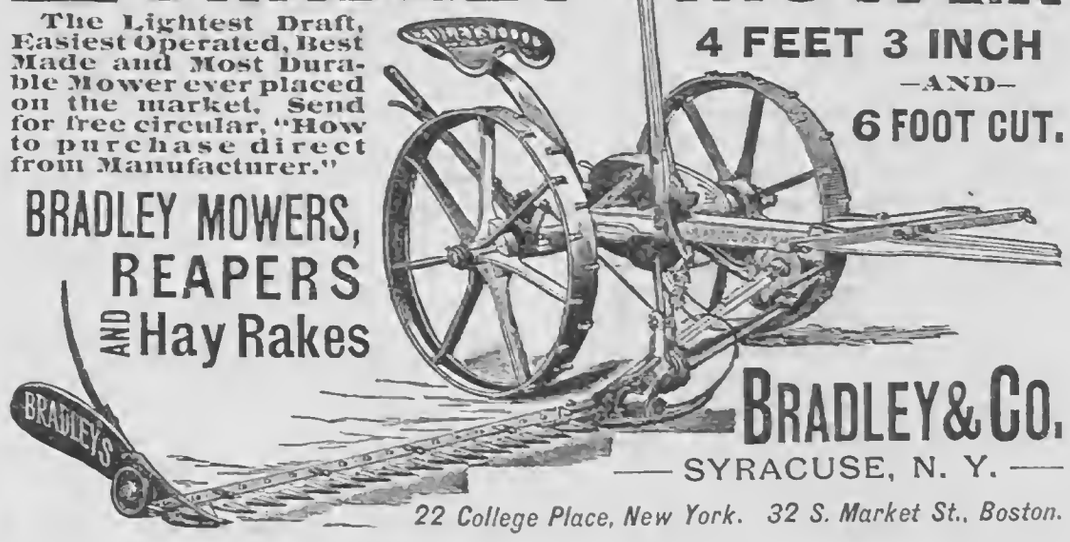
Buy the Best. **THE EUREKA**

Awarded **FIRST Premium and Gold Medal** at World's Fair New Orleans, over 12 leading Wind Mills. The **EUREKA**, after a trial lasting 4 mos. was pronounced the **best over all** and to-day stands at the head of all competitors. Sizes, 10 to 18 ft. diameter of wheel, either for Pumping or Power Mills. *Perfect in all parts and warranted.* Estimates on application. Also Mfrs. of the **Adams Direct Draft Barn Floor Horse Power.** *Live Agents Wanted.* Address Mfrs.,
SMITH & WOODWARD, Kalamazoo, Mich.



THE BRADLEY MOWER

The Lightest Draft, Easiest Operated, Best Made and Most Durable Mower ever placed on the market. Send for free circular, "How to purchase direct from Manufacturer."



4 FEET 3 INCH —AND— 6 FOOT CUT.

BRADLEY MOWERS, REAPERS AND Hay Rakes

THE POULTRY SPECIAL next.

IF the number on your address label is 1892, your subscription expires with this number; if 1893, next week; 1894, in two weeks, etc.

THE Poultry Special will be mailed May 3d—20 pages. The next Special thereafter will be devoted to the crop prospects of the entire country.

TWELVE years ago, as well as we can recall, the first Blue Spruce was planted at the Rural Grounds. Its botanical name, after having been changed several times, is now settled upon as Abies pungens, or, according to the new nomenclature, Picea pungens. Pleased with the gray or steel color of its leaves, with its hardiness and form, we have talked of it in these columns for the past 10 years, every year praising it more highly. It is still a rare tree; but other journals are now discovering its beauty, and there is little doubt that its merits will ultimately insure it a place upon every lawn to the exclusion of the popular, though far less meritorious, Norway Spruce and Balsam Fir.

Again, good readers, forget not that we would beg you to plant Alcock's Spruce which for six years at least, though more persistently of late, we have pressed upon your attention. This is another rare conifer, and, as we have remarked, were we confined to but one evergreen tree, this would be our first choice; while were we confined to two, the Blue Spruce would be selected second.

SEVEN years ago a notorious woman at Paris appeared at a semi-disreputable ball with stuffed birds as ornaments. Since then the feminine beauty, piety, homeliness, vanity and thoughtlessness of Christendom have servilely followed the fashion thus started by a wanton profligate. Entomologists estimate that the annual loss in food and fiber plants due to insect pests, amounts in this country to fully $300,000,000. At the lowest estimate 5,000,000 birds are butchered by us every year to satisfy the demands of a barbarous fashion. It is estimated that the death of every insect-eating bird causes an actual and consequential loss equivalent to four bushels of grain. When the enormous fecundity of insect pests, and the number daily destroyed by their feathered foes are considered, the estimate will not be considered greatly exaggerated. The decrease of birds by ordinary accidents, depredations and mortality, nearly counterbalances their increase; and such special havoc as that made of them for feminine vanity's sake, upsets the balance of Nature, and leads to the speedy extinction of whole species. This is an excellent time to change this fashion inaugurated by vice and maintained by recklessness, cruelty, and vanity. Let the flowers that bloom in the spring-time, take the place of the birds that die the year round.

AN abstract of the anti-oleomargarine bill of the House Committee on Agriculture is given in our news columns. It embodies the suggestions made here last week, with regard to the tax on "oleo," the packages for it, and the giving of a part of the penalty to the informer. These are the cardinal points in a national law. Such a law should contain as few provisions as possible for an effective enactment. With the increase of provisions, the risk of invalidity increases in more than geometrical progression. Let the General Government tax the product, as it undoubtedly has the right to do, and effectually provide for the rigid collection of the tax, branding the packages as it brands or stamps those for whiskey, and let the various States make laws regulating minor details of its sale, as they do in the case of intoxicants. The bill will doubtless be bitterly opposed both in the House and Senate, and no doubt some alterations will be made in it. Introduced at so late a date, and certain of the vigorous and persistent antagonism of concentrated capital, it can be passed only by an equally vigorous and persistent pressure from the people—producers and consumers—on their representatives in Congress. The effectiveness of such pressure was admirably illustrated by the fate of Senator Wilson's postage bill. All can now concentrate this popular pressure on their Congressmen in favor of the Committee on Agriculture's Oleomargarine Bill.

In several States there is a demand for summer Farmers' Institutes. The meetings of the Winter have been remarkably successful. There is a desire to hold these meetings at the time when nature is at her best. In Winter the mistakes or successes of agriculture are hidden away under the snow. In Summer, the story of the year lies spread over the land like an open book. The summer meetings must of necessity be short and practical. The time is too valuable to spend in theorizing or "passing compliments." One fact has been learned from the experience of the past Winter—it pays to advocate mixed husbandry with a mixed programme. In the West the Farmers' Institutes are greatly helped by local literary and musical societies. Music and recitations do much to render the programme attractive. Interest the ladies and the boys and girls by giving them something to do. A company of farmers, each one of whom feels that he knows more than the speaker about the subject under discussion, will not make the ideal Farmers' Institute. Make the programme attractive enough to bring out the crowd; when you get the people in the hall, show them that farming is something beyond a mere hoe exercise.

NOTICE.

THE PRESENTS

FOR SUBSCRIBERS who shall have sent us clubs will be positively awarded May 10th. We think that a pleasant surprise awaits them.

Now that the season of cyclones and tornadoes has fairly opened, would it not be well for those living in regions where these destructive visitations are likely to occur with the greatest violence, to construct "cyclone cellars"? In an emergency such a structure conveniently at hand, would often be the safety of the family, and anyhow its cost would be amply repaid by the reassuring feeling that at the worst one would always have a place of refuge for himself and those dear to him whenever whirling destruction should threaten. During the havoc wrought at St. Cloud, Sauk Rapids and Rice's Station, Minn., a little over a week ago, many who perished would have had ample time to find safety in such places had they existed. A hole in the ground or in a hill-side under or quite close to the dwelling, is what is needed. It should be excavated from an ordinary house cellar so that those in it could not be crushed by falling walls or timbers, as they might easily be in an ordinary cellar. A small brick-lined room excavated from an ordinary cellar, with an arched brick roof some distance beneath the surface of the ground, would be the safest and best protection. Where even remote danger threatens the lives of all that are dear, neither the prospect of a trifling outlay of cash or labor, nor the smallness of the risk, nor the fear of the neighbors' ridicule will deter a prudent man from taking every precaution. Although few such storms occurred last year before August, yet 111 lives are known to have been lost by them. In 1884, in February and March alone, 678 lives were lost by this cause, and in 1883, 509 were lost, the worst storms occurring in April and May.

SMALL-POX and flood-afflicted Montreal held a jubilee Thursday over the news from Ottawa that the Government had reduced the canal tolls to enable grain going to that place for shipment to Europe to compete with that brought from the lakes to this city on the Erie. The reduction is 18 cents a ton on the Welland and 13 cents on the Lachine Canal, leaving the charges only two cents per ton as the through rate, with a local rate of two cents. Goods passing through the Welland are not charged on the Lachine. Montreal merchants think the reduction will enable them to get a large share of the grain trade from our Northwestern States and Territories. Anyhow, the closer competition thus caused will benefit the farmers of the Northwest. Over a year ago the Erie was made "free,"; in last year's canvass, both political parties pledged themselves to improve the State canals; the proposition to obtain a Federal appropriation for the work has met with little encouragement in the State, and it is to be hoped, therefore, that the deepening and widening of these checks to railroad extortion may not be neglected by our lawmakers at Albany. The Erie opens on May 3, and now that the ice is breaking up in the Straits of Mackinaw, allowing free navigation between the Lakes, the largest grain fleet that ever sailed from any port in the world, consisting of 148 vessels loaded with 6,460,000 bushels of grain, has started eastward from Chicago. Of this vast amount of agricultural produce 1,986,000 bushels are wheat and 3,980,000 bushels corn, and 4,689,000 are for Buffalo, the western terminus of the Erie. This grain has been held back chiefly on account of the high railroad charges, and its shipment as soon as water transportation opens is a strong argument in favor of the advantage of water-ways as regulators of freight charges.

THE "POCKET PISTOL".

A WHISKEY saloon in this city bears upon its front what we consider to be a very appropriate sign:—"Take home a pocket pistol of sour mash whiskey." Who but the man engaged in the wretched business of burning up the souls and bodies of his customers could seriously advise the taking of liquor into the home? "Home, Sweet Home" is a mockery to such fellows. They would willingly tear down the purest and tenderest of all safeguards for the sake of adding to the sale of their wretched stuff. There are dumb brutes in this world, who could show more manhood than that. There is something grimly appropriate in this calling a bottle of whiskey a "pocket pistol." Of all cowardly and useless weapons the pistol is the worst. No one but a moral coward or a man going into the most desperate danger would think of carrying one. Yet he who would advise his friends to hang up a loaded revolver in his home would be a safer guide than he who invites his customers to take home a bottle of whiskey. The rum interests are settling upon this land like a black curse. There are few readers of the RURAL who cannot point to some dear relative whose life has been blackened by this wretched evil. If the demons of drink, or barkeepers, have our city governments under their feet, we must fight them in the pure, strong country homes, where in all the world's history the bravest and surest legislation has been formed. See to it that no son or daughter of yours can ever look upon a whiskey seller with any other feeling than they would have in regarding a man afflicted with some loathsome disease.

SPECIAL.

Those who, having applied for the Rural's present seed distribution prior to April 25th, have not yet received it, will kindly notify us by postal at once.

HARDINESS OF SMALL FRUITS.

YEARS of experience scarcely increase our knowledge as to what constitutes *hardiness* in some kinds of plants. The Niagara Grape is uninjured by the past Winter. Duchess within ten feet of it is nearly killed. Next to this (within ten feet) Early Dawn is dead. Next to this Moore's Early and one of Rieketts's Seedlings (240 A.) are unharmed. Then Cayuga is killed to the ground. Brighton is seriously cut back, and Wilder killed. Herbert is killed to within two feet of the ground, Amber Queen killed back one-half, while Woodruff Red is uninjured. On the same trellis the Rural New-Yorker (Marvin) and Jessica have escaped damage. Worden, F. B. Hayes, Cottage, Ulster County Prolific, Lady, Florence, Victoria, Carlotta, Rockingham, Early Victor, Pocklington, Concord and El Dorado are alive to the tips.

It is just as hard to account for the different degrees of injury sustained by raspberries. Superb is uninjured. Next to this variety one bush of Marlboro is badly hurt; in another some of the canes are killed while others are unharmed. All have suffered more or less. Reliance is unharmed, Crimson Beauty very little, Hansell not at all. One bush of Caroline is half-killed, another unharmed. It is the same with Turner. Shaffer's Colossal is hurt but very little, while Souhegan is nearly killed. We are surprised to find that Macomber's white seedling of the Antwerp is very little injured. Rancocas, Imperial (claimed by some to be Crimson Beauty) have escaped injury. Ohio, Earhart and Carman are alive to the tips.

Blackberries have not suffered much. Taylor and Snyder are alive in every part. A few Kittatinny bushes have been killed back a little. Only the tips of Crystal White are dead. It was not supposed this variety would stand our climate. The Lucretia Dewberry is all right, but was somewhat covered with straw. Early Harvest was cut back somewhat. Early Cluster is sound and lively. Wilson Jr. has been injured considerably—more perhaps than any other. Some of the canes, however, are not harmed.

It will appear by a comparison of the above notes with those of last season published at about the same time, that several kinds of grapes and raspberries, which were then reported as having passed the Winter with safety, are now more or less killed back, and *vice versa*. And this piece of history has repeated itself at the Rural Grounds for 12 years, from which the important conclusion may be drawn that "hardiness" is a relative word, and should not be used in a positive sense without caution and experience.

BREVITIES.

Is your early sweet corn planted?

WE estimate this Spring as one week earlier than the average Spring at the Rural Grounds.

MONEY sent in letters for subscriptions to the RURAL NEW-YORKER is at the sender's risk. Our terms are invariably $2.00 a year in advance.

WE have no sympathy for strikers and boycotters who make their head-quarters in beer saloons. The "shackles of slavery" are not "knocked off the souls of men" in any such places.

THE weather is beautiful. Spring has come. Winter has run towards the pole. We are thankful, yet the following seed report from Louisiana makes us thoughtful, "Peas in bloom; corn up; potatoes fine; strawberries ripe!"

PREST. WILDER attributes the comparative ignorance, on the part of the present generation, of many old and good fruits, to the fact that the mania for something new has almost blotted out the recollection of many fine old sorts of much superior merit. A fruit is not good simply because it is new, nor do years of service take away the merits of old fruits. Read the plan suggested in regard to certain new fruits, in another column.

WOULD it be too much trouble to sow in one trench, 33 feet long, two pounds of potato fertilizer, and then at harvest compare the yield of potatoes with 33 feet in which farm manure was used? A third trench might be planted without either fertilizer or manure. Two pounds to 33 feet (if the trenches were three feet apart) would be at the rate of 880 pounds to the acre. We want to say all we can to induce our readers to experiment more. Such little experiments as that suggested above would cost the farmer a mere nothing, while they might prove of great service.

THAT was a sensible act of Gov. Abbet, of New Jersey. Over a week ago he issued a proclamation naming yesterday as Arbor Day. It was represented to him that the day named was Good Friday, and that in some parts of the State the ground was still a trifle unfit for tree-planting, and on Thursday he changed the day to April 30. Gov. Pattison, of Pennsylvania, was less wise, as he stuck to his proclamation naming the middle of April for Arbor Day, though the frost was still in the ground in a good deal of the northern and upland parts of the State. When farmers take official positions, or politicians learn something about agriculture and horticulture, such blunders will be things of the past.

THE industrial growth of the South is exceptionally lively just now. During the first three months of the current year the amount of capital invested there, including stock of new companies, money in mining and manufacturing associations, enlargement of old "plants" and building of new mills, etc., is figured up at $36,557,000, against $21,000,000 for the corresponding period last year. Divided among the States the principal figures are Kentucky $9,648,200; Arkansas, $6,110,000; Virginia, $4,502,500; West Virginia, $3,486,800; Alabama, $3,345,500; Tennessee, $2,324,000; Maryland, $2,215,500; Texas, $1,091,000; North Carolina, $715,200; Louisiana, $579,000, Georgia, $530,000; Florida, $485,000; Mississippi, $135,000; and South Carolina, $90,000. Success to the South and to all other sections!

BRILLIANT Senator Ingalls, of Kansas, has introduced into Congress a bill providing that no person or corporation shall own more than 640 acres of land, and that all held contrary to this limitation after three years shall be forfeited to the Government. Excellent as far as it goes; but it doesn't go far enough. Why not limit the number of horses, cattle, sheep, pigs and poultry to which each shall be entitled? Then, some outrageously rich in this world's goods, actually own as many as a dozen coats, vests and pairs of pants, and twice that number of shirts, white and colored, and a still greater number of pocket-handkerchiefs, collars, cuffs and stockings; while others haven't a decent rag to their backs or feet. Away with all such unequal distribution of this world's goods!! An amendment is in order, brilliant Senator from Kansas.

THERE are a few trees that we delight in calling attention to at this season, when they may be transferred from nursery, field or woods to beautify our own homes. One is the Liquidambar. It is not generally known that, if cut back from year to year, this tree assumes a luxuriance of foliage never seen when it has been left to grow naturally. The branches, also, become covered with the irregular, corky ridges, to an extent never seen in natural trees. The Golden Oak is another tree which for the lawn is much improved by being cut back for a year or so after it has attained the hight of six feet or more. The leaves in early Spring are a pleasing yellow which, though lost in a few weeks, again reappears in early Fall.

Architecture.

A HANDSOME COTTAGE.

At Figs. 187, 188 and 189 we present to our readers plans of a handsome cottage, designed by H. G. Knapp, Architect, 120 Broadway this city. At Fig. 187 is shown the elevation, 30 feet front by 40 feet in depth. Fig. 188 is the plan of the first floor: the parlor is 13 feet 8 inches, by 20 feet 8 inches; dining-room 14 by 15 feet, exclusive of bay window; library 9 by 9 feet; kitchen 11 by 11 feet; hall 14 by 16 feet. Fig. 189 is the second floor. Here the chamber over the parlor is 14 feet 6 inches by 18 feet 6 inches; chamber over dining-room 14 feet 6 inches by 16 feet; chamber over library 7 feet six inches by 11 feet 6 inches; chamber over hall, 10 by 14 feet; bath-room 7 feet 6 inches by 10 feet. There are also three commodious rooms in the attic. The first story is built with brick walls, thence up the construction is frame, with double outer sheathing and back plastering. The exterior finish is, as shown in the sketch, with shingles and clapboards. The house is heated throughout by furnace, and is finished in first-class style, with modern improvements. Its cost will, of course, vary with different localities and circumstances, but should not exceed from $3,500 to $4,000.

Miscellaneous.

SHORT PITHY PARAGRAPHS.

Profit in Farming consists in devoting most of your land to grass and stock; in making large quantities of manure, and applying it to a small portion of cultivated land, giving high cultivation. In this way more grain, roots, etc., will be raised one year with another than can be raised on the whole farm by the usual skimming and half cultivating process. Here is success in a nutshell; your farm and pocket will grow fat: no mistake about it!

Profit in Stock-raising comes from giving the best care and shelter with full feed from the beginning. In breeding use only thoroughbred males; half-breds produce only mongrels and scrubs. One pound of sulphur to 20 of salt will prevent disease, and keep your animals healthy. Always salt the hay in the mow. One is apt to neglect giving salt in Winter. Add sulphur as it prevents hay from molding and keeps it sweet.

Boiled Linseed Oil should be applied to all the wagons, carriages and farm implements at least once a year, especially to the wagon wheels; then the tires will not get loose and they will last five times as long. If the plow or cultivator teeth get rusty, clog and will not scour, apply nitric acid; go right to work and the rust will soon disappear. Boiled linseed oil is the best furniture polish in existence. Try it, see how new and fresh everything will look.

To Paint Fences and out-buildings, use water-lime and skim-milk; mix a small portion at a time; apply with a brush; add any color you wish—a very nice, cheap and durable paint.

Cut-worm ravages in corn or tobacco fields, may be made good by getting a few hundred or thousand two-inch flower pots—price about four dollars per 1,000. When you plant corn, plant at the same time four kernels in each pot, and where a hill is missing, lift a hill out of one of the pots and replace it. Transplanting out of the pots, does not check the growth. The transplanted hills will come right on with the rest. With tobacco, transplant into pots at the time you plant in the field; then fill up from the pots; it is better to start all your tobacco and cabbage plants in pots; they can be transplanted anytime with safety, without checking growth.

For Cabbage Worms use pyrethrum or insect powder, or, what is better, place dishes of sweetened water and vinegar, and catch the millers before the eggs are laid.

To Keep Water Cool and fresh when carried to the field, wrap up the jar in a woolen cloth. It will then keep fresh and cool six hours. Keep the cloth wet.

To Keep off Squash Bugs, place a cob soaked in coal oil by the hill.

To Raise Two Crops on the same ground in one year without exhaustion, in every third row of potatoes, plant every fourth hill to squashes or punpkins; the vines will not bother till after the potatoes have been cultivated; put a shovelful of well rotted manure in the squash hills.

To Avoid Sunstrokes get plenty of sleep; sleep in the morning if possible: don't get out too early while the air is filled with malarial poisons. Sunstrokes do not occur where nights are cool, and people get plenty of sleep to keep up vital force. Be temperate, just and honorable in all things. Haul your manure directly from your horse stable during Winter, and scatter it thinly and evenly over your wheat; this will prevent winter killing, and give the wheat a good send-off next Spring.

Morrow Co., Ohio. C. W. CARPENTER.

CATALOGUES, ETC., RECEIVED.

The Home Acre.—Rev. E. P. Roe, has selected an exceedingly happy title for the series of papers he is writing for Harper's Magazine. The picture he paints of the ideal rural home, is one well calculated to appeal to the heart of the over-worked city man. Those who follow his directions, will surely fence in "an acre of paradise." To our mind these bright, crisp, little articles are as readable and strong as anything in the famous magazine. There is grace of diction, and at the same time an earnestness and practicality about them that leave an admirable impression on the memory. Those who view, on their own tables, fruits and vegetables—the product of their own exercise and thinking—will highly appreciate the idea that those who patronize stalls and peddlers' wagons, can buy but dead and dying things. It's a decidedly happy thought to speak of a light, thin sandy soil as a spend-thrift, that never can be kept rich, no matter how much you give it, or to call a stiff, heavy clay, a miser that hates to part with its stolen fertility. Roots are called levers. It is only when they rest against a deep fertile soil, that they can lift condensed sunshine into our hands. The chapter in the May Harper's, is given up to a talk on the garden portion of the "acre." More than one-half of the space is devoted to the cultivation of the vine. No attempt is made to deal with technical or scientific details, but the reader is told which varieties to procure, how to locate his vineyard, and how to watch and care for it. The articles are just the kind needed to make a city man homesick, and to cause him to long for a real home of his own. This home building, and the idea of drawing men away from the noise and excitement of the city, is the most timely and important subject discussed in the magazine.

The Practical Fruit Grower, by Prof. S. T. Maynard, published by the Phelps Publishing Co., Springfield, Mass.—This little book is designed to help beginners in fruit culture. It will be of great value to those who have no time to study through the whole range of pomological literature, and yet desire to master the rudiments of the science. It is evident that such a book is needed. No department of the farm needs to be stirred up and improved as does fruit culture. The ordinary farmer cannot and will not be induced to read long articles full of scientific terms and matters of interest only to professional fruit-growers. This book ought to be in the hands of every farmer in the country. The farms and homes would be better off for such a distribution. Nearly one-half is properly given up to the apple. Its value, origin, propagation, how to market, how to graft, its insect enemies, etc., etc., are all briefly treated. The blackberry, cherry, currant, grape, gooseberry, plum, quince, raspberry, strawberry, pear and peach are all described and treated. The illustrations are frequent and timely. Among other articles we notice one on Fruits for the Cold North, by Dr. Hoskins, which appeared in the Rural last year. Send for the book. Price, 25 cents.

Kemp's Manure Spreader. Catalogue from the Kemp & Burpee Manufacturing Co., Syracuse, N. Y.—Machines for preparing the soil for a crop, or for securing the crop at the end of its life, are plentiful. Those for applying fertilizers, giving the crop its life, are few. The manure pit is truly the farmer's bank. We need machines for properly handling and conserving manures, for farm manure will long continue to be the chief fertilizing element on the majority of farms. No machine has, of late years, given more universal satisfaction, in its peculiar field, than Kemp's Manure Spreader. The more offensive and laborious work is, the greater is the pleasure in discovering a machine that will take away hand labor. The principle of the machine is that of a substantial cart or wagon with broad-tired wheels, the floor of which is a revolving apron, operated by suitable gearing or machinery, and when machinery is in gear, the apron moves to the rear, carrying its load in contact with a swiftly revolving toothed roller that picks the material finely to pieces and scatters it uniformly over the land, broadcast or in drills, as fast as the team moves along, nearly doubling the value of the manure by pulverizing and evenly spreading. The speed of apron or floor is so accurately controllable that we may put out a heavy or a light coat as may be desired without paying any attention to the speed of team, the farmer knowing just the amount he is using without measuring his field or manure pile. The machine will give satisfaction. Send for the catalogue and study it.

Halladay's Standard Pumping and Geared Wind-Mills.—Catalogue from the U. S. Wind Engine and Pump Co., Batavia, Ills. No intelligent man in this age thinks of questioning the fact that wind power is practical and cheap. For pumping water on stock and dairy farms, for irrigation and other uses, a good wind power is hard to excel as a cheap yet powerful agent for work. The vast amount of labor spent at hand pumping water for stock, might be employed with much greater profit at other work, if the wind could be made to do the pumping. The object of this catalogue is to show the good points of the Halladay Wind-Mill, and to prove that it is the best one made. It is certain that the special advantages of the machine are tersely and strongly described, and that no one can read the few pages of description without understanding why it is expected to do good work. The catalogue will set many a farmer to thinking about the unnecessary labor he has performed at the pump handle. The pictures on the cover well illustrate the difference between "old-time" agriculture and farming of the present day. On the one hand a farmer is lifting water from his well with an old-fashioned sweep. Near-by the remainder of the family are laboriously pitching hay with hand forks. On the other page a beautiful Halladay wind-mill raises water for the stock, while the load of hay is being unloaded by means of hay carriers at comparatively little expense of labor. The catalogue should be read by every farmer.

Whitman Agricultural Company.—Catalogue from the above firm, located at St. Louis, Mo.—A pamphlet of 110 pages in which more than 100 machines are illustrated and described. The hay presses, corn shellers, feed mills, horse powers, cider mills, feed cutters, road scrapers, etc., etc., which are made by this house are so well known that it seems like a "twice told tale" to call attention to them. We are confident that any of the implements described in this pamphlet will give good satisfaction. The many medals and prizes which the machines have won at fairs and other exhibitions, were given for genuine merit. Farming has improved so rapidly of late that a good outfit of machinery is an absolute necessity to those who farm for business. We can do no better than to advise those of our friends who desire to invest in new machinery to send for this catalogue and study it carefully.

Clapp Wagon Co., Auburn, N. Y.—An illustrated circular and price list of the farm, freight, lumber, coal, and business wagons made by this well-known firm. The illustration show the leading kinds. Superiority to other wagons is claimed in many ways. The axles are uniform and exact, so that the spoke stands precisely plumb. The spokes are made of the best quality of White Oak butts. The ironing is smoother, of a better finish, the irons being rolled from the best quality of scrap and forged to form by heavy power drops in solid pieces. The tires are placed in a revolving furnace and subjected to a heat which is uniform and so regulated that no injury is done to the felloes by burning in setting the tire. An equal and uniform dish is secured. The company invites a careful comparison of its wagons with others by personal inspection. The circular will be sent to all applicants.

Mark's Artificial Limbs. From A. A. Marks 701 Broadway, New York.—This book is an argument, if such a term may be allowed, in favor of artificial limbs; that is, it shows how easily such limbs may be secured and how comparatively comfortable they are. It is well known that artificial eyes and teeth can be made so true to nature as to deceive even a close observer; but it is quite surprising to know that there are persons in our midst, wearing artificial legs and arms, who

very seldom betray their unpleasant secret. This book is interesting and well written. Such a work would be incomplete without the old song "The Cork Leg," a parody on which is given in full. We hope none of our readers will ever have the misfortune to lose a limb. Should they be so unfortunate, we can only hope they may secure as comfortable a substitute as those described in this book.

BUCKEYE IRON FENCING.—Pamphlet from Mast, Foos & Co., Springfield, Ohio. Iron fencing becomes more popular with each year. Its use is not by any means confined to cities. Iron crestings, railings, verandas, window guards, vases, hitching posts, etc., are largely in use. The Buckeye fence is constructed of extra heavy and strong materials. It is shipped in panels so that it may be set up without trouble. Twenty-two different styles are shown, from the plain and simple picket fence to the elaborated and highly ornamented panel. The wrought iron used in this fence is made specially to order, while the malleable iron used for ornamenting is from the best air furnace iron. In addition to the fencing, the Iron Turbine Wind-Mill, Buckeye Lawn Mowers, and Buckeye Force Pumps are described in the catalogue.

STEARNS' STANDARD FERTILIZERS. Circular from Stearns & Co., 149 Front St., New York.—The reasons why farmers should use these fertilizers are tersely given. Many good testimonials are printed. With the information that stares from the pages of fertilizer pamphlets, farmers ought to know something about agricultural chemistry by this time. The catalogue contains many valuable tables of facts and figures, and will be sent free to applicants.

For Women.

CONDUCTED BY MISS RAY CLARK.

ELIAKIM GRAVES'S WOOING.

PART I.

"MOTHER, I have resolved to marry!" and having made this unexpected communication in the short, abrupt manner so peculiarly his own, Eliakim Graves reached up and placed the Doddridge's Expositor he had been reading on the mantel-shelf, and sitting yet more erect in his straight high-backed chair, gazed solemnly into the fire.

The Widow Graves, a little, wiry, black-eyed woman, sitting opposite in another high-backed chair, started as though a bombshell had exploded in the quiet room, dropping three stitches in the striped mitten she was knitting. Pushing her iron-bowed spectacles high up on her wrinkled forehead, she looked at her son with a swift, sudden doubt of his sanity, chilling her heart and exclaimed:

"For the land's sake, Eliakim! What under the sun, moon and stars ever put that idee into your head that you should want to bring some creature here to upset us all with new-fangled ways and notions?" And then as though fearing she had perhaps unconsciously failed in motherly care and devotion, added half appealingly, "Don't I make you comfortable, my boy?"

"Yes mother," replied Eliakim, "I am comfortable. But you are getting old. The Bible says 'it is not good for man to be alone.' I am used to your ways. I desire to bring a woman here that you may teach her so that when you are gone there may be no change." And Eliakim Graves's gaze wandered around the room. Each article of furniture stood in precisely the same place which it had occupied in all the forty and two years of his life. The narrow-leaf table between the two west windows, the chest of drawers with their brass rings, opposite. The high-rounding bed with curtains of large flowered chints, the spindle-legged stand at the southeast corner of the huge fire-place with the big Bible on it, the blue-dye pot, in the southwest corner, and the little crock containing the batter for the buckwheat cakes on the mantel. These were the household gods he had worshipped in his childhood, revered all his life, and it would go hard with him to see them cast down from their thrones or desecrated by careless hands.

"And the woman—who is she?" questioned his mother.

"I have made no selection," replied Eliakim. "The Lord will undoubtedly direct me." And taking off his home-spun coat, he hung it upon its accustomed peg, and mounted the creaking stairs which led to the room above. Here he was wont to stretch his angular six-feet frame upon an orthodox bed of genuine live geese feathers, which had softened the slumbers of several generations of his honest upright ancestors. From the tiny window of this room, he could look out upon every acre of the well tilled farm, which by virtue of being an only child, had come into his possession of his father. Eliakim Graves was a worthy descendent of the old Puritan stock, stern, rigid, strict in the performance of all religious duties, he "kept the letter of the law," although he missed much of the sweetness pertaining to the Christian faith. He had succeeded his father to the office of deacon in the church, and was always at his post at all times and in all weather. Never, in all his life, had there been the least indication to warrant the supposition that Eliakim had thoughts of matrimony. Consequently to his mother, whose fears of being supplanted in her son's affections, had long years ago subsided, the revelation was most startling. With Eliakim, to resolve, was to act; and straightway he began to weigh the merits of the various single ladies of his acquaintance. Finally, all things considered, his choice fell upon Miss Desire Hopkins, as the one most suitable to occupy the position he proposed to offer.

Miss Hopkins was a spinster of some 35 years, a healthy, plump, brown-eyed, little body, tidy and neat, with always a cheerful smile and a pleasant word, and a communicant in the church with which he was connected. She was a tailoress by trade, industrious and economical withal, to which excellencies of character the neat little sum, counting up into the hundreds which had been from time to time accumulating in the village bank, bore testimony. Another item which had great weight with the Deacon was, that Desire Hopkins was alone in the world For, he reasoned, "many a man's nose has been kept constantly on the grindstone by the lengthy and oft-repeated visits of a numerous tribe of relatives."

It was in the petulant month of April that we picked up the thread out of which to weave our little story, and gentle May had well nigh reached the end of her flowery journey, when Eliakim Graves selected a Thursday evening on which to pay the object of his choice a visit. He was far too strict a disciplinarian to take a Saturday or Sunday evening for such a worldly purpose. He intended to make her a point blank offer, as he considered time spent in courting worse than wasted. Besides, he wished to have the matter settled before the busy harvest season. The frequent dwelling of his thoughts upon the various virtues and attractions of the lady, had started a little, feeble flicker of affection in his heart which was to eventually burst forth in a roaring, all-consuming flame.

Desire was at this time engaged in the house of Brother Drake, getting ready the summer plumage for the father Drake and the large brood of ducklings. The distance was about three miles by the public highway, but Eliakim proposed to shorten it by taking a cut "cross lots."

Now, although our hero was strictly honest, and to a certain degree charitable, he was also exceedingly saving — "parsimonious," some called him. He aimed to make things last as long as possible, hence, while about his work looks were of small importance. He followed his plow and drag bare-footed, in warm weather, and hoed his corn and raked his hay in the same simple and childlike costume. And on this momentous evening, after arraying himself in his carefully preserved "Sunday best," he took his shoes in his hand with the intention of putting them on when near his destination. His way led through a piece of woods, and as the moon was not yet up, he received several bumps and scratches. At last he ran into the slivered stub of an old oak tree and hurt his great toe. "Oh, the dogs!" he exclaimed, with a groan, as he hobbled to a grassy knoll there to sit down and nurse the bleeding member. "It's Providential I didn't have my shoe on. I should, in all probability, have knocked a hole in it."

MY VISIT TO THE CITY.

HARVEST and the fruit season brought extra work: I was tired and really needed a little change. "Oh," I thought, as I sat upon the step of my vine-draped piazza, "In the city there's breadth and life mentally—music, lectures, church privileges; in the country its work, work, and nothing else."

"To-morrow, Sally, you shall go to the city for a long visit with Cousin Mary," said my husband, as he sat down beside me, heated and perspiring; even the beautiful moonlight caught him working at something.

Next morning I went to Cousin Mary's, who lived in the suburbs of a large city 20 miles from our farm. Tom packed a basket and put it in the baggage car, in spite of my objections.

"Why Tom, you forget that they live in a place of plenty; beefsteak, oysters, fine fruits, ice cream, etc. I don't care to take butter and pickled pork to Mary."

But Tom had his way, and that afternoon found me in the pretty little parlor, chatting to Mary, who was looking more worn out than myself.

Mary's dress was cheap and plain, she seemed her old bright self, though she sighed often, as I told her of my summer's work.

"How thankful you should be Sally, that your lines are cast in such pleasant places."

"I! thankful Mary? For what? Hard work and mental starvation?"

"I mean that you should be thankful for mental rest and the knowledge that you have a home and a comfortable support secured."

"You have more Mary, and leisure to enjoy life as it flies. I can not but contrast the lives of city and country women, in favor of the former."

"Sally, Sally! do you know that hundreds of mechanics, clerks and laborer's wives are almost beside themselves from worry; fearing want in different forms? I have spent hours casting about in some way to help Will. Our home is not paid for and we are about to lose it all. We try to be economical, and have dispensed with articles which really were needed. We have had so much company; persons who visited us just because it was convenient; they praised my cooking, and thought how nice it was to live in the city amidst such plenty, not dreaming, we could illy afford to buy beefsteak and fresh fruits for them. We lack only a few dollars upon this last payment, but it seems as though we never can get them. Now don't think I mean you dear Sally, I need you to talk with, and cheer me in these gloomy times. you cannot know how much I appreciated Tom's basket of good things, and the thoughtful heart which prompted the act. I've been so tired of the struggle and have longed in the spring time to come to you. Suppose you do work hard, there's a beautiful picture spread before you, done in nature's coloring; green fields, sweet, fragrant blossoms white and pink; if you are tired or sick you can take time to "rest." Life isn't one hard, daily grind from early morn until late in the night."

"But the concerts and lectures in the city!" said I.

"Poor men's wives are usually too far away to attend evening amusements, or too tired, and if they are ambitious to dress well, they cannot afford to spend the money for amusements. Church-going is never neglected by me, as on Sunday I gain fresh strength for the coming week's struggle. Sally, the country woman with a good home and husband ought to be the happiest woman in this great, glad, wide world."

I started back home after making my visit, ashamed of my murmurings and dissatisfied spirit. I had a good home and a good husband; one who did all in his power to make me happy and content. I took up my work again with a light heart, resolved never to allow myself to envy another's position in life, but to keep my home as neat and cheery as was possible. ELLA GUERNSEY.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOUSEKEEPING IN CALIFORNIA—VI.

MARY WAGER-FISHER.

SINCE writing my last "Housekeeping Letter" I have attended an Art Reception in San Francisco, where I was so charmed with the decorations that I cannot let the opportunity pass without making a note of them for the RURAL. The occasion was in honor of a ladies' exhibition of pictures—the work of California women—and the decorative effect of the rooms was, of course, due to women. I was told that the arrangements were chiefly due to a lady who was a decorative artist; but that she did not paint pictures. She had the faculty of taking an old worn-out basket and converting it into a "thing of beauty." The materials made use of were old shawls of crêpe and silk, Roman scarfs, bits of gay silks and ribbons, dried and fresh grasses and stalks of grain, dried seed-pods of many kinds, including dock, which is a rich, dark maroon in color; branches of orange and Japanese persimmon loaded with red and yellow fruit, ferns and branches of the pepper tree, door-high; coarse baskets hung on the wall filled with grasses, peacock feathers, old-fashioned and new-fashioned bowls on brackets, or suspended from hooks filled with chrysanthemums, roses, or gay marigolds, with long, down-hanging clusters, formed by tying bunches of the flowers close together—called Makart bouquets, I believe. Not a really expensive article was used—only what often is to be found in an attic and its chests; but so grouped and arranged as to produce a wonderfully fine effect.

The door-way leading into the supper room was draped about the top on both sides, pendent wreaths of orange-colored flowers falling against dark maroon drapery on the inner side, while on the outer lichen-grown twigs and branches revealed their delicate tracery against loopings of silk shawl. Over the mirrors disposed about the room and those on the side boards, were hung boughs of golden fruit, which were reflected in the glass. The refreshments were very simple, but so daintily served as to enhance their value—lemonade in tiny glass cups with handles—one slice of peeled, seedless lemon served in each glass; ice cream with small round cakes about as large as a half dollar, and some kind of punch, I believe. Unless one has the gift to see and appropriate the beauties in field and wood, it is a lesson in decoration to see what can be accomplished with the very things that are ordinarily ignored. It is quite worth one's while—particularly when one gives entertainments—takes down the beds and turns the whole house in so many connecting rooms for a "great party," to lay in a stock of grasses grains, and some of the multitudinous spikes and stalks of vegetation that Nature herself often so beautifully dries for interior decorations. How well brilliant-hued apples would adhere to branches cut off and hung up to dry, I do not know, but berries often dry on stalks and in clusters, which are decorative and raspberries at that. Grasses and flowers artificially dyed, are never pretty, and it should not be forgotten that there is beauty of form as well as of color, that dried golden rod and boughs or cones are not to be despised for their lack of brilliancy. Of course, in an exhibition of this kind, there was much decorative work—painted china, screens and mirror frames. The prettiest decorated frame, to my taste, was a profusion of pink roses on a black-ground—the wide frame being black, with an outside border of dull gilt—a succession of knobs like large nail heads. The roses were nearly alike in color, but differed in variety and were painted from all points of view.

I was in a large Japanese store one day, where screens were being painted by Japanese, sprawled on the floor, with the screens lying flat down—they work like the Indians, without seats. Two of the Japanese "artists" were painting portraits from photographs of San Francisco women on the screens, and covering the upright figure with a Japanese gown in gorgeous colors. For a screen portrait gotten up in this fashion $30 were charged. In the way of photography, the Japanese do wonderful work, and color the photographs with equal skill and taste, quite surpassing any American work that I have ever seen. They make rain coats of a material resembling broom corn, overlapping the "broom" on a quilted lining, as feathers overlap on a fowl, and over this is fastened a gauzy netting, which holds it in place.

Christmas week was rainy, but gay—stacks of shapely evergreens for Christmas trees, bunches of holly, Christmas and New Year's cakes, and plum puddings, boiled in England and sent over in sealed packages to be steamed here, and served piping hot. The Germans are very fond of cake on New Year's, and often send an elaborately decorated one to a friend. California is full of foreigners—Germans, Portuguese, Japanese, Chinese, French, English and European peasants. The Germans are very thrifty and oust Americans from business. The Chinese excel the Germans in industry and economy, and in turn oust them in a way, and the sons of the Fatherland howl wildly over the sharp rivalry. It was our second Christmas away from home, and the laddie was wondering as before if Santa Claus would know where to find him! He had been hoping for a bag full of oranges, but as at Christmastide three dozen oranges cost but 25 cents, he concluded it was hardly worth while for S. C. to burden himself with them, and I suggested a lag of obedience instead, and for several days, what a bag of obedience would do was much discussed.

WOOLEN SUMMER GOWNS.

E. L. TAPLIN.

THOUGH the pretty cotton and muslin frocks before described may be worn for the most part through the summer months, there are many cool days in this erratic climate of ours which make some light stuff gowns an absolute necessity. Again, such a gown would be required for traveling, or for driving on the dusty country roads. Suitable materials are plentiful enough. We should eschew cashmere, unless we were selecting a black gown for an elderly woman. Cashmere is not at all a fashionable material now, except in mourning, unless it is an expensive grade of this material used in a combination suit. This Spring light qualities of homespun are much worn, but for a general utility costume we would advise either camel's hair or pressed flannel. For a young girl, nothing could be prettier than the ever-useful navy-blue flannel. Lighter colors in flannel are rarely pretty, excepting only cream or ivory white. Light shades in camel's hair are both pretty and serviceable, as this material sheds dust, but light shades must be selected with great care, or they are not becoming. Though fawn and gray are becoming to most people, it must be the right fawn and the right gray. A clear and decided gray may be worn by most florid people; but if there is the slightest suspicion of yellow in the complexion, the gray must have a leaning toward fawn, like mastic or putty color.

A camel's-hair summer suit may be made

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria,

of the one goods, or trimmed with a little velvet of a darker shade. For one who expects to make her suit do duty several seasons, it is always more prudent to make up the goods alone, leaving any further embellishments until it is made over. The new gown requires only good workmanship to make it attractive, whereas a made-over garment often needs more elaborate trimming to hide signs of wear.

Suppose we decide on a fawn camel's-hair as our ideal summer costume. We should buy eight yards of the material as it is double width. If we decide on having a loose wrap to match, for spring and fall wear, we should buy two yards extra.

The bodice would be very short in the back, with little tails, instead of having a lot of fullness in the tails made into pleats, the center seam might be left open to the waist, the bodice being faced up to the waist with the material. If the wearer inclined to *embonpoint*, the front of the basque might slope down to be a little longer than the back, jacket-fashion. Even if front and back are of the same lengths, the full back drapery makes the back appear much shorter. This basque would be very pretty with a diagonal flap sloping from the shoulder towards the waist, ornamented with a row of large buttons. Of course, these large buttons do not really fasten the basque; it requires one set of small, flat buttons in the usual place, beneath the flap and another row of invisible buttons or hooks to fasten the flap. If the wearer is not particularly plump, or, better still, if she happens to be narrow-shouldered, those military cords looped across the breast, with epaulette on the left shoulder, will be very becoming. It is always a mistake for a very plump woman to wear a much trimmed bodice, while a slim or undeveloped figure must be corrected with pleats, folds or braids. In making the skirt we must remember that little, cut-up trimmings are out of date; large, graceful folds and flowing draperies are fashionably as well as aesthetically correct.

Though genuine, uncompromising hoop-skirts are not worn, fashionable women are now wearing large and often exaggerated back drapery, the skirt being held out by steel springs. These springs come in sets of three; the shorter one is 12 or 14 inches from the waist, slipped into a band of the lining across the back breadth; the two others, graduated in size, go beneath at the same distance from each other as the first is from the top. They are held into a bow shape by tapes. Back drapery this Spring has just the same long, pointed form that obtained two Winters ago, hanging down perfectly straight on one side and pleated up on the other. At the top it is pleated in very deep, straight side pleats into a space of about eight inches. This draping sets out very full over the springs, and is extremely graceful. The bottom of the skirt might be finished by a fine knife-pleating only two inches deep.

We have a very wide latitude in selecting our front drapery, but whatever it is, it should not unnecessarily cut up the stuff; we must always keep before us the possibility of making over the gown. We might have a pointed drapery, similar to that in the back, the straight side being at the right, and covering the underskirt to the back seam. The left side, looped high, should come under a box-pleated panel 12 inches wide at the bottom, sloping to half that width at the top. The side of the panel towards the front should be trimmed with a row of large buttons, similar to those on the basque.

This same style may be made in flannel for a young girl, while a little taste and study may vary the draping indefinitely. If the wearer feels that the light color unrelieved is not becoming, it may be varied by putting collar, cuffs, diagonal flap, and, if desired, the panel on the skirt, of dark velvet. Dark brown on fawn, or black on gray, dark-blue, myrtle-green or wine color on either, would be very effective.

Navy-blue flannel for a young girl is most effective trimmed with black or white Hercules braid; this costume with a Harvard hat of dark blue rough straw, trimmed with gulls wings, is very picturesque and becoming, while its durability makes it most desirable for all sorts of picnics, excursions, and all the summer amusements of a country life.

MODERN MIRRORS.

The pretty deeply beveled modern mirrors can be framed handsomely and inexpensively at home. The broad flat frames can be covered in almost any material, and decorated in every variety and style. They can be made in cheap white wood and ebonized, or in ash, or stained wood and painted in oils. An extremely handsome one is made of polished pine, with a design of birds in flight scattered over the frame, while one with upraised wings seemed to be poised lightly on the glass itself. In order to paint upon glass, trace the design with a lithographers pencil, and carry it out in oil colors. Sprays of ferns, tendrils, berries and falling blossoms begun upon the frame, may be carried across the mirror with the most charming results. In decorating with oil paints, it is necessary to have old, well-seasoned wood. When a covering is prefered there is scarcely a limit to the material suitable for the purpose. A most effective background for flower-painting, is white velvet. Plush, satin and satin de Lyon, are all used. The mirrors which are generally perfectly square, are hung from one corner, so that the design should accord with this position.

Chicago. MRS. A. J. ALLIS.

WINDOW PLANTS.

AUNT EM. writes as to her success with house plants: "A cyclamen which was given me last November, has bloomed constantly; a box of yellow oxalis has cheered us with its delicately perfumed flowers. A fire-cracker plant which I took up last Fall, never even wilted, but has blossomed profusely ever since. Several of my begonias have bloomed all Winter, and a carnation has rewarded my care with its sweet flowers, but I believe the gem of my collection is a plant of Kenilworth Ivy. It has completely hidden the pot, drooping below the shelf, and is covered with tiny lilac flowers."

DOMESTIC RECIPES.

VEAL LOAF.

Two pounds of veal, scant one-fourth of a pound of pork, two eggs, one-half cup of sage tea, two-and-one-half cups of bread-crumbs and nutmeg, salt, pepper, butter and gravy or water. Make into a loaf, cover with bread-crumbs. Bake one-and-one-half hour, basting often.

SPANISH BUNS.

One pint of sugar, one scant pint of flour, one cup of sweet milk, one-half cup of butter, four eggs, one teaspoonful of soda, two of cream-of-tartar, one of cinnamon, nutmeg and cloves. Bake in square tins. Cut in two inch squares when done, and frost the top and sides of each piece with cooked frosting.

CREAM PUFFS.

One cup of hot water, one-half cup of butter. Boil water and butter together and stir in a cupful of dry flour while boiling; when cool add three eggs not beaten. Mix well and drop by the spoonful on buttered tins. Bake in a quick oven 25 minutes. This makes 15 puffs.

CREAM FOR THE PUFFS.

One cup of milk, one-half cup of sugar, one egg, three tablespoonfuls of flour, beat egg and sugar together, add the flour and stir into the milk while boiling. Flavor when cool. When the puffs are cool fill with cream.

LEMONADE ICE.

To a quart of lemonade add the whites of six eggs beaten to a froth, and freeze. M.

DOUGHNUTS AND COOKIES WITHOUT EGGS.

The rule for doughnuts given in the RURAL of April 5 seems all wrong. A little cream added to my rule—just a little—sometimes ruins the whole by making them soak fat, and even my buttermilk is too rich to be used for doughnuts, so how can anyone fry them when a cup of cream and butter-milk, too, enters into the composition of them? The following old and tried recipes may be useful in time of a scarcity of eggs to those who think they can not make anything good without them.

CREAM COOKIES.

One cup of thick, sour cream, one cup of sugar, one teaspoonful of soda, one teaspoonful of salt, flavor to taste; add as little flour as will make it possible to roll, cut out and bake.

DOUGHNUTS.

One cup of sweet milk, one cup of sugar, one small teaspoonful of soda, and one of salt; grate in a little nutmeg; flour sufficient to roll; fry in hot lard. These will not "soak fat." S. E. H.

PREPARATORY TO HOUSE-CLEANING.

SPRING work will soon commence in earnest, both in-doors and out, and I think that a great help to this work is to plan ahead and prepare for it. Anticipate house-cleaning by taking a day now and then and overhaul trunks and closets and find out what garments put away in them through the Winter are worth making over and altering. Put these by themselves, then sort over those which might be useful to some poor person, and lastly those only fit for rags. AUNT EM.

TO CLEAN A NURSING BOTTLE.

I always found it hard to keep baby's nursing bottle sweet until I began to use stale tea leaves and it makes them clear as crystal and removes every particle of milk with very little labor. Put a few leaves in the water, pour into the bottle, shake, then rinse out with clear water. Put the rubbers in salt and water to sweeten them. I never use the tubes as I do not consider them safe for the baby's health.

TEA MUFFINS.

One egg, one-half cup of sugar, shortening the size of an egg, one quart of flour, one-half teaspoonful of salt, two teaspoonfuls of baking powder wet with milk. Bake in a hot oven in muffin rings for about 20 minutes. They are very nice. P. A. M.

Miscellaneous Advertising.

Catarrh

Is frequently an indication of a Scrofulous taint in the system. Ayer's Sarsaparilla purifies the blood, and thus restores health to the affected membranes. It also stops the nauseous catarrhal discharges, and prevents the infection from reaching the lungs and stomach. Catarrh should be treated as a blood disease.

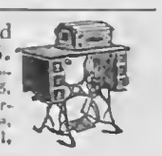
I suffered for years from chronic Catarrh. My appetite was very poor, and I felt miserably. None of the remedies I took afforded me any relief until I commenced using Ayer's Sarsaparilla, of which I have now taken five bottles. The catarrh has disappeared, and I am growing strong and stout; my appetite has returned, and my health is fully restored.—Susan L. W. Cook, 909 Albany st., Boston Highlands, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

AN UNNATURAL shortness of breath, with unusual disposition to pluerisy and bronchial affection, indicate that the blood is full of uric acid poison, which can be removed through the kidneys by means of Warner's safe cure.

12 DOLLARS each for *New* and *Perfect* SEWING MACHINES. Warranted five years. Sent on trial if desired. Buy direct and save $15 to $35. Organs given as premiums. Write for FREE circular with 1000 testimonials from every state. GEO. PAYNE & CO., 47 3rd Ave, Chicago, Ill.



THE "COMMON SENSE" MILK PAIL.

This is the only *perfect* Pail made. There are no seams in the front to catch the dirt. It has a perfectly fitting strainer, which can be instantly removed, so that every part of the pail may be *quickly* and *thoroughly* cleaned. Should the strainer become foul or worn with use, we can furnish new ones at very little expense. The Pail is well made of heavy XX tin, and we offer it to the farmer at the very lowest price at which a really good article can be sold. *Send for special circulars.* Price **$1.25** each. Discount to the Trade.

MILKING TUBES,

FOR MILKING COWS WITH SORE TEATS

This is the best Tube in the market. Sent, post paid, to any address on receipt of price. One Tube, 25 Cents. Five Tubes, $1.00. Send for special Circulars.

Send us your name and address and we will mail you, FREE, our

Seed Catalogue for 1886.

Choice New England Seeds. The very Best and Purest Stocks of Cabbage, Onion, Beet, Parsnip, &c. All grown by ourselves and sure to give complete satisfaction. TRY THEM.

BARTLETT & DOW,

LOWELL, MASS.

Please mention this paper.

An Ex-Lt. Governor's Successful Risk.

SYRACUSE, N. Y., Jan. 1st, 1884.—Three years ago I felt tired and worn out. Had nausea, occasional retchings, sense of weight and fullness in the lower part of the body. Feverish, hot and chilled. Seemed to be giving out. Unable to obtain relief. Determined to take my case in my own hands. Used Warner's safe cure. Am completely restored to health. Nothing like it for diseases incident to declining years.—T. G. ALVORD, Ex-State Lieut.-Gov.

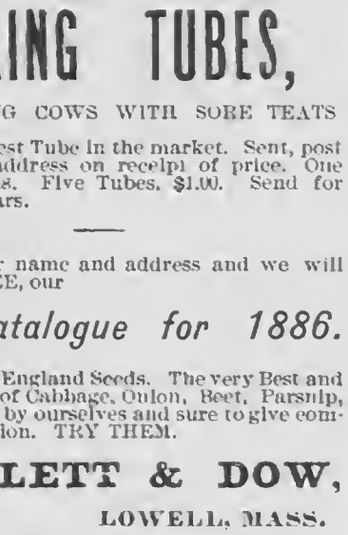
ELEGANT SHAPE, HEALTH and COMFORT

Perfectly Combined in

MADAME FOY'S

Skirt Supporting

CORSET.



It is one of the most popular and satisfactory in the market. For sale by all leading dealers.

Price by mail $1.30.

FOY, HARMON & CHADWICK, New Haven, Conn.

ALLEGER ORGANS you can get a strictly first class organ from $50 to $75, stool and book. Warranted 5 years. It will pay to send for circular before you buy. Address the manufacturer. **H. W. ALLEGER, Washington, New Jersey.**

† Over and above a 4 per cent. reserve on existing policies of that class.

THE SEVEN ADVANTAGES

OF THE

NEW YORK LIFE INSURANCE COMPANY'S

Nonforfeiting-Tontine Limited-Endowment Policy.

FIRST ADVANTAGE.—Insurance for a definite amount, or for an amount increasing with each premium paid, as desired.

SECOND ADVANTAGE.—A Definite Cash Endowment, and a Tontine Dividend, to Policies in force at the end of Endowment and Tontine periods, which periods correspond, and may be either Ten, Fifteen or Twenty Years.

THIRD ADVANTAGE.—Insurance for the full amount of the Policy, extended for as long a time as the value of the Policy will carry it, within the Endowment period, in case of discontinuance of payment of premiums after three years.

FOURTH ADVANTAGE.—A Grace of one month in the payment of premiums, during which time the policy-holder's security is unimpaired.

FIFTH ADVANTAGE.—Three valuable options, including cash value to policy holders who survive their Tontine and Endowment periods and keep their policies in force.

SIXTH ADVANTAGE.—Practical freedom of action with respect to occupation, residence and travel.

SEVENTH ADVANTAGE.—The payment of death-claims immediately upon the approval of the required proofs of death.

Do not insure until you have seen full particulars of this Policy. Do not fail to write the nearest Agent, or the Home Office, for such particulars—**at once**. The NEW-YORK LIFE INSURANCE COMPANY, **346 & 348** Broadway, New York City.

News of the Week.

HOME NEWS.

SATURDAY, April 24, 1886.

STRONG agitation starting in New York State in favor of a Prohibitory Constitutional Amendment. Tuesday a resolution in favor of it was ordered to a third reading in the Assembly by a vote of 61 to 36. Six Republicans and five Democrats were absent. All Democrats present voted against it except Wood, of Wayne; 13 Republicans voted against it—Berry, of Fulton; Binder, Windolph and Charles Smith, of New York; Dennis and Dickson, of Rensselaer; Donald, of Saratoga; Gallagher and Kraus, of Erie; O'Brien, of Albany; Pratt, of Monroe; Storm, of Dutchess—the rest for it. At least five more votes for it wanted—no one knows where they are to come from.....Very exciting Prohibition agitation in W. Va..... For the second time a jury trying Gen. Alex. Shaler, in this city, for accepting a bribe of $9,000 for using his influence in selecting a site for a military armory costing nearly $250,000, disagreed—four "guilty;" eight "not guilty." Hardly likely to be tried again..... ....The House has refused to name a day for the consideration of the Hennipen Canal bill—hardly likely to pass, therefore, at this session, if ever. Late exposures show a rise of 628 feet in 186 miles, requiring a multitude of locks; route now considered "one of the worst."..... .....The partnership of Cleveland & Folsom is now considered certain in June. He 48; she 23.....A reservoir dam burst near East Lee, Mass.—13 persons drowned by the flood; much farming and town property swept away.....The first train from ocean to ocean, on the Canadian Pacific Railway, will be sent off May 24—the Queen's birthday .....Lamar's visit to Macon, Ga., is said to have been entirely social—nothing matrimonial about it.....Last Sunday conversation over ordinary telegraph lines, by means of the Turnbull long-distance telephone, was "fair" between New York and Chicago, over 1,020 miles of wire; and "perfectly free" between N. Y. and Cleveland, Ohio, over 631 miles of wire.....The first list of killed and wounded by that Minn. cyclone was mixed up; here is the correct account, after the dead have all been found, and the agony of excitement has abated: Killed at St. Cloud, 21, wounded, 80; killed at Sank Rapids, 39, wounded, 100; killed at Rice's Station, 15, wounded, 33. Total, killed, 72, injured, 213. Property destroyed, $300,000. Several other deaths and injuries were inflicted in country places along the track of the cyclone..... .....The opponents of the Morrison-Hewitt Tariff bill claim all the 139 Republicans in the House will vote against it, except White, Wakefield and Nelson of Minn., as that State is strongly for "free-trade;" of the Democratic votes they claim 11 from Ohio, 7 from N. Y., 6 from Pa., 3 from La., 2 from N. J., and one each from Cal., Md., and W. Va., making, in all, 32. Deducting these from the 183 Democrats vote, and adding the three Republicans and Weaver, Greenback-Democrat, there will be 155 for, against 169 against—139 Republicans, 32 Democrats and Brumm of Pa.. Greenback-Republican. It is thought that the passage of the bill would be the beginning of the breaking down of the entire protective system. .....Canada is negotiating with the Imperial Government for power to make her own commercial treaties.....All the lower part of unfortunate Montreal, along the St. Lawrence, was flooded for nearly a week before Wednesday last, owing to a solid ice blockade of the river which caused the heaviest backwater flood ever known. Water often 10 feet deep in some of the chief business streets. Losses estimated all the way from $2,000,000 to $3,000,000. Much distress among poor and working classes compulsorily idle as all manufacture and business had to stop..... ....The strikes in the country are more aggravated than at this time last week, there being at least 43,000 strikers reported among the bituminous coal miners, chiefly in Pennsylvania: the railways, chiefly on the Gould system; the textile, boot and shoe trades, chiefly in New England, and miscellaneous strikes of bricklayers, masons, carpenters, musicians, street-car drivers and conductors etc, etc. On April 16th the number "out" was estimated at 31,000. In addition to this great number voluntarily idle; the National Labor Bureau estimates the number compulsorily idle through lack of work, injuries or diseases of workmen, at fully 1,000,000..... The increase is chiefly among street railroad, sewing machine and miscellaneous industrial employees. Over in Brooklyn 5,000 employees in the great sugar refineries are on a tumultuous strike. Refined sugar has gone up one cent a pound in consequence. There is also an advance at New Orleans and San Francisco of from 5-16 to ¾ cent respectively. Raw sugar has felt none of the advance. The strike on the Gould system still drags on. Powderly before the Congressional Committee investigating the trouble, swears the Knights of Labor do not number over 500,000. Other labor organizations in the country, however, have an aggregate membership of over 2,250,000, and the vast bulk of these give sympathy and help to the K. of L. Of these not over 9,000 are "out" on the "Gould system." Money is flowing in upon the managers in St. Louis at the rate of over $10,000 a day just now, from all over this country, Canada and even Europe. The aggregate of a multitude of small contributions is wonderful, and, then, who hasn't marveled at the generosity of the poor!..... ....Occasional tumults chiefly in St. Louis, East St. Louis, and large towns on the various roads; no systematic violence: "dogged obstinacy" on part of the "bands;" "resolute determination" on the part of the "bosses," "More than the usual number of trains running, and doing more than the usual amount of business," say the latter. "Short trains and half-empty cars," say the former. Much of the freight for the "system" roads goes by competing lines where possible. Wages of new hands high, and work inferior. Likely the strike will "petter out" slowly. Boycotting the road and its managers begun. Men striking in works that supply the "system" with goods.....Big strike of switchmen at Chicago on the Lake Shore Road just compromised: freight cars running again after a tie-up of nearly a week..... .....E. Remington & Sons, Ilion, N. Y., have failed.....Yarmouth, N. S, is sending bait to Eastport, Me., where it "eagerly bought" by American fishermen who are not not allowed to buy it in any port of of the Dominion..... ....Complaints grow louder of the suspicious dilatoriness of the House Judiciary Committee to take any action with regard anti-polygamy legislation. Until action is taken, the Senate's Anti-polygamy Bill rests in "innocuous desuetude." There's a rich and handsome male and female Mormon lobby in Washington..... ....The House has appointed a Labor Investigating Committee to find out the "cause of the unrest and disturbance which now exists in the country." It has just been examining Powderly and other prominent labor chiefs, and Gould and Hopkins of the "Gould system. The President has sent to Congress a special message on the subject..... John Bigelow, the American representative at De Lesseps' late Canal "Convention" at Panama, says it is impossible to tell when the canal will be finished or what it will cost. Labor scarce; 90 cents a day at the start, now $2.50, with that of white mechanics at $5.00. Country terribly unhealthy. Tasks ahead not impracticable, but difficult and expensive. A "wet-blanket" report. De Lesseps cables it is "absurd," and that the canal, at sea level, will be opened from Gulf to ocean in 1889..... Col. Cozzens, father of Phœbe, has been continued by the President as U. S. Marshal at St. Louis, in spite of the urgent protests of hungry spoilsmen. Mostly his smart lawyer daughter's work.....A strong opposition against Senator Edmunds is developing in Vermont, because he is supposed to have been lukewarm in the Blaine campaign..... Evidence taken by an Ohio legislative committee goes strongly to prove that the election of H. B. Payne, as U. S. Senator, in January, 1884, was secured by bribing some of the State legislators by strong Payne men—but, of course, the bribe money wasn't theirs. Payne is one of the brighest lights of the Standard Oil Company and a several-times millionaire..... .....Ex-Lieutenant-Governor Pichback, of Louisiana; ex-Congressman; ex-representative of the colored race; ex-Collector at New Orleans; etc., etc., and always a "lucky" hand at poker, has been admitted to the New Orleans bar at the age of 50.....Natural gas for manufacturing purposes is coming into extensive use. All manufacturing towns in and near the Pennsylvania well regions use it, and it is being piped and pumped to distant places. Cleveland, Toledo and even Detroit now think they must have it.....A reduction of 267 clerks in the U. S. Treasury, saving $232,000 a year, since March 4, 1885..... It seems likely the Senate will compromise on "open sessions," by making public everything except the speeches.....The "Educational Bill" is likely to be smothered in the House Committee by the Democrats.....Congress has voted itself a very expensive new library. The cost will be known only after years when the building is completed.....A part of the Libby Prison at Richmond, Va., occupied by the Southern Fertilizer Co., collapsed, Thursday, "from overburdened floors."..... Tuesday in municipal elections in Illinois, "licence" and "high licence" against "no licence" or "prohibition," were successful in most of the large towns; and "no licence" in most of the small places.....The Canadian Government intends to extend the volunteer militia organization to the Northwest Territory.....A bill granting the right of way to an adjunct of the Northern Pacific Railroad through the northern part of the National Yellowstone Park, has received the unanimous recommendation of the House Committee on Public Lands on the pretext of building a road to the Clark's Forks mines. The mine to which the railroad really wants access is, not Clark's Forks, but the broad expanse of Yellowstone Park.....

AGRICULTURAL NEWS.

SATURDAY, April 24, 1886.

THE following is the gist of the anti-oleo bill to be pressed by the House Committee on Agriculture, as a substitute for all the others. It defines "butter" as the product exclusively of milk or cream, or both, and "oleomargarine as oleo, oleomargarine-oil, butterine, lardine, suine and neutral, etc. It imposes a special tax of $600, on manufacturers of "oleomargarine;" $450 on wholesale dealers; and $48 on retailers, and imposes a fine of $1,000 to $5,000 on all manufacturers; $500 to $2,500 on all wholesalers; and $50 to 500 on all retailers, who neglect to pay the especial tax. The manufacture must be conducted under surveillance of the Commissioner of Internal Revenue. "Oleo" must be packed in new wooden packages, "marked, stamped and branded," and containing not less than 10 pounds. Retailers must sell only from the original stamped packages in quantities not over 10 pounds, and shall put it in marked wooden packages under penalty of not less than $100, or more than $1,000, with imprisonment of not less than six months, or more than two years. Under penalty of $50 manufacturers must label every package with the name of the manufacturer. A tax of 10 cents a pound must be paid by the manufacturer, and a part of a pound is taxed as a pound. All imported "oleo" has to pay an additional 10 cents a pound. The Commissioner of Internal Revenue is to appoint analytical chemists and microscopists, to enable him to determine what is to be taxed, and his decision is final. He is also to determine whether any "oleo" is injurious to public health, but an appeal lies to the Surgeons-General of the Army and Navy, and the Commissioner of Agriculture. Any person willfully removing or effacing the brands, etc, on the packages, is to be fined $100 to $2,000, and be imprisoned from 10 days to six months. "Oleo" exported is not to be taxed; but packages must bear, in half-inch letters, the word "Oleomargarine." All fines and forfeitures may be recovered in any court of competent jurisdiction, and half the fine or penalty, when paid, is to go to the informer..... The N. Y. Senate voted unanimously, Tuesday, to investigate Dairy Commissioner Brown, who challenges investigation.....N. J. and Conn., have lately passed stringent anti-oleo laws. The former is to have a Dairy Commissioner with a salary of $2,000 a year; the latter, one drawing $1,500..... .....Stone, Secretary of the Chicago Board of Trade, completed his annual report, Tuesday. It shows that the receipts of grain for the year amounted to 132,200,000 bushels, as against 137,200,000 bushels for the year ending 1884, and reducing flour to wheat, the receipts were 156,408,228 bushels as against 159,561,474 bushels, showing a decrease of 3,153,246 bushels. The number of cattle received for the year is 1,905,718; of hogs 6,937,535, and of sheep 1,003,598, showing in the aggregate an increase over the corresponding figures of the year 1884 of 1,875,587.....A convention of the viticulturists of the U. S., according to a "call" issued in February, will be held at the Dep't of Agriculture's buildings at Washington, opening May 18, and continuing four days. There will be a fine exhibition of fruit. All exhibits from east of the Rockies should be addressed to Charles Vander, 909 Seventh St., Northwest, Washington, D. C. A number of interesting addresses by prominent men will be made. It will be quite an interesting and instructive convention for grape-growers..... .....Constance S., the famous Holstein heifer of the "Record Farm" herd, Philadelphia, died on April 21 of rupture of the stomach. She was owned by William H. Singerly, of The Philadelphia Record, and was valued at $5,000. Her record of 83 pounds of milk in one day has never been equaled by any two-year-old.. About 300 Montana stock growers, representing over 3,000,000 cattle and $125,000,000, made Miles City, Montana, lively early in the week. They favor rigid precautions to keep contagious diseases out of the Territory, and a liberal National appropriation for stamping them out. About 25,000 cattle will be shipped from Washington Territory and Oregon into Montana this season, against 40,000 last year. Decrease due to advance of prices on the Pacific Coast. Shipments east from Montana estimated at 125,000 head. A strong movement under way to make St. Paul's, Minn., the great live-stock market for the extreme Northwest.

Crops & Markets.

SATURDAY, April 24, 1886.

The Chicago Farmer's Review's report on the condition and prospects of the winter wheat is summarized as follows:—The growing winter wheat enters the second of the spring months under conditions scarcely if ever better. Kansas appears destined to have nearly a repetition of the short crop of last year. Only two of the counties embodied in the latest report make favorable returns. In Michigan many of the fields are looking brown and dead, but there is still promise of a fair average yield in that State. The reports from the remaining winter wheat States are uniformly good. On the Pacific Coast the prospect is that not to exceed five per cent. of the acreage sown in the Fall, but will show that it has passed through the Winter safely, with the additional prospect of a full average yield.

The Cincinnati Price Current says: "If the present area is approximately 25,000,000 acres in winter wheat, and the average condition equal to a prospective yield of 11½ bushels, the outlook may be formulated into an indication of a crop of 287,500,000 bushels of winter wheat. Favorable conditions through to harvest may enlarge this to fully 305,000,000. A favorable season for the spring crop will mean approximately 150,000,000 bushels. The chances for the entire crop now may be measured as from 425,000,000 to 450,000,000 bushels." All estimates, for some weeks yet, cannot be much better than guess-work, and we can make better use of this space than by filling it with even the briefest abstracts of the multitude of such estimates that are sure to appear. Our own full report will be in ample time for all useful purposes.

In all our home markets wheat has gone up considerably during the week, the rise amounting here to 1¾ cent a bushel for No. 2 Red, and to from two cents to three cents at Minneapolis for Spring. In other markets and other grades the difference has varied. It has been due chiefly to a large increase of export demands; reports of possible, or rather not improbable, hostilities in Europe; notable decrease in the visible supply, and speculation. Receipts of wheat at Minneapolis increased over 100,000 bushels during the week. At Duluth grain is coming in with a rush in anticipation of the opening of navigation. As soon as Lake Superior opens there will be a great clearance. The Minneapolis mills produced 110,600 barrels of flour and shipped 102,000 barrels last week. Seeding in the Northwest is progressing rapidly and will be well advanced in another week—only a slight variation in acreage probable from last year's area.

With the rise in wheat corn has become firmer. Last week the decrease in the visible supply was 1,252,839 bushels. The uncertainty of railroad freight traffic has made the market dull, and decreased the supply. Prices of oats are tending upward, and holders are quite firm. Stocks in sight fell off 448,830 bushels last week, owing mostly to the causes that affected corn.

Large supplies of all kinds of butter, especially of choice creamery, have broken this market and lowered prices in others. Reports of more to come add to the depression. Holders refuse no decent offer. Export trade light.

In the cheese market there has been new make on offer with a fair outlook for an immediate increased make. Exporters are acting very cautiously, with easier feeling all round.

Wool is weaker; reports make it one cent lower than a week ago, in some parts of the country. The trade is pretty sure to be dull until the new clip comes into market. Wool dealers are, of course, now using "bear" talk, as their chief aim at present is to get this year's clip at the lowest possible price. Having accomplished this, they will talk "bullishly," to sell at the highest possible price to the manufacturers. The latter are buying with the utmost caution—just enough to satisfy present requirements. The uncertainty of labor, and the fear of strikes among their hands add to their usual caution.

A slight cold, if neglected, often attacks the lungs. BROWN'S BRONCHIAL TROCHES give sure and immediate relief. *Sold only in boxes.* Price 25cts.—*Adv.*

MARKETS BY TELEGRAPH.

SATURDAY, April 24, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 3¾c. higher; No. 2 Spring, 3¼c. higher. Corn, ⅜c. higher. Oats, ⅞c. higher. Pork, 10c. lower. Cattle, somewhat higher. Hogs, from 5c. to 20c. lower, averaging about 15c. Sheep, 25c. to 50c. lower.

ANY KNOWN RECEIPT, TEN CENTS.
W. H. KENNEY, Box 175, GORDON, NEB.

To the Kainit Trade.

ROBERT S. CARR,
Admiralit Ætstrasse 52.
TELEGRAMM-ADDRESSE.....ROBERT CARR.

HAMBURG, 1st of January, 1886.

The undersigned has the honor to inform all those interested in the KAINIT TRADE that he has been appointed by the STASSFURT SYNDICATE OF KAINIT WORKS, consisting of KŒNIGLICH PREUSSISCHES SALZWERK, STASSFURT, (The Royal Prussian Saltmine); HERZOGL. ANHALT. SALZWERK, LEOPOLDSHALL, (The Ducal Anhalt Saltmine); SALZBERGWERK NEU-STASSFURT, LOHDERBURG, (The Saltmine New Stassfurt); KALIWERKE ASCHERSLEBEN, GEWERKSCHAFT, ASCHERSLEBEN, (The Kaliworks Aschersleben), as their SOLE AGENT for the sale of this article to the United States of North America and Canada. As such, any orders will be carefully and promptly executed at the shortest notice and lowest possible current cost.

The demand for Kainit is steadily increasing, and the agricultural public, in becoming more acquainted therewith, is rapidly realizing the fact that the small cost of the article (it is the cheapest article for agricultural purposes) compares favorably with the results arrived at. As a standard Kainit is guaranteed to contain no less than 23 per cent. Sulphate of Potash and assuring all importers of the greatest care in executing orders entrusted to the undersigned, he is always ready to quote by cable or letter in reply to inquiries made direct or through his agents. Representatives for Baltimore; Messrs. PRIOR & VON COLLEN, 25 S. Gay Street, Baltimore. **ROBERT S CARR.**

PEARSON'S FERTILIZERS.

High Grade. Reliable. Lasting.

Manufactured in dry condition, thereby assuring full weight of fertilizing material. Most flattering results where used side by side with other preparations. Where there are no agents for these Fertilizers, orders direct to the manufacturers will receive prompt attention. **JOHN M. PEARSON, Hudson, N. Y.**

BAUCH & SONS, 20 S. Del. Ave. Philada. Pa

LINSEED MEAL.

ABSOLUTELY THE BEST FEED FOR

CATTLE, HORSES, **CALVES,** SHEEP AND HOGS.

This Meal is the product of pure sound Flaxseed. Linseed being its other name, and is the most nutritious of all feed, because it contains the largest proportion of nitrogenous substance.

It is almost needless to say that, in order to derive much benefit from the use of Linseed Meal, it must be fed in quantity. At least one-half of all an animal consumes may safely and profitably be LINSEED MEAL.

☞Please send in a sample order or for circular and prices. Orders will be promptly filled by any one of the following parties:

Cleveland Linseed Oil Co., Cleveland, Ohio.
Toledo Linseed Oil Co., Toledo, Ohio.
Detroit Linseed Oil Co., Detroit, Michigan.
I. P. Evans & Co., Indianapolis, Ind.
St. Paul Linseed Oil Co., St. Paul, Minn.
Cincinnati Linseed Oil Co., Cincinnati, Ohio.

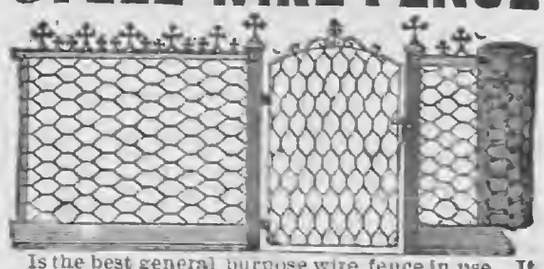
SEDGWICK STEEL WIRE FENCE



Is the best general purpose wire fence in use. It is a **strong net-work without barbs.** Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is **better than boards or barbed wire** in every respect. The **Sedgwick Gates** made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working **all-iron automatic or self-opening gate,** and the **neatest cheap iron fences now made.** The **best Wire Stretchers, Cutting Pliers** and **Post Augers.** For prices and particulars ask Hardware Dealers, or address, mentioning paper,

For the Young.

CLINTON CHILLED PLOW.

Now examine these three words carefully. They contain just 18 letters. The letters are divided as follows: *c* 2; *l* 4; *i* 2; *n* 2; *t* 1; *o* 2; *h* 1; *e* 1; *d* 1; *p* 1; *w* 1. After making sure that these numbers are correct, read the following letter.

DEAR UNCLE MARK:

We are interested in your boys and want to set them to thinking a little, and at the same time make one of them a present. We will give one of our new Iron Beam Plows, complete, to the boy under 16 years of age, who will send in the greatest number of words formed from the letters contained in Clinton Chilled Plow. The plow will be delivered free on board cars at this place. It will be worth its weight in silver. We hope the boys will make things lively with the dictionary and plow out all the words they can find. D. WOODWARD & SON.

Clinton, Michigan.

Now boys, here is a good chance for you. The plow will be given June 1, so you have a good chance to hunt up words. We will take Webster's dictionary as the standard. Each list must be sent to me before June 1, with the name of the boy who composed it. I am not going to say that father or mother must certify that they have not helped in the work. I have confidence enough in my boys to know that they will be honest in the matter. I am going to include the girls in this offer too. To be sure they won't have much use for a plow—I hope none of our girls will ever have to do such hard work as plowing—still, girls are pretty smart at spelling, and they will all have some one who will use the plow for them. If any girl wants to help her brother and will let me know before the lists are sent in, I will count all the words they may make together. It is understood though, that the girls are to have full credit for all the words they make up. Now then, all put on your thinking caps and go to work. Boys, don't let the girls beat you. Girls, show the boys that though they can use a plow, it will take a girl to win it.

One of the Cousins writes to ask what Uncle Mark thinks about temperance. I could answer that quickly enough if I could only find words strong enough to tell how I hate liquor and liquor selling. To my mind there is nothing so dreadful in this world, as the thought of a person deliberately tearing out his brain. That is what a drunken man does. Whenever I see a drunken man, I never feel like laughing at him. No one could laugh at a man who cuts off his hand, yet how much more dreadful it is to dull the mind and spoil the brain. I never could see how any man or boy who had any regard for his mother or sisters could drink. I would rather hear that my boys were dead, than to learn that they were drunkards. That is just what I think about temperance, boys, and I wish every one of you could feel the same way.

I notice a great many little girls in the city "jumping rope" as I go home. No doubt many of our girls are doing the same thing. It is good exercise. I like to see strong girls with red cheeks, and bright eyes. The trouble with such exercise lies in carrying it too far. We want to jump a greater number of times than anybody else has done, and the first we know the head begins to get dizzy, and the side begins to ache. Always stop in time, even if somebody beats you. By keeping strong and well, you can beat them in time.

I suppose some of our boys are playing base-ball. I must say I like that game. I believe I could pitch such a curved ball that most of you would strike out. Let me give you base-ball boys a word of caution though. Don't ever get so interested in the game that you can't get it out of your mind. Many a good lesson, and many a fine piece of work have been spoiled by the memory of a base ball match. It is exciting, I know boys, but don't let the excitement run away with you. There are very few people who can make a living at playing ball. It is far more honorable to saw wood for a living.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: Is there room in the circle for another little niece? If there is, I would like to crowd in. I am nine years old. I have two big brothers and a little baby brother. The baby's name is Ernest, and he has dark blue eyes and nice dark hair. We live on a farm of 55 acres and have five horses, four cows and some young cattle and sheep. We have a pair of twin steers. Their names are Blaine and Logan. They are just exactly alike, only Blaine is a little the larger. My Papa cut 55 loads of hay last Summer and we had lots of corn and oats and wheat. I have a canary and two cats. One of the cats is 11 years old and weighs 11 pounds. He took care of me when I was a baby, or at least he thought he did. He is yellow and white, and his name is Zooterzer. We call him Zooty, except when he is doing wrong, then we speak his full name and he lays his ears back and stops right off. The other cat is leather color, and we call him The Preacher. He has but one eye. My Papa told me a year ago that if I was a good girl and helped Mamma all I could, he would get me a nice organ for my tenth birthday; and I am trying hard for it. I sweep and wash dishes and set table and take care of my little brother. But then, I would help all I could without the promise. EVA LENA WAITE.

Brunswick, Ohio.

[That's right; never try to be good just because of a promised reward. Be good for the sake of being good. I hope you will get the organ though. Those steers are well named. I wish I could see them. That name is about enough to frighten any cat. I knew a boy once named Shearjabub Smith. That Preacher is to be pitied I think.—U. M.]

DEAR UNCLE MARK: I wrote once before and it was not published, but I thought I would try it again. I want to join the Y. H. C. if you will let me. Last year I planted a pint of peanuts and got about a half bushel of shells, but half were false. I planted 20 hills of Netted Gem Cantaloupes and sold $3 worth from them. I have a scroll saw and make things to sell and have sold enough to pay for the saw and more too. We have 16 lambs and one is as black as jet. Peach trees are in bloom. I am 12 years old and work on the farm some. I have one brother. One of your nephews.

ABRAM H. PRINCE.

Henderson, Vance Co., N. C.

[I am glad you were not discouraged. You are getting to be quite a business man. I hope there is no "black sheep" in our family. —U. M.]

DEAR UNCLE MARK: I am a girl of 11 years old. My father and mother are living. I have two sisters and one brother. We have a lot of little lambs. We have a dog and a cat and lots of chickens. We have two cows and two calves. I would like to join the Y. H. C. I go to school at Spring Valley and I am in the Fifth Reader. I like to go to school very much. We have two pigs; one is black and the other one is white. I have a sheep and lamb and a bantam hen. She is very tame. We have a little dog; his name is Prince, and a cat; his name is Jocko. I have four pigeons, they are very nice. We have a large pond. We catch fish in Summer and it is very pleasant. I have never been to New York yet; but I am going in the Summer, if nothing happens. I would like to go very much. We have plenty of pears and apples in the Summer. I had a little black kitten, but it died. I was very sorry. My sister gave me a doll for my New Year. I like it very much. My mother gave me a writing desk and my brother gave me a little trunk. I keep my doll's clothes in the trunk.

Papa has received the Rural seeds you sent him, and he is going to plant them. The flower seeds I am going to plant. We have no flowers. We have three turkeys. I do not like turkeys very much. I was at Ocean Grove last Summer with Papa. I think it is a very nice place. I have been to Coney Island too, but I do not like it as well as Ocean Grove. I live at Saddle River.

GERTRUDE VAN BUSKIRK.

[We all like turkeys at Thanksgiving. Hope the flowers will do well.—U. M.]

DEAR UNCLE MARK: I have been intending to write to you a long time, but always felt shy about it. I am a little girl 11 years old and I have two little brothers; one is 5½ years old and the other is three. We raised a great many Plymouth Rocks last year. I have five little chickens just hatched and expect a great many more soon. I have a pet dog and his name is Tip. I had two, but the cat killed one. I received a package of your seeds and am going to make a garden soon, and I am going to try to get your prize. I have six Pekin ducks, and I get four eggs every day. We have a fine beach and we go in bathing in the summer time. Mamma teaches us at home and I read in the Fourth Reader. Papa has a large crop of cabbage, 10 acres of spinach, 10 acres of kale 12 acres of blackberries, 15 acres of strawberries, one acre of lettuce, an acre-and-a-half of onions, and is planting 25 barrels of Irish potatoes.

Good-bye. Yours truly,
Sewells Pt., Va., EVA G. KIRKHAM.

[You musn't feel shy about writing to me. That was a bad cat. Your Papa will raise vegetables enough for the whole Club, I guess.—U. M.]

Miscellaneous Advertising.

LOTTA—PHILADELPHIA'S FAVORITE.

It was always a marvel to the amusement loving public how Lotta could be so sick that the Chestnut St. Opera House, Philadelphia, was compelled to be closed for one week, about two years ago, and that at the end of that time she was well enough to resume her play of "Nitouche." More than this it was noticed that her voice had acquired fresh volume, and in "Nitouche," which is a singing play, she could be heard ensemble as well as in solo. Among all the gifted ladies who adorn the stage Lotta is decidedly the pet and favorite. Her intense vitality, her beauty, and the versatility of her talents draw all classes to see her. She has been on the stage since her eigth year and in all that time the breath of scandal has never once assailed her. She is a phenominally devoted child to her mother, in whose society she is found at all times. Can it be wondered at that this little lady returned so soon to her labor at the Opera House, when we remember that this speedy restoration was due to the inhalation of Compound Oxygen? A press correspondent writes: "It was at the residence of Mrs. James H. Heverin, of Delancy Place, (wife of the eminent counsellor) that I obtained a brief interview with Lotta in reference to the treatment of Drs. Starkey & Palen, which prevented her a great pecuniary loss. The little comedienne was spending the day there, and as she answered my card she came bounding into the parlor, throwing herself into a luxurious arm-chair, and as soon as the formalities of a visit were complied with, I at once broached my subject.

"I hear you have tried Compound Oxygen treatment, Lotta?"

"Oh, yes! You remember the terrible sore throat I had two years ago—that it baffled the skill of my New York physicians? After burning my throat and positively prohibiting my appearance before an audience for unlimited time, I was promised great things if I would try the "Oxygen" so I immediately came to Philadelphia and put myself under the care of Drs. Starkey & Palen."

"Did you experience relief immediately?"

"It was evident from the first inhalation that I had done the right thing, for it seemed to bring the whole trouble under immediate control."

"Then you do not favor burning the throat or any of the methods usually resorted to?"

"No. I think it a harsh and cruel treatment and it cannot be long before Compound Oxygen will come to the rescue of all the profession."

"Drs. Starkey & Palen claim that the health obtained by the Compound Oxygen treatment is as genuine and permanent as one's original health. Does your experience confirm that opinion?"

"Yes, it most certainly does. I have not been sick an hour since I used the Oxygen. My mother has also been greatly benifited by the use of the Oxygen and is as great an enthusiast as I. It seems to invigorate the whole constitution and imparts fresh life to every part of the body. In my profession I am always studying from nature. I observe the expressions, gestures and ways of the various people with whom I meet, and find that my power of observation has grown more acute and discriminating since my treatment with the Oxygen. In the voice alone there is a most perceptible gain. Long and sustained notes have become easy and whether talking or singing I find it now no labor. Persons who sing or talk much on stage or platform feel a certain amount of exhaustion at the end of the season and to them the use of the Compound Oxygen would be of great value. I wonder these gentlemen have not brought it to the notice of the acting profession before. It is just what we all need."

"Do you think it would have the same effect on the system as change of climate?"

"Yes, and without the disadvantages of long journeys in pursuit of health, such as the loss of home comforts and the interference with regular business pursuits."

"Did you have any unpleasant sensations while taking the Oxygen?"

"No, on the contrary, the sensations were pleasant."

"Do you give your full consent to make this public?"

"I certainly do. You are at liberty to say I said so."

Miss Lotta is one of the busiest little ladies in the world. Her engagements are continuously requiring her presence in the cities each season. She owns theatres and real estate in America and Europe, and large tracts of wooded land in the Northwest, indeed she is one of the wealthiest ladies of the stage. Lotta is modest about her own merits. She believes the test of talent is public appreciation. Surely no one has passed this test with greater eclat than this gifted lady, who is still young and fresh. Now if the Compound Oxygen can bring back to the stage each year this favorite and pet, in prime health, the public can but thank Drs. Starkey & Palen. Any who may desire to know more of the treatment of which so kindly words are spoken, should write to the office of the physicians, 1529 Arch St, for the literature on the subject, which is mailed free to all applicants.

A GRADUAL FAILURE of strength, with extreme pallor of face, fullness under the eyes, prostration, swelling of ankles and legs, indicate unmistakably a deranged condition of the kidneys, which should remove all this water from the system; if they do not, you certainly need the great kidney specific, Warner's safe cure.

PILES. Instant relief. Final cure in 10 days, and never returns. No purge, no salve, no suppository. Sufferers will learn of a simple remedy, free, by addressing C. J. MASON, 78 Nassau Street, N. Y.

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.

THE DINGEE & CONARD CO'S BEAUTIFUL EVER-BLOOMING ROSES

Our Great Specialty is growing and distributing ROSES. We have all the latest novelties and finest standard sorts, in different sizes and prices to suit all wants. Over 450 *choicest varieties* to choose from. We send strong Pot Roses safely by mail to all Post Offices, purchaser's choice of varieties, all labeled, 3 TO 12 PLANTS $1. $8 to $15 per Hundred, according to value. Two year Roses by express. Our New Guide, 78 pages, elegantly illustrated, Free. Address THE DINGEE & CONARD CO., Rose Growers, West Grove, Chester Co. Pa.

"MICHIGAN."

This Seedling originated in Washtenaw County, Michigan, by H. C. Clark, is a prolific, vigorous, blight-resisting variety, of floury texture, and delicacy of flavor unexcelled by any other variety. Season, medium late.

Planted alongside of ten other varieties this past Season where four-fifths of them rotted, there was no sign of blight or rot with it. Price, $1.00 per pound by mail, post paid; by express or freight, at purchaser's expense, ¼ peck $2.00, peck $3.00, ½ bushel $5.00, bushel $8.00. Send all orders to H. C. CLARK, Lock Box 95, Ann Arbor, Mich.

600 ACRES. 13 GREENHOUSES. TREES AND PLANTS

We offer for the Spring Trade a large and fine stock of every description of Fruit and Ornamental Trees, Shrubs, Roses, Vines, Small Fruits, Hedge Plants, Fruit Tree Seedlings and Forest Tree Seedlings. Priced Catalogue, Spring 1886, mailed free on application. Address, BLOOMINGTON (PHŒNIX) NURSERY. Established 1852. BLOOMINGTON, ILL.

FOR SALE. The largest and most complete assortment of Nursery Stock in New England. Orders will receive prompt attention. Address STEPHEN HOYT'S SONS, NEW CANAAN, CONN.

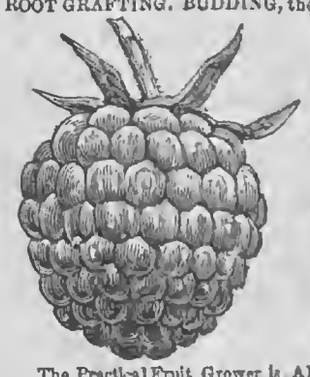
PRICE & KNICKERBOCKER ALBANY, N. Y.

The Practical Fruit Grower!

A NEW BOOK by PROF. S. T. MAYNARD, Professor of Botany and Horticulture at the Massachusetts Agricultural College.

A $2.50 STANDARD WORK FOR 25 CENTS. Most of the books on this subject cost from $1.50 to 2.50, and are of no more real practical value than this one for which the price is only 25 CENTS, POSTPAID. 5 COPIES $1.00. No matter what other work on this subject you have, you will find in this new hints and suggestions that cannot fail to be of great value to every grower. Stamps taken.

The Practical Fruit Grower is a STANDARD WORK by a STANDARD AUTHORITY. All the processes of PROPAGATION, ROOT GRAFTING, BUDDING, the TOOLS EMPLOYED, DIVISIONS OF ROOTS, LAYING, etc., are described and illustrated by 100 engravings made specially for this work. The principal INSECT ENEMIES of the various fruits are ILLUSTRATED, so that the novice can at once recognize them. Their habits of life are fully treated, and simple and inexpensive PRACTICAL REMEDIES are given for their CONTROL AND EXTERMINATION. THIS FEATURE of the "Practical Fruit Grower" WILL SAVE THE COST very many times over in a single season.



IT IS PRACTICAL in the highest degree. Untried theories and uncertain practices are ignored. Only those METHODS ARE GIVEN whose PRACTICAL UTILITY has been proved in SUCCESSFUL EXPERIENCE.

IT TELLS how to get good seed; how to bud, making plain every process by Illustration; how to lay out an orchard; how to set; how to graft; how to mulch; how to make trees bear at an early age; how to change the bearing year; how to pack for shipping and marketing for local markets, distant cities and exporting. Hints on cold storage; how to get the highest prices paid in England for American fruits; how to prevent and get rid of insect pests.

These are only a few of the valuable features of this work. It will prove an INVALUABLE AID TO EVERY ONE interested in fruit culture, any one of the hints and suggestions being worth more than the cost of the whole.

WHAT THE FRUIT-GROWERS SAY: Think it ADMIRABLE, with the very good characteristic of having so large a portion devoted to INSECT ENEMIES NOT SMOTHERED IN DETAIL.—James J. H. Gregory, Marblehead, Mass.

The Practical Fruit Grower is ALL YOU RECOMMEND it to be AND MORE, and no FRUIT-GROWER, however small, CAN AFFORD TO BE WITHOUT the information which it contains. Ideas WERE OBTAINED FROM SINGLE PAGES which are WORTH FIFTY TIMES ITS COST.—S. F. Avery, West Taghkanic, N. Y.

ONE OF THE MOST VALUBLE BOOKS of its size that I have EVER READ on fruit culture. It is so condensed that it gives the WHOLE INFORMATION IN A NUTSHELL.—G. W. Lamb, Stamford, Vt.

COOLEY CREAMERS.

LARGELY IMITATED, BUT NOT EQUALED.
THEY HAVE A PATENTED PROCESS
WHICH NO OTHERS CAN USE.

Are used by more fine butter makers and stock breeders than any other apparatus, because they have proved to make the **largest quantity** and **best quality** of butter with **least labor** and **expense.** They surpass everything in the Cream Gathering System. **Have both Top and Bottom Skimmers.** Cream drawn FIRST or LAST. *No danger or sediment.* Thick walls with dead air space. Used with or without ice.

SIX GOLD Medals and SEVENTEEN SILVER Medals awarded for superiority of process and product. Send for circulars giving facts and references sustaining these claims. DAVIS SWING CHURNS, EUREKA and SKINNER'S BUTTER WORKERS, CARRIERS, PRINTS, and a full line of Creamery supplies.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

TOWER'S FISH BRAND TRADE MARK.

SLICKER The Best Waterproof Coat.

The FISH BRAND SLICKER is warranted waterproof, and will keep you dry in the hardest storm. The new POMMEL SLICKER is a perfect riding coat, and covers the entire saddle. Beware of imitations. None genuine without the "Fish Brand" trade-mark. Illustrated Catalogue free. A. J. Tower, Boston, Mass.

STEEL CLIPPER PLOW

Wood Beam, Light Draft, Light Weight and Strong.

Great care has been used in perfecting a shape that we could guarantee to do good work on hillside or level land, and **ITS SUCCESS IS WONDERFUL.** Being as hard as steel can be tempered, it will **scour in all soils. Steel AUTOMATIC Cutter** and **Foot-Latch.** Operator need not take his hand from the handles to reverse and latch the plow.

Nicely balanced with shifting handles, enabling the operator to walk square behind the plow in the furrow.

PATENT
CORRUGATED
WIRE FABRIC,

Suitable for Fencing in many locations, and for Railings, Window Guards, Tree Guards, and other purposes.

It consists of vertical pickets or bars, made of corrugated galvanized steel rods, oval in section, secured by horizontal cables, each composed of two strands of galvanized steel wire.

As a fence it is cheap, strong, durable, and easily erected; it is as effective as a barbed fence in turning cattle, and there is no risk of injuring either the animal or the fence; it requires no longitudinal rail to support it, as it carries itself from post to post as well as a plain wire or barbed wire fence; it can be seen as plainly as a regular picket fence; it can readily be taken down, rolled up and moved from place to place.

Objections; Polish; Hamburgs; Dorkings; Dominiques, Spanish; Minorcas; Asiatics; Leghorns; French Breeds; Plymouth Rocks.

NATURE universally divides her favors. The truth of this saying is illustrated in our domestic animals: a fast running horse is not a good work horse; cows that produce the most and best beef are not the best for making butter. The same rule holds good with poultry; the best breeds for laying are not the best table fowls, and the best table fowls are not the best layers. Although all our domestic poultry are one species, singular enough, every time selections are made for any peculiar form and color and persevered in till a strain or what is commonly termed a "breed" is made, different characteristics appear, and each of such breeds retains these peculiar characteristics.

So much is said and so often, on the wonderful properties of this breed by one person, and on the perfection of that breed by another, that it is well to take a retrospective glance at the several varieties of poultry, and give a few of their shortcomings (I cannot call them failings) as well as of their merits. In times when fowls receive so much attention, many people are asking, Which is the best breed? Why is not this as good as that? It will therefore be a benefit to many to learn some of the reasons why one breed is likely to give more satisfaction than any other under certain conditions.

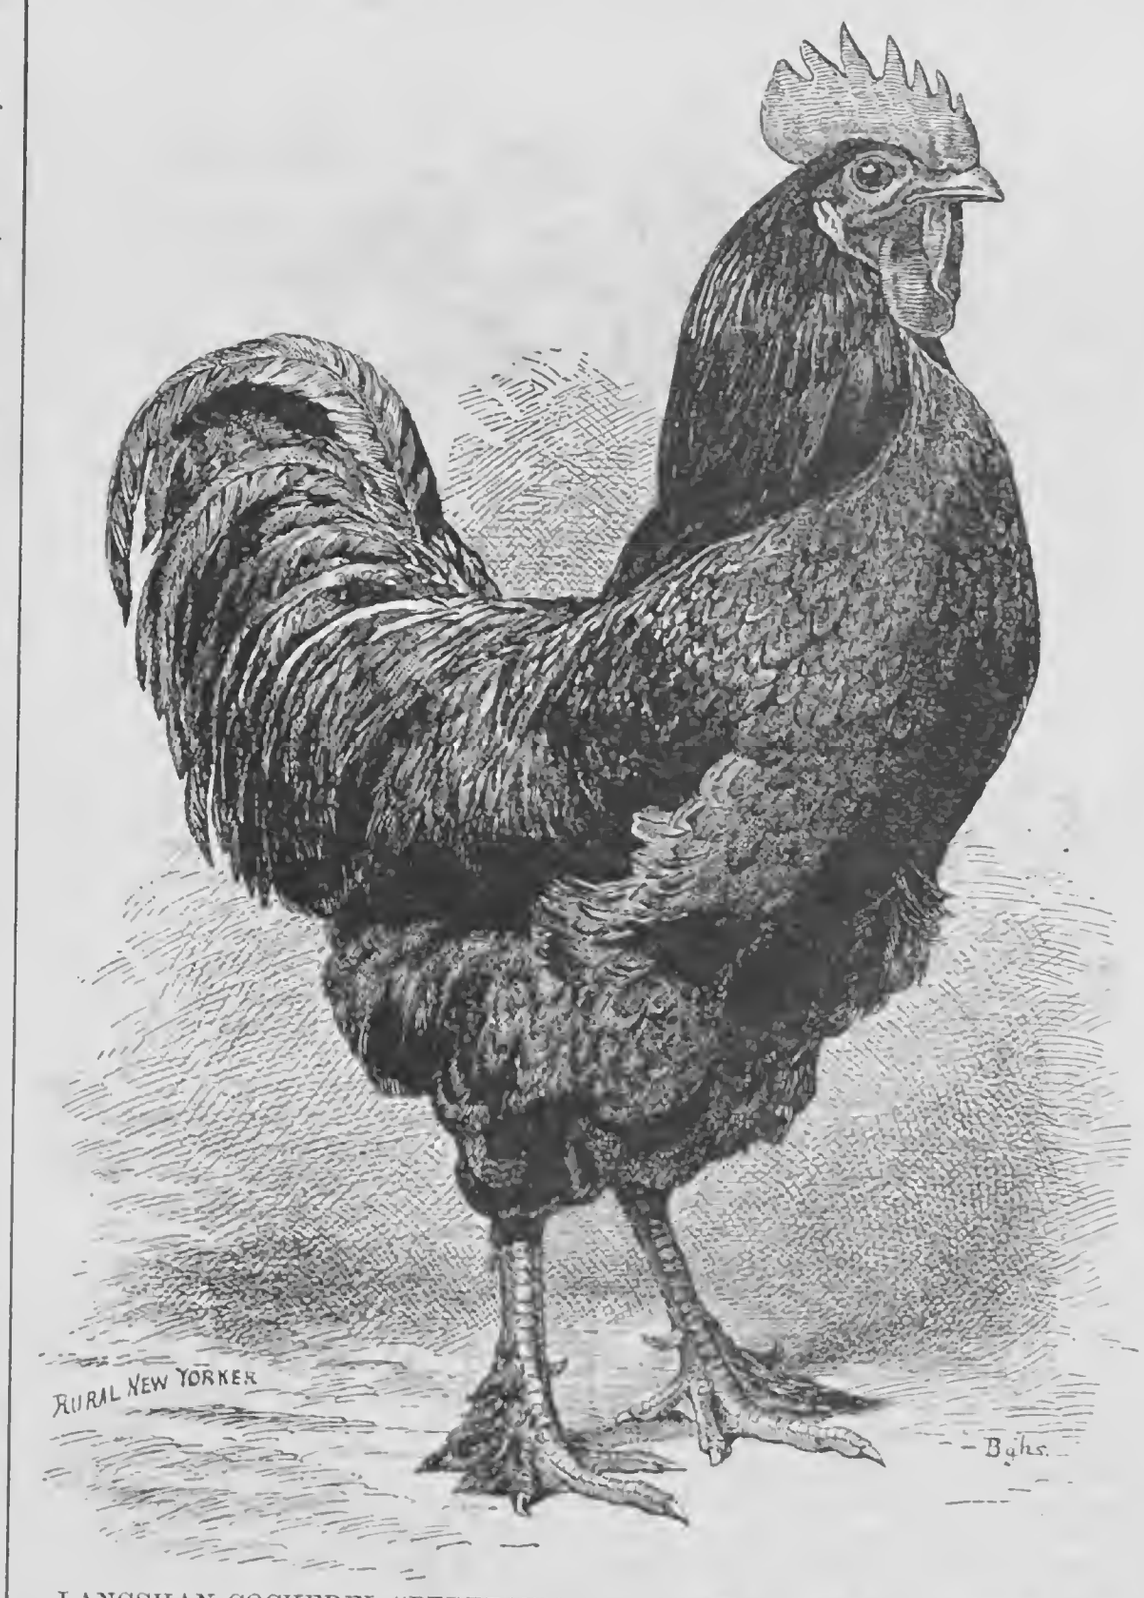
Let us commence with the old Games, as they are the nearest in type to the original progenitors of our domestic poultry. Although fine-flavored for the table, doing their own hatching, excellent mothers, and beautiful in shape and plumage, their eggs are rather small; they themselves are not the best of layers, and are not easy to raise in large flocks for the market. They are valued more for beauty or for their fighting qualities than for the profit to be got from them for eggs or the table. Some of our next earliest known breeds are the Polish, as they appeared centuries ago. Very beautiful indeed! but their top-knots are a decided objection on a farm or wherever else enemies of any kind can reach them, as they cannot see well enough around these tufts to escape like most other fowls, and their flesh is poor. As chicks, too, they are not very easily raised.

The Hamburgs rival any breed for lovely forms, exquisite colors and pencillings. Moreover, they are excellent layers, but like the last, they are non-sitters, the eggs, as well as the birds, are quite small; the flesh of poor quality, and the skins and legs dark. As in the case of the previous breed, there are several varieties of the Dorkings. Although they are large birds and the finest of table fowls, besides being very fair layers, doing their own hatching and being good mothers, they are not very hardy in our cold Winters, and require plenty of room and warm houses. The old Dominiques are also good table fowls, but moderate layers. Next come the Black Spanish and Minorcas, both excellent layers of very large eggs, very good birds for the South; but in our Northern States they are very tender to the Winter's cold. Flesh poor: skin and legs dark.

Asiatics may be divided into two classes—Cochins and Brahmas. Of these the Brahmas are probably the best layers. All of them are slow in growing to maturity, and are great eaters. Although they lay well in Winter, their eggs are rather small in comparison with the food consumed. They are all inveterate sitters and fair table fowls when young. Leghorns are among the most valuable as great layers; but are non-sitters. Rather small in body; flesh only medium. They require plenty of room and high inclosures, as they are great flyers, especially the Brown. The eggs of this breed are smaller than those of the White. The French breeds are scarcely hardy enough for our climate, except the Houdans, and these are not particularly hardy. They are only moderate layers, although fine table fowls. Crevecoeurs and La Flèches, particularly the latter, lay immense eggs; but are entirely too tender for America, at least for the Eastern and Middle States. There are a few more breeds that do not require any particular mention, not being generally known, and their merits and demerits are much the same as those of the allied varieties mentioned.

We come now to the later productions, or recently made breeds. The Plymouth Rocks are a cross between Asiatic and Dominique, receiving the latter's color. As both are sitting varieties, the Rocks are also strong sitters. They are pretty good feeders, but lazy layers, and are inclined to be be egg-eaters. The latest breed, the Wyandottes, are bred between a non-sitting variety, the Hamburg, and the Asiatic. This was expected to be a better laying variety, and so it is; the birds have small, double combs, well adapted to resist frost, lay early, are fairly hardy; but many of the eggs are small, especially the pullets' or first eggs. So, it will be seen all the best points cannot be obtained any better in any one breed of poultry than in any one variety among other kinds of domestic animals. The man who intends to embark in the poultry business, should well consider which varieties are best suited to his circumstances.

Bergen County, N. J.



LANGSHAN COCKEREL "PERFECTION." From Nature. Fig. 190. (See page 303.)

THE SEVERAL BREEDS AND THEIR USES.

P. H. JACOBS.

The largest breeds; Asiatics; American; English; French and Spanish; important characteristics; advantages and objections; the best breeds for the North and Northwest; for the East; for the South.

THE USES OF THE SEVERAL BREEDS.

By strict adherence to a standard of points and careful selection of the best individuals, the breeders have succeeded in classifying fowls into various breeds, each possessing peculiar characteristics, and answering some special purpose for which it was originally intended. As our country is diversified in soil and climate, the introduction of new breeds has been productive of great benefit to the poultry interests, enabling a profit to be made where formerly but little interest was manifested. With the advent of the Shanghai, Chittagong, and Brahma-pootra came a spirit of rivalry in the production of the largest birds, size taking the preference over quality and merit. Scientific breeders, however, made wonderful improvements in the progeny of the original ancestors, and as the thoroughbred cattle, sheep, and swine of today have departed from their ancestral type, so have the domestic birds.

Including all classes of Games, there are several hundred breeds of fowls, but those which are most popular and best known are classed as Asiatic, American, English, French and Spanish. The Asiatics are feathered on the legs; the Americans are clean-legged; the English and French are compact (the favorite breeds possessing five toes), a[illegible] are non-sitters. No pa[illegible] all the desirable qualities [illegible] tion. Though excelling i[illegible] breed many be deficient in others. [illegible] is adapted to certain climates, soils, and [illegible] of management. The best breed de[illegible] upon the purposes for which it is intended, [illegible] distance from market, the quarters, the range [illegible] the fences, and the color of its carcass when dressed.

In an examination of the breeds the Asiatics may be divided into Light Brahmas, Dark Brahmas; Partridge, Buff, White, and Black Cochins, and Langshans. The Light and Dark Brahmas differ in appearance only in plumage, though the Lights have been bred more carefully for utility than the Darks. They have stood the test of several decades, and are as great favorites to-day as at any previous period. The advantages possessed by the Brahmas are pea-combs and short wat-

tles, which fit the heads closely and enable the birds to endure exposure without being subjected to frosted combs and wattles—a great advantage in a cold clime. They are also heavily feathered, being protected with short, fluffy down on every portion of the body, while their powers of digestion enable them to consume large quantities of food, and thereby not only create a sufficiency of animal heat but also to lay during the cold season under disadvantages that would be fatal to some breeds. Hence many persons, while admitting the Brahmas to be excellent layers, do not approve of their capacity for eating a large amount of food, which, however, is really an excellent and necessary qualification instead of being a cause of objection. As they cannot fly, low fences easily confine them, while they also usually lay dark-colored eggs. The Brahmas, however, are heavily feathered on the legs and to the ends of the outer toes, even the middle toe being covered. This is objectionable where the ground is damp and muddy, often causing the feet to become frozen. Some care is also necessary in feeding them, as they readily become fat, after maturity, and then cease to lay. They seldom begin laying before they are eight months old, but if feed judiciously, they lay well at all seasons. As market fowls their yellow legs and skin, as well as their bodies, render them very attractive, and when crossed upon other breeds they always effect an improvement.

The Cochins differ very little from the Brahmas, so far as hardiness and general market purposes are concerned; but they are more compact in body, and have single combs, yellow legs and skin, are feathered probably even more heavily on the shanks and toes than the Brahmas, and can be easily kept in confinement. The different varieties of Cochins are alike in nearly all respects but color, the Partridge being exceedingly beautiful. The Cochins are the best sitters and mothers of all breeds, though their large size is often a disadvantage to them where the eggs used for hatching are thin-shelled.

The Langshan is the latest addition to the Asiatic breeds, and is the only one that has not been changed by the breeders of Europe and America, as it is the same in form and characteristics as when first brought from China. The fowls greatly resemble the Black Cochins, but an observer may notice that the Langshan, though nearly as large as the Cochin, can fly over a high fence, while the Cochin cannot leave the ground. The Langshan has white, *thin* skin, pinkish webs between the toes, legs the color of those of the turkey, long sickle feathers, and it lays when from six to seven months old. It is not an attractive market fowl, its dark legs and white skin being objectionable; nevertheless, it excels as a table fowl, and as layers the Langshans are said to be intermediate between the sitters and the non-sitters.

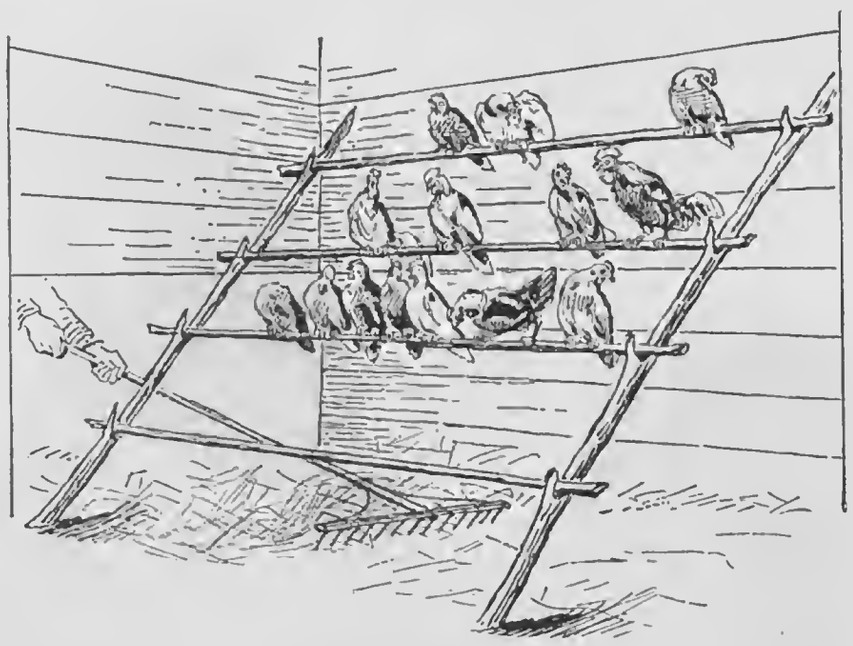
The American breeds are the Plymouth Rocks, Dominiques, Javas and Wyandottes. They are all clean-legged, with yellow shanks and skin. Their popularity is due to their hardiness, medium size, and adaptation to nearly all climates. They combine partially the heavy feathering of the Asiatics, with the long duration of the laying season of the non-sitters. They are not only easily kept in confinement, but also make excellent foragers when running at large. They also lay eggs darker in color than some breeds, which, added to their early maturity, considering their size, is one of their desirable qualifications. The Plymouth Rocks and Wyandottes are struggling in rivalry for popularity; the Dominiques have the objection of small size, while the black or mottled color of the Java is not preferred by many, as they are in other respects very similar to the Plymouth Rocks, some classifying them as Black or Mottled Plymouth Rocks, though they are really distinct.

Of the non-sitters the Houdans (a French breed) are the largest, and they are excellent table fowls; but their dark legs are [illegible]t, while their crests [illegible] roup in damp weather. [illegible]s one of the old-established [illegible] a favorite; but breeding [illegible] a white face has taken away their [illegible]ctness, and injured them in vitality. [illegible] Leghorns are the best layers, and are [illegible]ardy, while the Hamburgs are considered by others as possessing an excellent merit in the rose comb. All the non-sitters lay white legs, and all mature early and are good flyers. Hence, while they are inveterate layers, and will even lay well in Winter if kept warm, they feather quickly when young and are therefore not as easily raised as are the larger breeds. Their heavy combs and wattles are not in their favor in Winter, while they, like all other breeds, cease laying at certain times, both for the purposes of moulting and recuperation.

The only English breed known to me is the Dorking, which is compact in body, possesses five toes, and makes an excellent market fowl in England, but is not a favorite here. The Houdan holds the same position in France that the Dorking does in England. Both are grand table fowls; but, unfortunately, Americans sacrifice all the desirable table qualities for the golden skin and legs, though the best breeds for the table have, like the turkey, white skin and dark legs. It may be also stated that the muscles of the breast are increased by exercise, and it should not surprise those who make a specialty of Brahmas and other large breeds for market to be told that the birds that fly the highest have the most breast meat. The Crevecœur, La Flèche and other French breeds have not proved hardy in this country.

Of the new breeds now being introduced the Minorcas, which are claimed to be the best layers of all, even excelling the Leghorns, may be mentioned as being of the same size as the Black Spanish; but more compact. There are three varieties—Black, White and Red. They have not been tested as yet in this country; but as they are non-sitters and of fair size for that class, and are also considered hardy, they are likely to become favorites. The Games are not considered fully up to the average as layers, but in proportion to weight they possess less offal and more breast meat than any other breed, and stand at the head of the list for the table. Crossed on large Asiatic hens, the Game produces the finest of market poultry, while the largest and choicest capons are the result of a Dorking cock and Asiatic hen.

The breeds best adapted to the Northwest, where the temperature gets below zero, and there remains, are the Brahmas and Cochins, the former being perhaps the better layers and the latter more suitable for hatching young turkeys and ducks; but where there are good markets for the sale of poultry and eggs, the Wyandottes and Plymouth Rocks are excellent if they can have out-door exercise.



CLEANING THE POULTRY HOUSE. Fig. 195. (See page 302.)

The Asiatics, if not fed too heavily, can be kept under shelter with contentment; but other breeds are liable to vices of feather pulling if confined too closely. The Asiatics may be used for crossing upon the common breeds; but the crossings should be continued till the stock is three-fourths Asiatics, and the last cross should be Brahma, in order to secure the small pea-comb as a protection against severe cold.

In the East, or where the Winters are not as severe as in the Northwest, the American or Spanish breeds may be used, while the Asiatics would not be out of place. On wet soils avoid feathered legs, and where there is much rain in Spring, crested breeds often suffer. There are but few breeds that cannot be adapted to the Eastern and Middle States, a warm, dry poultry house compensating for many disadvantages.

The best breeds for the Southern States are the Leghorns for eggs, and the Plymouth Rocks and Wyandottes for market, as the winters are mild, and these breeds, being active, have a longer season for foraging. But, where one is not partial to the keeping of breeds in their purity, many advantages may be secured by crossing, provided pure-bred males only are used for that purpose. It may be safely said that any of the breeds may be kept, in any section of the country, if properly managed, there being greater distinction between those kept under confinement or roaming at large than in climate, though it is best to avoid as many objections in each breed as possible.

SEVERAL POULTRY TOPICS.

I. K. FELCH.

Will hens do as well without males? Eggs will keep longer. Experiment. How many hens to a male for breeding purposes? Will it pay to confine poultry?

I AM of the opinion that hens will lay fully as many eggs if kept to themselves as if they have the company of cocks. This has been an accepted fact ever since I was a boy; but whether founded upon careful experiment I cannot say. Fowls that have had no male escort will be found to show a desire to incubate much oftener when penned with males. This fact may be the source from which has sprung the belief that hens lay more eggs when penned with no male companions.

I certainly should not have penned with surplus stock more than one male to a pen, no matter what number I had, and in producing eggs for the market, if I were keeping hens in flocks of 40 or 50 I should keep no male.

That an egg will keep longer admits of no argument; for an egg not impregnated will come out from under a hen at the end of three weeks' incubation clear; while one that is impregnated, if set on 48 hours and then taken out, will at the end of three weeks surely be of bad odor: while an egg not impregnated may be sat upon 12 days, and then be used for all cooking purposes, and prove as good as the common run of store eggs. The other day I boiled 12 eggs taken out of an incubator, after 12 days' incubation; 10 were clear; two showed the germ to have started, and death at an apparent age of two days. The result was the two impregnated eggs when cut open, had an unpleasant odor, and the white was tarnished, while the yelk had a brassy-white tinge, and the dead germ was not hardened by boiling. Of the other 10 that showed no signs of impregnation, I ate four, and they were to all appearances and to the taste as good as those boiled 12 days old, that had been kept in the pantry. When an egg that has never been in an incubator is broken, the albumen adheres more closely together, and does not run over so large a surface as will that of the eggs which have been subjected to the heat of the incubator for 10 days. This seems to be all the difference. From this fact, is it not safe to say, hens will lay more eggs; wish to sit less frequently, and their eggs will keep much longer, when they are allowed no male escort.

For breeding purposes, how many hens should be associated with a male? If the male is to be penned with the hens, I should say, for Cochins, seven to twelve hens; for Langshans and Brahmas, eight to even fifteen; for Plymouth Rocks, 15; for Wyandottes, 15; for Hamburgs and Leghorns, 20. But care should be taken to put enough so that copulation should result from an invitation from the hen. Such service is four times as effective as in the case of coercion by too vigorous a cock

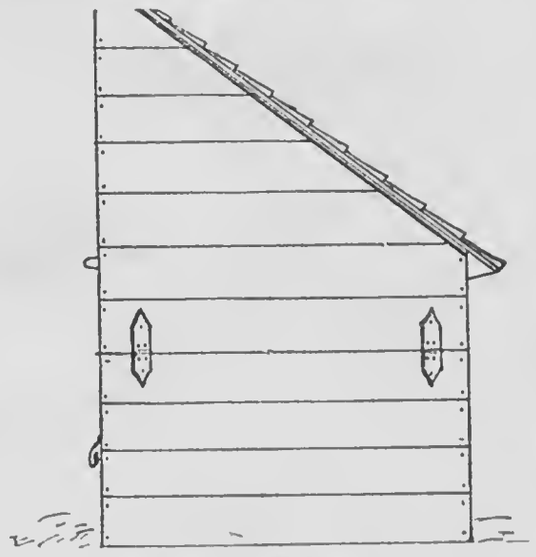


Fig. 194. (See page 302.)

in a pen of a few hens. I have had eggs hatch poorly from a pen of seven females and one male; and the eggs nearly all hatched as soon as the number of hens was increased to 15. There are in all flocks with a single male, more or less hens which will not mate with him, or whose eggs will not hatch. Of late years I have run my pens in this way: I put two males with 25 females, and the eggs hatched well. The hens then selected their own mates, and the results are better.

Will it pay the average farmer to confine his poultry in yards? I say no; but build the poultry houses here and there about the farm, and give perfect liberty to the flock, and in one of these isolated houses pen 25 of the best with two fine males from which to breed the yearly stock, or pen two such lots of birds so as to properly mate the following year. The houses built here and there about the farm for flocks of fifty birds each, with no males, will be a source of income few will concede until they have tried the experiment.

Natick, Mass.

WHY POULTRY KEEPING IS APPARENTLY NOT PROFITABLE.

Profits large in proportion to amount invested; causes of mismanagement; labor well repaid; keeping account; mistakes.

BUT few fail to realize a profit from poultry, though often it is supposed that a loss occurs. In fact, it is almost impossible to incur loss under good management, and it requires but very little management to give a profit. If one should invest $10 in a flock, including food and other expenses, and realize $11, or only $1 more than the outlay, it would give a profit of ten per cent. Yet, but few would be satisfied to expend $10 for food and receive but $11 from the hens, although in some branches of business the proportionate profit from investments is smaller.

Familiar as some are with barn-yard fowls, yet they know nothing of the merits of the different breeds. A "chicken is a chicken," and the very fact that they are of so many colors, shapes and sizes, assists in this delusion. There are at present two classes of poultry raisers, the one giving no care at all, and the other pampering the flocks to an unnatural condition. Mismanagement arises in the one case from not regarding the poultry as being of sufficient importance to receive care, while in the other it is due to overfeeding and deprivation of exercise.

Yet we must include labor as an element in the cost of keeping poultry, and the excess derived over and above the expense is not all really profit; but it is safe to claim that all labor rightly bestowed will be amply repaid if the flock is a large one. Small flocks are proportionately more profitable than large ones, because they utilize much of the waste of the house; but by a correct knowledge of the proper conditions for keeping poultry there is no reason any number should not be kept. Heretofore the drawbacks have been the desire to keep too many together in order to economize room, which entails competition and inequality in allowance of food to each individual. Then there is the failure to supply meat, plenty of water and warm quarters, to say nothing of neglect in cleaning the houses and yards. When the hens are as carefully attended to as the cows and pigs, both as regards regularity of feeding and labor of cleaning the houses, they will give better results.

A large number who do not keep accounts would be surprised at the value of the eggs and carcasses consumed in the family compared with the expense; yet, because a large proportion of food has been purchased, the hens are regarded as unprofitable. A strict account of all receipts and expenses would show a gain of 100 per cent. in many cases. The profit from poultry does not depend upon the gross amount, but upon that produced over and above the outlay, and such profit may be but a small sum, yet be a large percentage on the amount invested. The markets should be watched in order to secure the highest prices, and business methods should prevail.

The reason why poultry keeping is sometimes apparently unprofitable is because the average poultryman is not familiar with the breeds; does not feed a variety, uses no precaution against cats, rats, hawks and other enemies; does not keep the houses and yards clean; does not provide plenty of water; feeds too much concentrated food, and keeps the hens in an unhealthy condition. When these evils are remedied and the poultryman will compare his investments with those of people engaged in other pursuits, the comparison will be in his favor. H.

LANGSHANS.

Equaled only by the Dorking; best food; method of feeding.

WHICH is the best breed of poultry is a hard question to answer to the satisfaction of all. But from my own experience of many years in the breeding of pure-bred poultry, it is my candid opinion that for all purposes the Langshan is the best fowl we have in this country. "Why?" They are large; the pullets mature and lay as early as the Leghorns; they will lay as many eggs in a year as the best laying

strains of Leghorns; they are very hardy, quiet, easily confined, and while not inveterate sitters, they make excellent mothers. As table fowls they are not surpassed by any, and are equaled only by the Dorking. They are bright and active, with small bones, white flesh and thin skin. They are natives of the coldest part of China, and are perfectly hardy even in our coldest climates. I believe pure-bred Langshans have more good and less poor qualities than any other breed.

My experience is that good, sound wheat is the cheapest egg-producing food of all the small grains. In the morning I give a warm feed of scalded oats and corn ground together; at noon, whole wheat, sometimes oats; and at night sifted, cracked corn with, of course, cabbage and other vegetables added two or three times a week.

The feed and care of chicks while growing have much to do with the size and hardiness of the mature fowl. Young chicks should be allowed a free range, with plenty of food of all kinds, and, above all, with plenty of pure, fresh water. The best way to improve farm poultry is to use thoroughbred males and change them every year; use large, vigorous birds and select the best chicks raised each year.

Place the eggs for hatching in a cool, dry place in pans partly filled with oats or bran. Set them the small end down, and do not keep them longer than one week before setting. Although eggs will hatch after having been kept for four weeks, the chicks will never be so strong as those hatched from eggs not so old.

There is no farm stock that will pay as well as thoroughbred poultry or give quicker returns for the money invested.

Windsor Co., Vt. A. A. HALLADAY.

POULTRY CULTURE.

H. A. MANSFIELD.

The best breeds; farmers should keep fairly large breeds; perches; damp houses; kill when about 18 months old; profits.

I THINK the safest rule is not to keep more than 40 or 50 fowls in one house. The yards should be so large that there will always in season be a supply of green grass for them, or they must be let out each day for an hour or two to graze. An orchard with plenty of shade is the very best location. The better the land the better the fowls that are raised on it. Everything in the house must be perfectly dry, with no floor but the bare ground that is dry enough for a dusting bath. Keep the premises clean. Always have clean, pure water before them, and feed so that they are anxious for more, and success is certain.

The kind one keeps is immaterial, there are many good varieties which are profitable if well cared for. I keep Dark Brahmas and find them satisfactory; but Plymouth Rocks, Light Brahmas, or the old American Dominiques are all as good. For farmers it is well to keep a fairly large fowl for two reasons: when killed there is more meat, and all large varieties are better winter layers than the small breeds. I am quite sure more fail on account of over-feeding, and having damp quarters than from all other reasons combined. Many fix the perches too high and make them too small. For the largest fowls it would be as well, or better to have no perches at all; provide leaves, chaff or straw for them to sit on, and they will do quite well. Of course their nests should be movable, so that they can be cleaned and occasionally white-washed. Cheese boxes are as good as anything, where one is not particular to fancy fixtures. For farmers, the best way is to kill everything when about 18 months old, supplying their places with chickens hatched the last of the preceding Spring. The man who cannot make, on an average, a net profit of $2 per hen from his flock, must manage very poorly. I have made $3 per hen a year clear on a flock, estimating everything at ordinary market prices of eggs for table use; to say nothing of the value of the fowls for the block. I recently killed a year-old cockerel that dressed 8¾ pounds, and would be worth $1.75 if I had bought him at the market. The same bird weighed as much last November, and would have sold then for over $2, so that if then sold, his winter feed would have been saved. If a man raises 200 chickens, and half are cockerels, he can kill and sell these, when six or seven months old, for enough to leave him the pullets for nothing just when commencing to lay, and this they will continue to do all Winter if hatched in April.

The best fowls for farmers are undoubtedly Light or Dark Brahmas and Plymouth Rocks, all being large, hardy and good winter layers. Of all things, keep the fowls where they cannot eat filth. Hens that run in a hog pen lay eggs that no one can enjoy. Let any doubter boil one, break it and see how it smells. Fried, the odor is not so noticeable. Farmers should get a few good fowls that they like; take good care of them, and increase the number after the owners see that they are the best paying stock on the farm. They will eat the small potatoes boiled, mashed with wheat bran; drink the skim-milk, and return more for them than pigs twice over.

NEST BOX. Fig. 191. (See page 303.)

FEED FOR SPRING, SUMMER, AUTUMN AND WINTER.

The laying hen not a market fowl; corn is an expensive food for laying hens; variety; do not feed corn in Summer; food for moulting hens; fowls for market.

FEEDING in Spring is to make allowance for change in temperature, and as the fowls will require less food for the creation of bodily heat, and a large proportion of that which is essential to egg production, the poultryman must arrange his methods of feeding accordingly. It may be stated, however, that any mode of feeding that keeps the fowls in health will answer for all the seasons, and the great obstacle most frequently met with is overfeeding. With the advent of poultry literature came an improvement in the management of poultry, but in a majority of cases the neglect and ill treatment of former years have been supplanted by an extreme in the other direction.

The first lesson for the beginner to learn is that the laying hen is not a market fowl; that is, she should be fed differently from one that is intended for sale. Poultry for market should be fat, and as heavy as possible. The laying hen is by no means at her best when very fat, and often cannot lay, while soft-shelled eggs, weak legs, infertile eggs, and liability to bowel diseases are also to be contended against when she is in that condition.

There is no grain as cheap as corn; but it is very expensive feed for laying hens when fed almost to the exclusion of other grains. The hen in her natural condition is compelled to work. She not only travels over a large space in search of food; but scratches industriously for it, and as she feeds on both animal and vegetable substances her range for procuring food is very wide, and she requires a variety. She performs more work as a producer than any class of animals, for while the cow requires months for the development of its young within the body, the hen stores up the necessary material for the development of the young chick in a few hours. Hence she requires not only a large amount of food, but that which consists of all the elements essential for the purposes to be achieved; and, it may be added, above all substances, she requires plenty of drinking water, as an egg is 95 per cent. water.

The same mistake is made in feeding hens that is made in feeding swine. Too much concentrated food is given, and not enough of that which is bulky. Grass, vegetables (either raw or cooked), and insects (or meat) are the best for laying hens, with a grain ration, once

(Continued from page 299.)

a day, as an accompaniment. Corn may be fed in Winter to laying hens (if the weather is very cold); but it should be discarded in Spring and Summer. In the Fall hens usually begin to moult, which compels them to have food of the richest quality, as the shedding and renewing of the feathers is very weakening. A proportion of corn may, therefore, be their feed in order to protect their naked bodies as the season becomes cooler.

In the morning, early, the hens may be given soft food. An excellent mess, and one that is very nourishing, is to cook a piece of rough beef, or the lights and livers of steers or sheep, until quite done, and if finely chopped so much the better. One part bran, one of middlings, and one of ground oats may be added, with potatoes, until the mess is thickened. It should be so fed that the hens will be rather hungry than full, or they will not take exercise. No other food should be given during the day except chopped cabbage or onions in Winter, or grass in Summer. At night give plenty of wheat. Cheap messes may be made by cooking potatoes or turnips for them. If the fowls have plenty of range, a warm mess of cooked meat and potatoes will answer for them in the morning; but they should have all the wheat they can eat at night. Ground bone, lime in any form, and plenty of gravel should be provided, and all the soft food should be salted to taste. The art in feeding is to give the hens a variety at all times, but not to allow them to become fat. They must be made to scratch in something for the whole grains. Such active birds as the Leghorns seldom become too fat, which partly explains why they lay so well; but all the large breeds will fatten readily after reaching maturity. Winter feeding demands some corn; Spring and Summer a large proportion of bulky food; while Autumn calls for food rich in growing material, as there is then a preponderance of young stock and moulting hens. Fowls intended for market should be kept separate from others, and be allowed all the corn they will eat.

GENERAL-PURPOSE FOWL.

Roomy yards; care of eggs to be set; number of cocks; green food.

For a general-purpose fowl I would select the Light Brahma for crossing on the common stock, because the offspring is a large, well-developed, handsome fowl, very hardy and free from disease. Moreover, it fattens readily and always brings the highest price in the market. Such birds are very docile, and the hens are good layers of large eggs.

Fence poultry in rather than let them spoil the garden; but don't confine them in small pens. Make roomy yards for them and they will do better than when allowed to roam about at will, always seeking an opportunity to do mischief. I have never noted any difference between the eggs from birds on high and dry land, and those from others or the same on low and damp ground; but I would not advise any one to buy fowls and transfer them from very dry to very low land. Place the eggs under a careful hen as soon as convenient after they have been received from the dealer. If you cannot set them immediately, unpack them carefully and place them in a broad vessel, only one layer in depth, and keep them in a cool (not cold) room. Turn them every day, so that the yelk may not settle to one side. In this way they may be kept good for several days.

I do not find any difference in the shape, size, quality or number of eggs, whether cocks are kept with the flock or not; but if I were keeping hens for the production of eggs only, I would not keep many (if any) cocks, as they would consume considerable food and give no return whatever for it.

In Summer nothing equals grass as a green food, either for poultry or for anything else. In Winter anything that comes the nearest to grass would undoubtedly be the best. For the [who] keeps only a moderate-sized flock, [cab]bage, potatoes, etc., from the [table] and fed to the fowls is, in [the] most *economical* and the best [food].

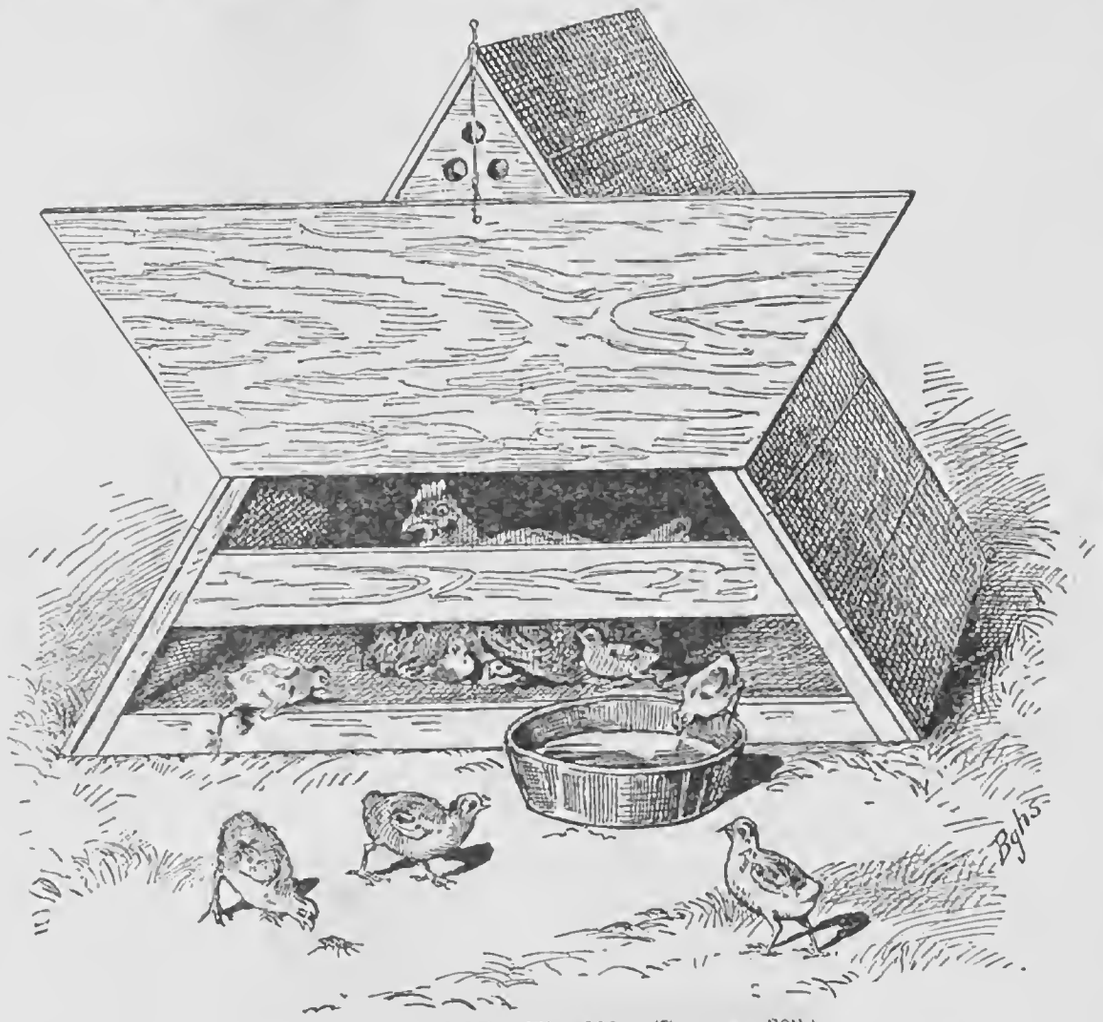
[Whe]re the hens of the desire to sit, shut [them] up in a small coop, giving plenty of [wa]ter and feeding sparingly, though by no means starving them. E. H. UPSON.

Noble Co., Indiana.

THE POULTRY FANCIER'S MEDICINE CHEST.

DR. HENRY STEWART.

As a rule, I believe in Mr. Macbeth's idea: "Throw physic to the dogs—I'll none of it," and prefer prevention to the best cure. But then, I also believe that the most important office of "physic," or medicine, is to prevent diseases, and to know how to do this is the great skill and art of the physician. When a young man and a student, I became acquainted with a most wise and effective system in vogue among French physicians, which I mention here incidentally, because it might be introduced among us with very great advantage; this is, to contract with the family physician to pay him for preserving the family in health for a regular stipulated monthly fee, the payment being suspended whenever any of the family is sick, and as long as the sickness continues. The advantage is obvious. This would be an excellent thing for all owners of live stock to do, to engage veterinary surgeons to regularly visit their stables and keep the animals in health and restore them when sick as quickly as possible. And this system should be practiced in the poultry yard.



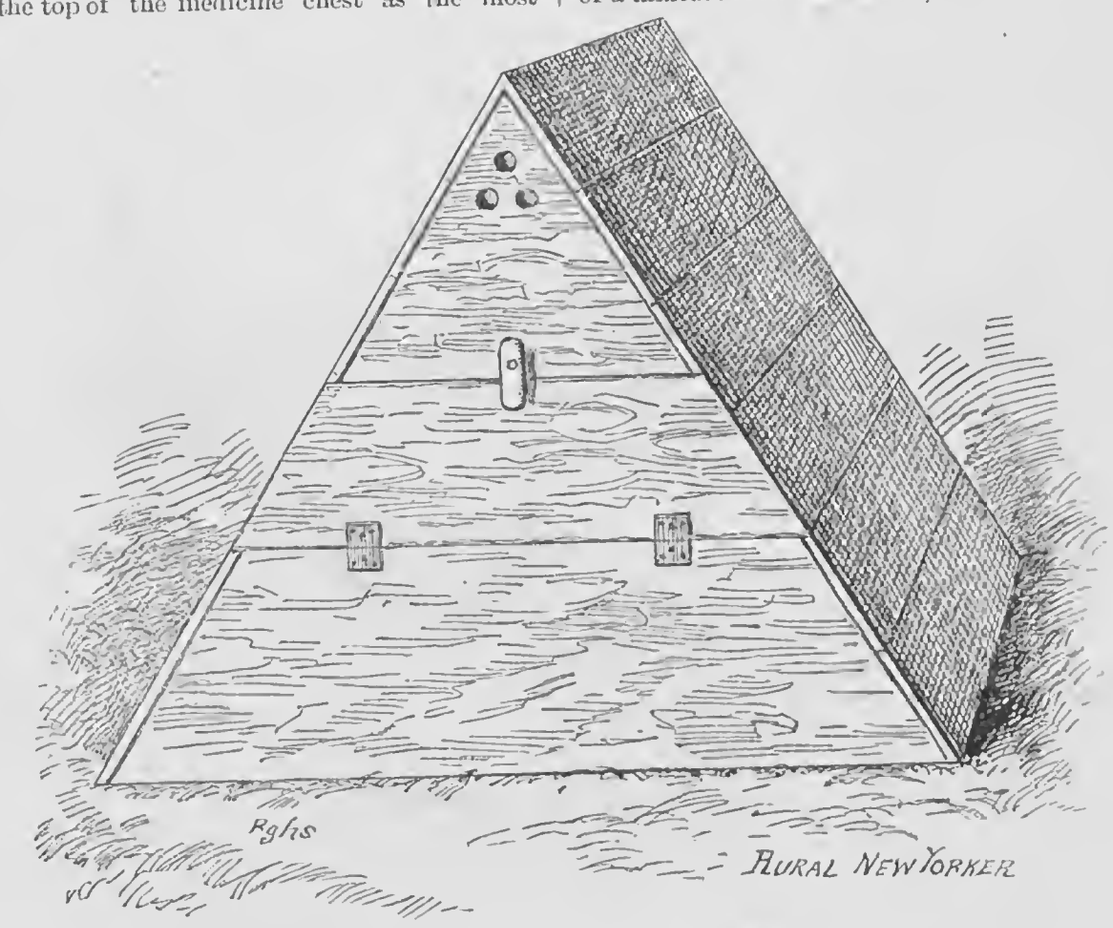
A HANDY COOP. Fig. 200. (See page 303.)

The greatest cause of sickness and death among poultry is overfeeding. The common practice is to give the fowls all they will eat, as if fowls were wiser than hogs and knew when they had enough. Fowls and hogs, and even cows and horses, when they can get at a meal bin, never know how to stop until they are gorged full to the top of the throat, and then trouble begins. First, there is indigestion, then fever, then cholera or fever and gangrene of the intestines, or inflammation of the mucous membrane, which is catarrh or roup; or anthrax, which is black comb, and other fatal disorganizations of the muscular tissues and the liver. In these cases medicine is of little avail, and the only remedy is a sharp little ax, which might justly be fitted in the top of the medicine chest as the most effective remedy for most of the diseases of poultry.

The next great fault is the want of perfect cleanliness, which includes pure water, pure air, a clean floor, a clean run for the chicks, the utter absence of vermin, and a wholesome variety of food. No medicine whatever can cure the evil results of this want, except the ax aforesaid, and the deep burial of the virulent contagion produced by this second grand mistake. During the last three years I have not had one sick fowl, nor have I lost one chick which has been safely hatched, and this comfortable result has been due to the exercise of these precautions and the costly experience of previous losses which I could have avoided had I learned how. But it takes years and years to learn how to do this, and in the mean time some help can be gained through simple medicines.

The second article of special need for the medicine chest is a barrel of lime kept in an open, dry shed where it will become air-slaked into a fine, dry, pungent powder. This is to be liberally dusted over the floor, the perches, the nests, and the walls of the house two or three times a week after it has been cleaned thoroughly of all the droppings; and just at sun-down when the fowls are about to go to roost. The fine dust is breathed and makes the fowls sneeze and wheeze, and clears out their throats and nostrils, destroys gape worms, and cures any possible irritation of the nasal and bronchial membranes. I consider this "a great popular remedy" worth a million boxes of roup pills, catarrh and cholera specifics, "eggine," egg powders, and all the other quack nostrums offered for 50 cents a pound, and very much cheaper. It also keeps the scab mite, which produces the unsightly scaly leg, at a distance, and chokes off lice, fleas and red mites.

Something, however, may usefully be kept in readiness for accidents, and I find a bottle of a mixture of raw linseed oil, with one-fourth part of kerosene oil and a fortieth part of creosote, is handy as a complete remedy for scaly leg; and also for all the small vermin, when it is liberally applied to the perches, especially in every crevice where they may hide. A solution of one ounce of chlorate of potash in a pint of water, applied with a clean feather or one of the little squirt fillers used for stylographic pens, to the nostrils and throat, a little also being sent down the throat to the stomach, is a sure cure for croup, diphtheria, sore throat, pip or scaly tongue, a sore purulent discharge from the eyes. I have cured every case of cholera, or the green and yellow discharges, which happened for two or three years before I learned how to prevent them, with one teaspoonful of a solution of one ounce of hyposulphite of soda in a pint of water, and this is the last item of my list of medicines for poultry.



A HANDY COOP. Fig. 201. (See page 303.)

As a warning against spending money uselessly, I might refer to the various preparations and mixtures sold as poultry powders and egg-producing food. One of the most highly recommended of these was once analyzed and found to consist of wholly useless and very cheap materials, with a little Cayenne pepper to give it flavor. All these are useless and I believe do harm, and just as the quack medicines for infants and older people are to be avoided, these should be, with the costly crushed shells which are at the best indigestible and which are not nearly so good as fresh bones broken up with a hammer on a block in the yard, and which furnish all the lime required, in a digestible form.

NOTES ON THE COMMON DISEASES OF POULTRY.

F. L. KILBORNE, B. V. S.

FOWL OR CHICKEN CHOLERA.

The most important disease, causing the greatest loss of animals, is *fowl cholera*. This is a highly contagious, bacterian disease, very fatal to all fowls and birds, and due to the presence in the system of a living microscopic organism or bacillus. The disease cannot be produced, as is very commonly supposed and so stated by some writers, by filth, want of care, or any other unhealthy condition, except this germ of the disease is present. Then it is that the above unhealthy conditions greatly favor its spreading and increase its mortality. The germs are generally taken in with the food or drinking water, and then find their way to all parts of the system, while the disease is readily spread by contact with diseased animals or any of their products.

The symptoms, like those of most other diseases of poultry, are not altogether satisfactory. There is usually dullness, ruffled feathers, drooping of head and wings, unsteady gait, a greenish-yellow diarrhœa, sometimes frothy, and later frequently bloody. The comb and wattles become very dark-colored or black. The fowls seek the sunshine or crowd listlessly together to keep warm. With a clinical thermometer an elevation of two or four degrees in temperature (108°—110° F.) is usually found. Any or nearly all of the above symptoms are absent in some cases. But whenever the fowls are dying rapidly without apparent cause and fowl cholera is in the neighhood, it may be suspected, and precautions be taken accordingly.

Treatment is rarely desirable on account of the very contagious nature of the disease, although a considerable number may recover, especially after the disease has prevailed for some time.

Its "stamping out" and prevention are very simple and comparatively easy if thorough measures are at once adopted and carried out. First kill or isolate all diseased fowls, and burn or bury very deeply—at least three feet—all dead animals and their products. Then thoroughly disinfect the whole interior of the hen house and the runs by washing or freely sprinkling with a solution of sulphuric acid—acid one pint, water eight gallons. Where the fowls are allowed to run at large, it will be necessary to confine them to smaller quarters, so that the whole may be disinfected. Watch the healthy flock carefully, and remove any showing symptoms of disease. Use the disinfectant generally three or four times a week and daily on the droppings as long as cases of the disease continue to occur. A few drops of the acid in the drinking water will also act as a preventive. Where the fowls were running at large when the outbreak occurred, it will be safest to keep them confined for three or four months after the disease has all disappeared, so that the germs that may be lying hidden about the place will have time to die out. Fowl cholera, like most other contagious diseases, will die out of itself when there are no suitable animals for it to prey upon.

GAPES.

Another contagious affection of fowls is known as gapes, or as it is sometimes called "pips." It is a disease especially of young birds with which it is very fatal, and is due to the presence in the trachea—windpipe—and bronchi, of the Syngamus trachealis, a small red worm, three to five-eighths of an inch in length and apparently forked near one end. The old birds frequently harbor the worms, but with them they rarely prove fatal. The symptoms are very characteristic. The young bird will occasionally open wide its mouth and gape or gasp for breath. Breathing gradually becomes more difficult, the animals

gape more frequently and finally droop and die.

Various methods of treatment are in vogue, all of which are more or less successful, but none entirely so. Turpentine or strong camphor placed upon the outside of the throat, to be inhaled, is relied upon by many, and is very successful. A few drops of either may also be placed in the food. Another method is to place the chicks in a covered box, in the bottom of which is a layer of air-slaked quick-lime. The box is shaken to "raise a dust," which the chicks are forced to inhale for one or two minutes—not longer. Either method should be repeated on any of the birds showing the first indication of gaping. The worms may be partially or entirely removed with a small twisted loop of horse hair or with a hen's feather stripped of its plumes except near the tip. The mouth being well opened by an assistant, the loop or feather is to be carefully introduced into the opening seen in the middle of the back part of the tongue, and pushed gently down the windpipe to its lower end, a distance of two or three inches; then twist it around several times as it is gradually withdrawn. If successful, one or more of the red worms will be removed. The operation may be repeated two or three times, and again at intervals whenever necessary. The chicks must be handled very carefully or the treatment will be worse than the disease. If the loop or feather is dipped in camphor, turpentine, salt or tobacco solution the worms not removed may be killed and later coughed up by the chicks. [Turpentine has succeeded with us.—EDS.]

To prevent the spread of the disease, burn all of the worms found and also the dead animals, or at least their respiratory orgaus. Move the young birds to new quarters and saturate the ground of the old quarters with a strong solution of salt, coal oil, kerosene or turpentine. In generally infected localities it may be necessary to keep the young fowls indoors or on a concrete floor or platform outside. This is an effectual preventive on the worst infected places, if care is taken that no infected food or water is supplied. Pure rain or spring water should be used, otherwise the water should be boiled. Small, infected yards may be made safe by soaking the ground with one of the above solutions.

ROUP OR CROUP.

The usual causes of roup are cold, dampness, wet, and exposure. Although apparently contagious, the outbreak and spreading of the disease are probably due primarily to the surroundings instead of being transmitted from fowl to fowl as in the cholera.

The symptoms are, loss of appetite, dullness, ruffled feathers; the breathing becomes rapid accompanied by a wheezing or crowing sound. There is a discharge from the nose and mouth, at first thin and later thick and fetid. The head and eyes frequently become swollen. Yellowish-white fibers and raw sores appear upon the tongue or in the mouth and throat. The nostrils are frequently swollen shut so that the animal is obliged to breathe through the mouth. Red swellings and false membranes also frequently appear on the face, about the eyes and on the combs and wattles. Diarrhœa usually sets in later.

In the treatment of this disease a change of food is usually desirable. Feed green or cooked food—vegetables and puddings of rice, oat or corn meal. The false membranes may be removed with the forceps and the swellings and raw sores bathed with a solution of nitrate of silver—15 to 20 grains in a wine glass of water. Dissolve a dram of chlorate of potash in each pint of the drinking water. If the head is much swollen, bathing two or three times daily with water acidulated with vinegar or boracic acid will afford relief. If there is diarrhœa give a grain of sulphate of copper, a teaspoonful of quinia wine or brandy twice or three times daily. A little Cayenne pepper may be advantageously mixed with the food. Provide the sick fowls with a comfortable, dry, warm, sunny place.

LOUSINESS.

Lousiness is very largely due to want of care, and filthy surroundings. In order to keep clear of the lice, the hennery and yards should be freely white-washed at least once in three or four months. At all seasons of the year, but especially in Winter, the fowls should have free access to a large, shallow bin or box in a light, dry place, preferably where it will be in the sunshine, in which should be three to six inches of a mixture of dry road-dust and wood ashes or air-slaked lime. Whenever it becomes damp it should be replaced, but this will rarely be necessary if placed a few inches above the ground and the hennery is covered with a tight roof. Further treatment should rarely be necessary; but in extreme cases the fowls may be sprinkled with wood-ashes, snuff, flowers of sulphur, or Persian insect powder, or rubbed with sulphur ointment—flowers of sulphur one part, lard or oil four parts—or whale oil. Water saturated with coal oil or kerosene is also an effective wash for lice on any of the domestic animals. For very young fowls, any pure oil or lard to which may be added a little sulphur, may be applied on any warm day. Sitting hens should always be examined and treated when necessary a few days before hatching. The nests should be sprinkled with ashes, sulphur, fine tobacco or snuff.

LEG WEAKNESS: LOSS OF FEATHERS.

Both conditions are not uncommon and are due to want of proper care, insufficient, inferior food, unhealthy surroundings and old age, or more rarely to too high feeding in close quarters. Being due almost or entirely to faults in management, the proper course of treatment suggests itself. Correct the faulty conditions, and thus remove the cause. Feed the animals moderately good, wholesome food, with an occasional change. See that they have light, dry, airy quarters, such as you would provide for the horses or cattle. Usually no medicinal treatment is needed.

DIARRHŒA AND COSTIVENESS

are symptoms of disease rather than diseases of themselves. They also frequently occur from improper diet, cold, wet, or otherwise unhealthy conditions. Their treatment for the most part consists in seeking for and removing the causes. In most cases this is all that will be necessary. In severe cases of diarrhœa, wet the food with lime water, and give a teaspoonful of quinia wine or brandy in the morning to each fowl until relieved. If this does not succeed, take one dram each of prepared chalk and powdered rhubarb, and one-fourth dram Cayenne pepper; mix with the food for twelve or fifteen fowls. It must be remembered the fæces of fowls are normally very moist, and that it takes but a very slight change to cause apparently a severe diarrhœa. A looseness for a few days in a fowl otherwise healthy, does not call for medicinal treatment. It is only where it is very fluid and continues for some time that such interference is demanded except in particular diseases, and even then it is best to check the diarrhœa gradually by improved diet and care when possible. Costiveness may be treated by mixing with the food a little castor or linseed oil, and feeding green food or vegetables.

ANTHRAX, BIRD-POX, TUBERCULOSIS.

Are all contagious diseases due to specific disease germs. Fortunately they are not common in this country, although occasional outbreaks occur. Treatment is never desirable. The diseased animals should be destroyed and the disease "stamped out" by thorough disinfection.

INJURIES.

Fowls frequently sustain severe injuries, but their wounds heal very readily and rapidly with simple treatment if the animal can be kept quiet in a comfortable place.

In general, with proper management, except where contagious diseases are introduced among the fowls of the farm, little or no medicinal treatment should be required. What then constitutes proper management? In the first place we may mention cleanliness. Wherever you find cleanliness you will usually find care. Filth is an indication of the want of care, and always breeds disease. By "clean" we not only mean free from dirt in the ordinary sense, but also free from foul odors; in other words, wholesome. This condition is easiest secured about the hennery and yards by the free use of the white-wash. Next, the fowls should have warm, light, dry, airy houses, preferably with a southern exposure. Too many farmers appear to think that any place from a close, damp, foul cellar to a 4x6 hennery, so-called, or the shade trees about the buildings, is quite good enough for the poultry. In fact, they seem to think the poultry not worth their attention. Certainly in too many cases they receive none.

The feed should be wholesome, regular, and frequently varied to give the best results. The drinking water should be pure and fresh daily.

When any disease appears among the poultry it should receive prompt attention. Unfortunately the symptoms of diseases in poultry are so general and nearly alike in many cases that it requires considerable experience to readily distinguish the particular disease at the outset. But it is always safe to immediately remove any sick animals from the flock and confine and watch them closely. When several animals die in succession, something is wrong and the farmer should carefully look after the feed and management.

If properly managed and cared for, the poultry of the farm will bring better returns for the capital and labor invested than any of the other farm stock.

Stock and Poultry.

NEW POULTRY BOOK!

16 YEARS' EXPERIENCE **In Artificial Poultry-Raising.** This book will be found **worth many times its cost** to every one who keeps a flock of hens. Old poultry raisers pronounce it the **most remarkable contribution to poultry literature** ever issued. The author, Mr. James Rankin, is undoubtedly the best **practical authority** on the subject. For the **past 30 years** he has been engaged in **growing thousands of chicks and ducks** yearly. In this book he gives his **actual experience**, but advises nothing but **sound theory, confirmed by actual experiment.**

A FEW OF ITS VALUABLE FEATURES: *Early* **Experience With Incubators. The Location, Management and care of Incubators.** How to distinguish between fertile and infertile eggs, with **illustrations never before made** showing the **development of the chicks** and the **appearance of the egg** at different states of development. The chapters on these subjects are **each worth the cost** of the whole. **How to Make and Use Brooders is Fully Treated.**

DISEASES OF POULTRY. Particular attention is given to **describing these diseases,** so that the novice can **prevent them.**

RAISING EARLY DUCKS FOR MARKET is a chapter that will excite **intense interest.** This **exceedingly profitable** branch of Poultry raising is but **little known.** The **ducks are easier to raise than chicks,** not one per cent of fertile eggs failing to hatch, and the ducklings being very hardy. The cost of raising is only **26 cents per head,** leaving **a net profit of 75 cts. to $1.75 PROFIT OF $1 APIECE** and **tells how he does it. How** to **make an Incubator** for $25 apiece. Mr. Rankin makes an average and brooders for $6 that will do the work of 300 machines is told for the first time by the man who has done it successfully for several years. **All fully Illustrated.**

WHAT THE POULTRY MEN SAY. It is the **most useful** of any work I have ever seen on the poultry business.—Geo. S. Hosie, Franklin, Mass.

It is the **best thing out** and if its suggestions are faithfully and practically carried out, will **not fail to insure success.**—D. J. Rathburn, Rockville, Ct.

It is the **most practical common sense** Poultry Book I have ever seen and should be in the hands of every poultry man or farmers whether they intend to use an incubator or not. The chapter on Testing the Eggs and Development of the chicks are **worth many times the cost** of the book.—F. A. Hunaford, Chicopee, Mass.

Price Postpaid, Only 25 Cents. Postage Stamps Taken. 5 Copies $1.

Mention this Paper. **THE PHELPS PUBLISHING CO., Publishers, Springfield, Mass.**

BLYTHECOTE FARM POULTRY YARDS.

INTELLIGENT BREEDING PAYS! BLYTHECOTE STRAIN OF WYANDOTTES.

Annual improvement sought by careful matings selected from the best. One setting of choice Eggs will produce more first-class birds than ten settings from inferior stock. A limited number for sale from the above yards this season. Price, $3 per Setting of 13; Two Settings, $5; Five Settings, $10.

WIGMORE'S PATENT

FARMERS' CAPONIZING SET.

Enabling every Farmer and Poulterer to do his own caponizing. A fowl improves by this operation, as follows: It grows rapidly and again as large, the meat becomes finer and free from strong taste, and costs no more to feed, and 50 to 100 per cent more is made on caponized fowl. No farmer who raises chickens can afford to be without my set. A set of the above, with full instructions, in a flue case, sent to any address by mail, on receipt of price; **$3.00.**

Wm. H. Wigmore,

1075O. EIGHTH STREET, PHILADELPHIA, PA.

(*Continued from page* 301.)

POULTRY ON THE FARM.

FARMERS should purchase fowls rather than eggs. Let every farmer who wishes to improve the quality of his poultry visit the nearest Plymouth Rock or Wyandotte breeder (I prefer the Rocks by all odds to the 'Dottes), and then select one, two or three cockerels, as his needs may require. One vigorous, hardy cockerel, not cock, is sufficient for 20 females, when allowed full liberty, which most farmers' fowls have. Let him take them home and at once make mince-meat of his old stock of males, or, better still, let him kill the old males before purchasing his fresh stock.

Such birds can always be bought for about $2.50 each. The second season purchase one or two more cockerels and kill off all the old stock of hens. In-and-in breeding, when kept track of, is of advantage. The great trouble with most farmers when they inbreed is that all the earliest, most vigorous and finest specimens are killed for the market, while the farmer from year to year reserves for his breeding stock of another season the scrub and stunted August and September-hatched chicks that the itinerant butcher won't buy at any price. Every man who ever made a success of breeding fancy poultry has practiced and does practice in-and-in breeding to a greater or less extent: but all who are successful keep track of their lines of blood.

Some farmers will say, "We have no time for such nonsense." All right; but let each keep some little idea in his head as to how his male birds are bred, and that will be enough to answer the purpose. The best specimens, however, should be kept for home use, and the poorer sent to market. The breeder of Plymouth Rocks must have his eight-months pullets average 6½ pounds and his cockerels eight pounds. What farmer's flock, to your knowledge, will average the same weight at the same age?

I do not believe that a rolling or a level country will in any way influence the general development of poultry. But high, well-drained land is always preferable to a low, swampy situation. I would advise farmers to purchase from breeders whose yards are located on a well-drained soil, with a tendency to gravel—such birds having been free from dampness and moisture all their lives, will be free from roupy affections. But I do not believe that poultry are improved in flavor of flesh or in general table properties as are sheep and cattle by being in a flat or hilly country. Given a good, clean, clear gravel soil, thoroughly drained and free from fogs and atmospheric dampness, poultry will do as well on a plain but ten feet above tide-water as upon a tableland 1,000 feet above. In sending away eggs, I prefer baskets for small orders, boxes for large. My method for both styles of packing is to place a layer, about two inches deep, of finely-cut hay or straw (as a sort of cushion) in the bottom of the package; then three or four thicknesses of newspaper; then a layer of bran; then a layer of eggs stood on their small ends in the bran; another layer of bran carefully pressed all about the eggs. (In cold weather each egg should be wrapped in a separate piece of paper and the basket should always be lined with paper to keep out the cold. This is not absolutely necessary.) Then I put on three or four more sheets of newspaper to prevent the eggs in the upper layer from working down to the lower through the bran; then a layer of bran, eggs on the small ends again, etc., finish-

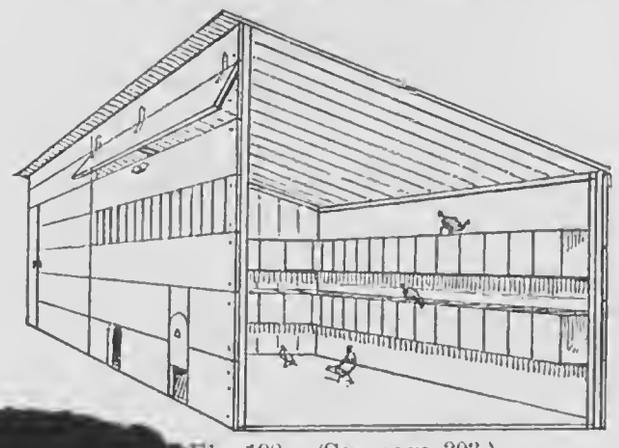

Fig. 198. (See page 303.)

with a cushion of cut hay. The always be screwed on to the boxes. round, hard-shelled eggs, of medium ld be selected. Long, narrow, very or very small eggs had better be eaten. gs should not be kept over ten days before etting, and never be set after 15 days.

Queens Co., L. I. P. H. SCUDDER.

HEREDITARY TRAITS IN POULTRY.

THE question is often asked, "Have the environment and habits of parents any effect upon the offspring?" As a matter of course, this question carries with it the presumption that only such characteristics as the offspring has at its birth are meant, and not the habits which it acquires from its parents during infancy.

This is not merely a topic for idle discussion, but it has an important and practical bearing. If it be true that natural characteristics are transmitted from parents to offspring, we cannot examine too carefully into the pedigree of the animals we purchase or raise for breeding. For example, if this be true, the foal of a mare living in a hilly section, would have those muscles required for ascending and descending hills more fully developed than one whose parents lived in a level country, and would consequently be more valuable to a dweller in such a country. Or a calf whose parents were rustlers, compelled to seek their own living on the plains or along the hedges, would be better for a dweller on a poor farm than the dainty offspring of a St. Lambert.

With poultry this subject is of equal, if not greater importance than with other animals. If eggs from hens accustomed to a warm climate do not produce as hardy chicks as eggs from hens accustomed to the cold and storms of the North, it is important that farmers and fanciers should know it. Birds whose parents have never seen mankind with a gun or other weapon, have no more fear of him than of any other large animal; while our local birds, although they never saw a man or the effects of a gun, will not permit us to come within even shooting distance. This must be either a hereditary trait or communicated from parent to offspring. The former is the more probable. Last Spring I purchased a setting of Wyandotte eggs, set them under an ordinary hen, and in due time they were hatched and followed their step-mother in a very natural way. At the same time I set a number of ordinary hens on their own eggs, which also hatched in due season. I soon noticed that the Wyandotte would not associate with the ordinary chickens, and as soon as their foster-mother left them, they went off by themselves to roost. It was really comical to see them avoid their plebian cousins; they would walk away in the most approved aristocratic fashion when the commonplace chickens appeared.

These peculiar traits must have been inherited; they could not have been the result of education; neither could they have resulted from the difference in the natural characteristics of the breeds or from any distinction in their treatment. A brood of chickens which have "come by chance," will sometimes, by reason of the surroundings, habits of roosting, etc., remain separate from the rest of the flock, but in the case under consideration the surroundings were the same, except as the high-toned Wyandottes made the distinction.

J. W. G.

BANTAMS.

AT Fig. 204, 5, 6, and 207, illustrations are given of handsome specimens of the newer strains of Bantams. It is true that farmers seldom indulge in feathered pets, and yet why should not the farmer enjoy the beautiful and rare in nature as well as the merchant or professional man? Would not these little beauties add some life, some variety, and enough beauty to the farmer's home surroundings to pay for the little room and feed necessary to keep them? If you want to please the boys, and make them happy, give them something to care for, and thus teach them valuable points about poultry culture, and those habits of care and thoughtfulness which ownership always brings.

The Silver Sebrights (see Fig. 204) are an

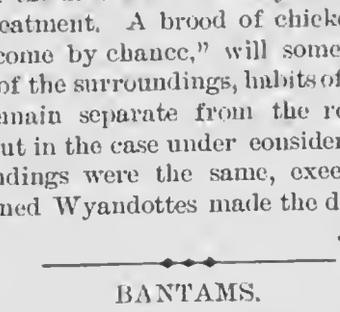

Fig. 204.

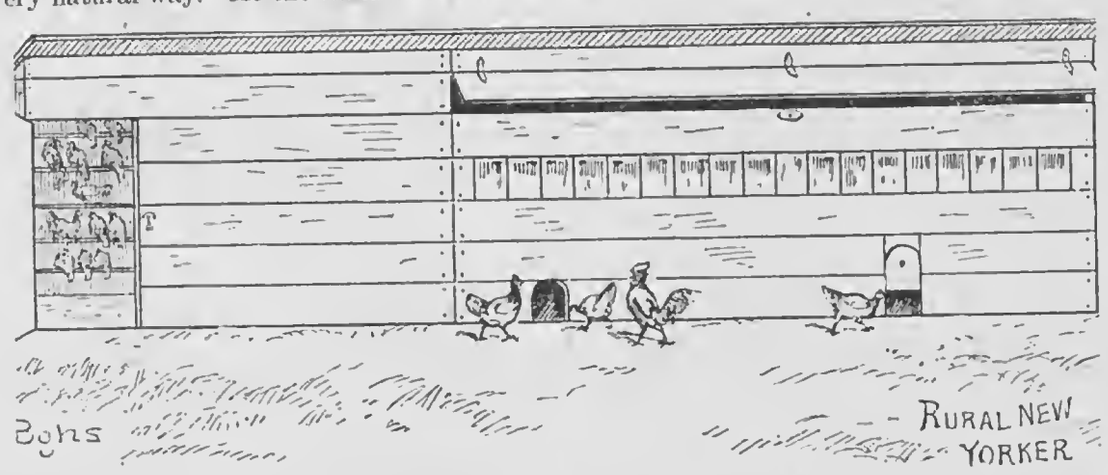
English importation and the result of nearly a lifetime of experiment in crossing by Sir John Sebright, and are the perfection of beauty in the fine, clear lacing of black around the edge of their white feathers, so even and true as to astonish us when we remember that they are entirely an artificial fowl. Their combs are rose, legs dark blue, and the cocks are the only males in the chicken kingdom having no sickles, but tails exactly like the hen's. Pekin Bantams (see Fig. 205) are of "Heathen Chinee" origin, and were first brought to England by an English officer, who took them from yards in the Emperor's palace grounds at Pekin, China, when that city was sacked by the French, in 1861. The pair we illustrate were imported from Shanghai, China. Except being relatively more compact, shorter in body and legs, they resemble Buff Cochins. The cocks, however, are richer in color, many being of a lustrous mahogany hue. Their combs are single and their legs and feet completely hidden with feathers.

Fig. 205.

If you are at all familiar with the oddities of things Japanese, you will not be surprised to learn that the grotesque little white fellows with black tails are Japs. "Mikado" and "Yum-yum" are the pair we illustrate at Fig. 206; both are imported. The stock all came from Japan a few years ago, and is the only contribution from

Fig. 206.



CHEAP HEN HOUSE. Fig. 197. (See page 303.)

that country to our list of fowls. Their wings often sweep the ground, so short are their legs. The tails are black; the sickle feathers of the cock are laced with edging of white; otherwise the feathers are pure white, except a few of the flights in wings.

The White Polish (see Fig. 207) is truly

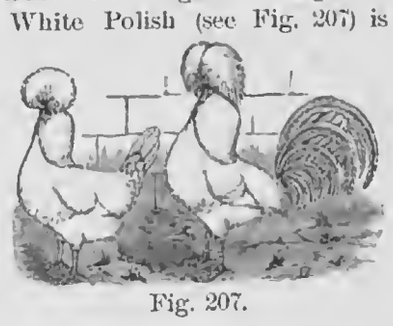


Fig. 207.

and entirely an American breed, and the result of perseverance in special breeding. They are miniature copies of the large, white Polish fowls, and have only of late years been introduced to the public, but they are still so rare as to command the highest prices. Bantams are easily raised, stand close confinement, and are generous in the supply of eggs, that are nearly all yelk, and especially rich and valuable for invalids.

Bantams are naturally tame, making the most delightful pets, and are always loved by their owners and admired and coveted by visitors. As we should not devote all our money and time to the severely practical, we think these beautiful birds have their place and their use.

THE USE OF AN ARTIFCIAL BROODER.

A YOUNG chicken needs only warmth for the first 24 hours after its birth from the egg. More chickens are lost by being crushed or chilled in the nest than by any other fatality. Every chick of a brood may be saved by the use of a very simple brooder in which the newly hatched nestlings or even the chipped eggs may be placed as they are taken from the nest, and kept at a temperature of 90 degrees until the whole brood are out, when they can be given to the hen in a coop. Incubators are not for the poultry rank and file. They may do for the professionals who have nothing else to do but watch the thermometer and sit up nights to keep the lamp trimmed and save the eggs from baking or chilling. But every one who has a dozen fowls should have a brooder, if only to avoid the misery of seeing poor weaklings crushed flat under the big foot of the fussy but well intentioned hen. And this is the way it is made.

A box (see Fig. 196) 16 inches square each way, is lined with flannel or carpet or hair boiler felt; it is covered with several thicknesses of the same material outside, and then

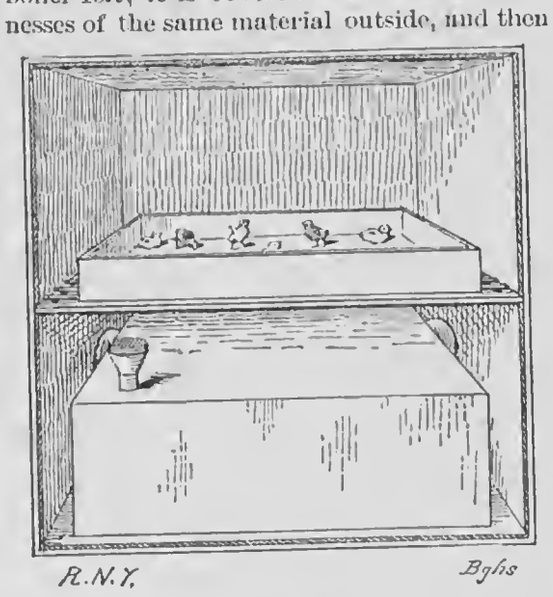

Fig. 196.

with an outer case like a second box. This is to retain the heat. A thick door is made for it, and a shelf is put across it half way. It then appears as in the drawing, the door not being shown. The door has a window in the upper part. The shelf is made of laths to let the heat up, and a nest-box, covered, for cleanliness, with paper, is placed on the shelf. Below is a tin box with a screw capsule, which is filled with boiling water. It is wrapped in a piece of blanket and is put in the lower part, and the heat is regulated by the use of more blankets over the heater to retain the heat, or by ventilating holes, closed with corks to keep the temperature at 90° or at 80° or 70° as the chicks get strong. I have kept a brood in such a warm closet for several days waiting for another one to come out, to double up the two in one coop, with one hen; and the chicks could just as well have been kept until they were able to be put into a coop by themselves. The chicks begin to pick crumbs of cracked wheat before they are six hours old, but they need to be taught to drink by taking one in the hand and dipping the bill in a little saucer of water, after which it will drink and the others will imitate it. There is nothing else that I know of that will so much please the young folks, even the baby, as one of these brooders, which may be kept on a stand in the sitting room, with its little family of chicks in it which amuse us by their cunning ways and funny tricks; nor is there anything that will tend more to make careful and successful young poultry fanciers. H. S.

CLEANING THE POULTRY HOUSE.

A GOOD way to manage daily cleaning of the poultry house, especially during the snowy weather, is to have the perches ranged along one side of the building, the floor under them strewn with straw enough to keep it clean, and that wall of the poultry house which is in the rear of the perches, fitted with a hinged shutter, opening outwards, the entire length of the perches. When this shutter is raised and fastened with hooks to staples above, a garden rake passed through the opening and manipulated with a little care usually brings the whole bedding, droppings and all, at one pull. An armful of clean straw is thrust in and spread under. With an old broom I sweep thoroughly along the edges of the opening, drop the shutter to, hook it on each end, and

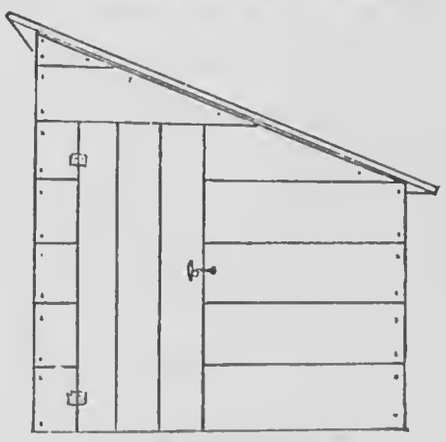

Fig. 199. (See page 303.)

my hen-house is cleaned, freshly strawed and ventilated in less than five minutes, and hardly a chicken is sufficiently disturbed to leave the roost.

My poultry house was originally made with boards nailed on up and down, but it took the carpenter only an hour and a half to tear the boards off that side, nail them crosswise, hinge and cleat the shutter and put on the hooks and staple, as shown at Fig. 194, p. 298, the hooks were made of old pail bails, and the staples were left over from the wire fence recently put up. The hinges were not mates, being old ones, two in number. The perches, of three stout poles, were arranged as shown at Fig. 195, p. 298. The place is always clean. In warm weather

he shutter is left open during the middle of the day. MRS. E. S. BINCOLN.

La Crosse Co., Wis.

CHEAP HEN-HOUSE.

THE hen-house shown at Fig. 197, p. 302, is cheap and convenient. The design us by Mr. J. S. Bennett. Where one can do the carpenter work himself, the house can be put up for $12. The building is 26 feet long and six wide, six feet five inches high in front, and four feet high at back. It is framed, 4x2 inch scantling being used. There are two rooms; the first, shown at Fig. 198, being 16 feet long and used for a place for laying, with nests arranged as shown in the illustration. The door opens at the end, as shown at Fig. 199. A ventilator, 1x16 feet, is hinged at the top. A row of glass panes, 12x10 inches, is fastened into grooved boards to admit sunlight. Two small outlets permit the hens to run out into the yard or to enter the laying room. The smaller room contains five roosts. There is a partition between the two. This house is made with ordinary boards with a board roof. It would pay better to make the walls double, with tarred paper lining, and to shingle the roof. Whatever adds to the comfort of poultry adds to the profit. It is not necessary to build a brown-stone front house for the hens, but it is necessary to keep them warm.

PERFECTION.

AT Fig. 190 (first page) is shown an admirable picture of the fine Langshan cockerel "Perfection." This bird was bred and owned by Robert Seaman, Jericho, L. I. At the late poultry show held in this city Perfection won first prize in "pair of chicks," also first in "breeding pen" and four special prizes. He is certainly a fine specimen of this promising breed. The RURAL has presented illustrations of the various breeds so frequently that we refrain from repeating them in this issue. In fact, the work of picturing and describing the various breeds has been so well done by breeders, that nearly all are familiar with them.

NEST BOX.

THE nest-box shown at 191 and 192, p. 299, answers admirably for either laying or hatching hens. It can be made of any size, of light, planed half-inch stuff. When in use for a hatching nest, as in Fig. 191, the door may be put up and fastened by a nail which is dropped through the edge of the roof, which extends about an inch over the front, as shown in the illustration. When it is to be used for laying hens, the door is dropped. Fig. 193 shows the back. The hole is bored with a ¾-inch augur and through it a nail is driven into the wall; so that the box hangs securely at a short distance from the floor. The spaces left in black are designed for ventilation. This nest is 14 inches square, the back 18 inches high, and the front platform eight inches wide

A HANDY COOP.

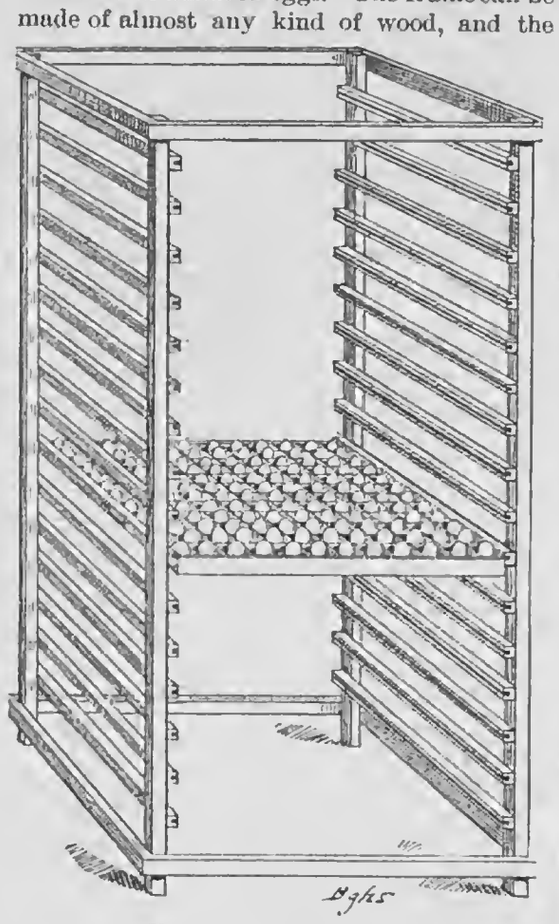
THE coop shown at Figs. 200 and 201, p. 300, requires but little explanation. It is 30 inches square at the base and 24 inches high. The frame is made of inch stuff about three inches wide. The lower part of front can be raised and fastened to a nail at the peak, as shown at Fig. 200. At Fig. 201 is shown the rear of the same coop. In this the door comes at the middle; it is six inches wide and held at the top by a wooden button. The coop is light and durable, has no bottom, and is easily constructed.

THE RURAL IN A NEW "ROLE."

WHY should a man pay money for an implement he can make himself? That was the thought which inspired the arrangement shown at Fig. 193, p. 299, for which we are indebted to Mr. T. H. Youngman, of Dakota. The paper is rolled carefully so that an egg will hardly go into the end. Hold the egg in place with the left hand, the little finger on the egg, the other three fingers on the paper. Hold the paper to the eye, and the testing is easy. Where eggs cost $5 per dozen with $2 added for express, it pays to look them over during incubation, and we think the above arrangement will answer. It will pay any man who makes anything of a business of raising chickens to examine the hatching eggs during every day of incubation. A few minutes spent each day at this work will quickly enable him to determine which egg to remove from the nest. Such a course will enable him to form a better set of rules than he can get from any book. Incubation is a delicate and rapid work. What more interesting study can there be than the formation of this little life.

A HANDY EGG-RACK.

THE sketch of the egg-rack shown at Fig. 202, was sent us by M. D. Earle, of this city. A convenient size is two feet in width and depth, and four in hight. Such a rack will hold several hundred eggs. The frame can be made of almost any kind of wood, and the



EGG RACK. Fig. 202.

egg tray may be either of strips of wood far enough apart to allow a resting-place for the eggs, or of paper divisions like those in ordinary egg cases. Heavy or "hardware" wrapping paper tacked on all around the outside, will exclude the air, and make it like a closet, a piece in front, one side of which should be left loose, will answer the purpose of a door. The eggs should be placed on end in the trays, and there should be an extra empty tray on which the eggs should be turned over now and then.

Miscellaneous Advertising.

That Tired Feeling

The warm weather has a debilitating effect, especially upon those who are within doors most of the time. The peculiar, yet common, complaint known as "that tired feeling," is the result. This feeling can be entirely overcome by taking Hood's Sarsaparilla, which gives new life and strength to all the functions of the body.

"I could not sleep; had no appetite. I took Hood's Sarsaparilla and soon began to sleep soundly; could get up without that tired and languid feeling; and my appetite improved." R. A. SANFORD, Kent, Ohio.

Hood's Sarsaparilla

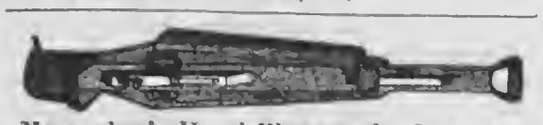
Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

THOUSANDS of business men are surprised because they suddenly break down; a catastrophe that would not happen to them were the blood kept pure and the kidneys in working order by Warner's safe cure.

Improved HYDRAULIC RAMS. Send for Circular and Price List. Address ALLEN GAWTHROP, Jr., WILMINGTON, DEL. Awarded Medal and Diploma at the Centennial Exhibition, Philadelphia.

TO FARMERS. This simple invention is used in milking cows, particularly where there is any soreness. Made of solid silver, and sent by mail to any address on receipt of the price, 50 cts. Address The Milking Tube Co., 102 Friendship Street, Providence, R. I.



Macomber's Hand Planter, *for Corn, Beans, and Beet Seed.* The BEST in the world. Money refunded if it does not prove satisfactory, after a fair trial. Agents wanted. Send for circular and terms. **S. M. Macomber & Co.,** M'f'g's, Grand Isle Vt. For Rhode Island address L. G. SHERMAN & CO., PROVIDENCE.

Batteries Attached to His Legs.

COLUMBUS, O., Nov. 4th, 1885.—Six years ago I was confined to the house. Doctor visited me three times a day, and often at night. Whole system uprooted. Pain in back and kidneys. Slept every night with galvanic batteries attached to legs. Medicine had not the slightest effect. Spent thousands of dollars. Was in this terrible condition two years. Took fifty bottles of Warner's safe cure and Warner's safe pills, gained 44 pounds and felt like a new man.—W. H. RHOADES.

DR. HUMPHREYS' Book on all Diseases RICHLY BOUND IN CLOTH and GOLD MAILED FREE. Humphreys' Homeopathic Medicine Co., 109 FULTON ST., N. Y. HUMPHREYS' HOMEOPATHIC SPECIFICS Sold by Druggists, or sent postpaid on receipt of price.

Stock and Poultry.

EGGS for sitting from Prize winning Wyandottes. B. L. HURD, Scuylerville, N. Y.

Wyandotte Chromo Free—Circular of leading varieties, Fowls, Ducks, Turkeys. Address with stamp. C. C. PAINE, East Bethel, Vt.

SMITH & WALKER, Lee, Mass. Breeders of twelve varieties of high class standard Poultry. Eggs cheap. Send for circular, free.

WYANDOTTE. P. Rock and Brown Leghorn Eggs, 10 cts. apiece; Bronze Turkey Egg, 3 for $3. Money Order Office Belvidere, N. J. A. LEDIA, Delaware, N. J.

PREMIUM WHITE LEGHORNS, COLORED DORKINGS and WYANDOTTES. Fowls and Eggs for sale. *Circular free.* S. K. WILCOX, P. O. Box 500. Smyrna, N. Y.

EGGS. Finest strain in the U. S. of Brown Leghorns. Price $1.50 for 13. FLEMMING BROS, Pittsburgh, Pa.

SILVER GRAY DORKINGS. First on Fowls and Chicks, New York Show, Feb., 1886. A few good Birds for sale. Eggs from pen No. 1, $3 per setting; two settings, $5.00. No. 2, $1.50. **WYANDOTTES AND CAYUGA DUCKS.** No circulars. Address, with stamp, HENRY HALES, Ridgewood, N. J.

PLYMOUTH ROCKS. A large, hardy, prolific fowl, suited to the farmer and villager. Stock thoroughbred. Have won Two First Premiums this season. Eggs, $2 per 13, packed for shipping. A. C. KILMER, COBBLESKILL, N. Y.

P. Rocks, Wyandottes and R. C. White Leghorns. We won every first and special on P. Rocks at Dalton, Mass., as well as first at every county fair where exhibited, first class certificate of merit at New York Show. High honors on Wyandottes and R. C. White Leghorns where ever known. Eggs $2 for 13; $5 for 40. SHAYLOR BROS., GOLDEN HILL POULTRY YARDS, LEE, MASS.

Poultry Raising Pays. Send stamp for *Illustrated CATALOGUE* describing **INCUBATORS,** *Poultry Appliances, and How to Succeed in the Poultry Business.* **L. N. CLARK & SON,** 38 Dey Street, New York.

POULTRY PRIZES.

One hundred dollars in prizes for two-column articles on poultry, to be published in the MIRROR AND FARMER, of Manchester, N. H. For particulars send for sample of the paper, which will be sent free.

PEDIGREE PLYMOUTH ROCKS. Pens headed by HANK WHITE BOYS, and ONTARIO CHIEF, with high bred females.

HULL WYANDOTTES. Pens headed by COL. LEB, LEBANON LAD, and COL. PURE. Send for circulars. BRADLEY BROS., LEE, MASS.

WYOMANOCK POULTRY YARDS. BREEDER OF Pure Wyandottes, Hull Strain. Langshans, Croad's Strain. I have a choice lot of each for sale in pairs, trios or breeding pens. Prices low for quality. Will give satisfaction. I won second on Wyandottes, third on Langshans, at N. Y. State Fair, 1885. Eggs, 3.00 per 13; $5.00 per 26. Try me. GEO. DELAVAN, New Lebanon, N. Y.

WYANDOTTES. Won Special on Highest Score and Third Premium on pair of Chicks at the New York Fanciers' Show in 1884. Won First and Second on Fowls and First on Chicks at Middletown, N. Y., in 1884. Won First on Breeding-pen of Fowls and First on Breeding-pen of Chicks, and First on pair of Fowls a Newburgh, September, 1885. FOWLS AND CHICKS FOR SALE. EGGS, $3 per 13; $5 per 26. DR. E. W. DEYO, Box 103, MONTGOMERY, ORANGE CO., N. Y.

DARK BRAHMAS. Won first on Breeding Pen of Fowls, first on Breeding Pen of Chicks, first on Pair of Chicks and second on Pair Fowls, at NEWBURGH, September, 1885. Fowls or Eggs in Season. EGGS, $2.00 per 13; $3.50 per 26. **Dr. E. Ross Elliott,** P. O. Box 267, MONTGOMERY, ORANGE CO., N. Y.

HULL STRAIN OF WYANDOTTES, ORIGINATED AND BRED BY **GEO. F. HULL,** NEW LEBANON, COL. CO., N. Y. At the recent New York Show the 20 birds in my four pens scored as follows: 91½, 93¾, 94, 93¾, 93¾, 87½, 92½, 93½, 92¾, 92½, 90, 93½, 93½, 93½, 92¾, 87½, 91½, 92½, 91, 92. Total 1843¾. Eggs, one setting, $1.00; two settings, $1.00; three settings, $10. This variety exclusively since 1872.

EGGS for HATCHING 24 VARIETIES. 32 separate flocks of Land and Water Fowls. Mated to produce best results. Large and handsomely illustrated catalogue free. ☞Mention this paper. J. L. MOCK, SOUTH HIGH ST., COLUMBUS, O.

J. H. THOMPSON, Jr., PATTERSON, NEW YORK. (ON THE HARLEM R. R.) Breeder of thoroughbred fowls and Pointer Dogs. From prize winning registered stock. 3 pens of Plymouth Rocks, 2 for production of pullets and 1 for cockerels. Eggs, $1.50 per 13; or $3 per 39. Also from 2 pens of Wyandottes. Eggs, $2 per 13; or $5 per 39. My stock is from the best strains and mated for the best results. I guarantee a fair hatch and safe delivery. A share of your patronage solicited, knowing I can please you.

Philander Williams, TAUNTON MASS., ORIGINATOR and BREEDER of the World-renowned Autocrat Strain. **LIGHT BRAHMAS.** "Improved Drake's Strain" PLYMOUTH ROCKS. "Imperial Strain" WYANDOTTES. EGGS—per Setting, $5; Three Settings, $10. Send for circular.

THE POULTRY MONTHLY CONDUCTED BY T. M. FERRIS. Best Magazine of its kind. $1.25 per year. Sample copies, 12c. Address FERRIS PUBLISHING CO 481 Broadway, Albany, N. Y. Liberal reduction on Clubs of five or more names.

HOW TO SUCCEED with Small Fruits and POULTRY. 35c. HOW TO PROPOGATE AND GROW FRUIT 50c Whole Fruit and Poultry business illustrated and explained. BOTH BOOKS sent postpaid for ONLY 50 CENTS. R. COATES, Norwood Park, Cook Co., Ills.

EGGS FOR HATCHING. PRIZE WYANDOTTES.—Puritan Strain, $2 per 13, and $3 per 13. LIGHT BRAHMAS.—$2 per 13. P. COCHINS.—$1 per 13; $7 per 26. My Breeding Birds score 90 to 96 points. First class Stock and good Hatch guaranteed. *R. COATES, Norwood Park, Ill.*

Watnong Valley POULTRY YARDS. **PLYMOUTH ROCKS.** Five first-class Breeding Pens. Eggs, $3 for 13; $5 for 26. **Imperial Pekin Duck.** Eggs, $2 for 12. Nicely shipped in baskets. Send for circular. EUGENE HILL, Littleton, N. J.

TEN YEARS' EXPERIENCE.

WYANDOTTES EXCLUSIVELY. Eggs, $3 per 13; $5 per 26. No more birds for sale this spring. No Circulars. Come and see what ten years of careful breeding will do. Visitors always welcome. S. B. HEMENWAY, NEW LEBANON, Col. Co., N. Y.

ELM TREE POULTRY YARDS. Silver Gray Dorkings. Long experience in breeding—no better table fowl—very domestic and good layers. Eggs $2 setting, and $1.50 for each additional setting. Also Agent for DIAMOND EGG BASKET, price 75 cts., 85 cts., 95 cts., and $1.00 per doz. Send for circular. RUFUS H. SHUMWAY, LEB. SPRINGS, N. Y.

PRINTING FOR POULTRYMEN! A poultryman writes: "Your prices are 10 per cent less than the lowest." Read this: 500 Envelopes, $1.35; 500 Business Cards, $1.00; 500 Gem Statements, 75 cts., etc. *Full line of cuts,* good stock, *new type,* fast presses, *low prices!* Patronage extends from Vermont to Colorado. Estimates given on Circulars, etc. Samples and prices for 2-cent stamp. "COURIER" STEAM PRINT, Chatham, N. Y.

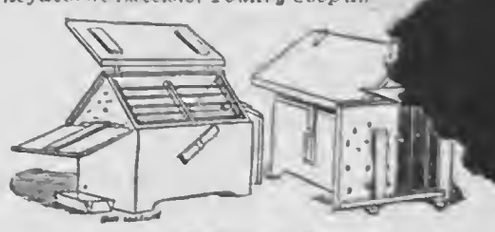
MONARCH INCUBATOR. Has taken First Prizes wherever exhibited My book, entitled "SIXTEEN YEARS' EXPERIENCE IN ARTIFICIAL POULTRY RAISING," will be sent free with each Machine. Send for circulars and testimonials. **JAMES RANKIN,** SOUTH EASTON, MASS.

HATCH The CRAIG Folding Incubator and Brooder (combined) will hatch from 1,200 to 1,500 chicks per year, worth as broilers from $4 to $12 per dozen. No cost or experience to operate. Holds 100 eggs. Price $12.00 An absolute success. Perfection of the **CHICKS BY** late successful imitation. No lamps to explode. Ten hens will pay $20 profit per year. Send 4c. for new 36-pp. book on poultry, incubators, etc. F. D. CRAIG, North Evanston, Ill. **STEAM**

PORTABLE POULTRY HOUSES.

Furnished all complete ready for occupancy. These houses are just what poultry breeders want, as they are ***Neat, Practical and Cheap.*** All kinds of portable houses suitable for all climates; ***rain, wind*** and ***water proof.*** Sent to any part of the world, and no carpenter required to put them together. ***Send for our Circular before you order a poultry house.*** AMERICAN PATENT PORTABLE HOUSE MANUFACTURING CO. Corona, Queens Co., N. Y.

NAPKNOLL'S PROGRESSIVE POULTRY COOPS FOR HENS AND CHICKS, WITH BROODERS AND INCLOSED RUNS. *The favorite Excelsior Poultry Coop and*



***PRICE* $6.** Gold and Bronze Medals were awarded at the Great Show of New York Fanciers' Club, February, 1886. Have you anywhere else in the world seen Chicken Brooders and Inclosed Runs that may at pleasure be either attached to or detachable from the coop? If you have not any such coops or brooders, send a two-cent stamp for one of the Illustrated Descriptive Catalogues, with terms and Price List. NAPKNOLL POULTRY COOP CO., GOSHEN, ORANGE CO., N. Y. THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MAY 8, 1886.

POULTRY SPECIAL.—20 pages.

WE count ordinarily on rye heads May 1st. This year the first rye heads appeared April 24.

MANY excellent articles from our best practical poultry writers are crowded out of this number. They will all appear later.

ALL poultry questions received to date, will be found answered under the Farmers' Club pages 308 and 309.

IF the number on your address label is 1893, your subscription expires with this number; if 1894, next week; 1895, in two weeks, etc.

MUCH depends upon which breed the male comes from. A Brahma cock mated with a Leghorn hen, produces a different fowl from that of a Leghorn cock and Brahma hen, though the blood in both crosses is the same.

NEVER cross two non-sitters. The progeny will sit. Remember this rule, which is that, no matter what the breeds used for the purpose may be, a hen produced by crossing any two breeds will always prove a sitter.

A HOUSE 10x10 will accommodate a cock and ten hens, or 15 hens alone, if the eggs are not intended for hatching purposes. It is safe to estimate that one dollar per head will be the cost for material of the poultry house. Hence, a house for 10 hens may be built for $10.

AFTER a pretty full consideration of the poultry contents of this paper, modified by the writer's experience of at least 15 years we desire to offer this bit of caution to those who propose to engage in poultry raising: commence in a small, economical way and extend the business only as a knowledge of the business increases and justifies additional expenditures.

WE believe that instead of using a feather or horse-hair loop to remove the worms from the trachea of a chick with the gapes, it is safer and more efficacious to wet the end of the feather with kerosene and not attempt to *remove* the worms at all. The kerosene will kill them. The feather should be very slender and inserted with great care. Turn it around once and then withdraw it.

IN the neighborhood of the Rural Ex. Grounds (New Jersey) the Leghorns are a popular breed for eggs. Most of the eggs are sold in the Paterson market, where a white shell is preferred. Leghorn eggs average large. On the 10th of April we weighed 13 Leghorn and 13 Wyandotte eggs. The Leghorns weighed one pound 14 ounces, or 30 ounces; the Wyandottes weighed one pound eight ounces, or 24 ounces. Such differences show that eggs should be sold by the pound.

THE advice given by all poultry writers is to whitewash the houses periodically as a guard against lice. The advice is good—but since we have adopted the plan of spraying our houses now and then with kerosene, there seems no reason for con-ing to whitewash them. A Wooda-me other spraying bellows (sold dsmen) will last for years. The them is very fine and pene-ry crevice. A house 10 feet an be sprayed in a minute or so.

IT is a great pity that poultry fanciers have not bred poultry with the object of increasing the egg production, by the selection of hens which lay the largest eggs, and the greatest number, instead of breeding only for certain markings. If any persistent effort in this direction has ever been made, we are not aware of it. There is no room for doubt that the egg product might be increased in this way just as surely as the milk production has been increased by the careful and long-continued selection of the best milk-producer among cattle.

THE suggestion made by several of our writers in this number, that it is better to have glass windows in the east and west ends of the poultry building, rather than in the south, seems to us a good one. The hens then get the early morning and late afternoon sun, when they *most* need it, while they get no sun at midday, when it is least needed. Equalization of temperature is the first requisite. Southern windows during bright sunshine raise the temperature in the buildings very high from ten A. M. until two or three P. M., while earlier and later the thermometer may sink below zero, thus subjecting fowls daily to the most violent changes.

ENTHUSIASTIC poultry fanciers are apt at times to overdo the business of inducing farmers to spend money in poultry. Such absurdly wild stories as are frequently printed concerning poultry profits do great harm. They bring into poultry culture the very people who ought to keep out of it. They drive away the practical farmers who see nothing but nonsense in the glowing statements. Why not be reasonable? Poultry keeping will never make up for poor farming, laziness, or bad management. The farmer who turns his whole farm into a hen yard will fail in nine cases out of ten. The hen will save no country or section; but she will help to save. Her proper place on the farm among the stock is as a helper and not as a principal. The egg product of the country can safely be increased by 50 per cent. without greatly reducing the price. The more prime poultry offered, the greater the demand. Farmers and their wives frequently complain to visitors of the difficulty of securing fresh meat in the Spring and early Summer. While they complain, a few poor hens are standing about the yard utterly unable, by reason of their owner's heedlessness, to supply the needed food. There are two things in the poultry business that are absolutely sure: no hen of any breed will lay when eggs are wanted, unless she is taken care of; the descendants of a hen that has been carefully bred for a special purpose will do far better work than any collection of scrubs.

"To kill two birds with one stone" might have been, with some appearance of justice, considered a praiseworthy feat in the Dark Ages, when the saying originated about the reign of Richard II. England was then thinly settled, and covered to a great extent with timber; stones were the chief missiles against birds, which multiplied greatly in a sparse population and a thickly timbered country where there were but a few crude devices for their destruction. Now deadly gun-powder has succeeded stones; the population here is much denser and timber much scarcer than in the England of those days. Then, how heavy is the aggregate destruction due to light-houses, electric and other lights, telegraph wires, pot-hunters, cockney sportsmen, and other bird-killing agencies unknown in the Dark Ages! Some years ago rural France was cursed with swarms of dandy "sportsmen" from all the large towns and cities and squads of imitators from smaller places. In spite of bad markmanship, the birds suffered severely at the cost of much gun-powder. The crops, too, soon suffered so disastrously that the Government had to intervene, and now stringent laws provide for the safety of the feathered friends of the farmer from one end of France to the other. A like experience has produced similar results in Germany. Is there not wisdom or business gumption enough in this country to learn a salutary lesson from the bitter experience of others?

THE introduction of yet another oleomargarine bill in Congress is threatened. The Bureau of the Internal Revenue seems to think it can improve on all the bills hitherto introduced by providing a general law applicable to all other adulterations and food compounds as well as to the "oleo" tribe. Outside of the agricultural papers, the general impression appears to be that no "anti-oleo" legislation will be passed at the present session of Congress. If this supposition proves true, the omission will be in great part due to the professed friends of such legislation—the men who, without consultation with other Congressmen, introduced, one after another, so many bills on the subject as to beget divided support, recrimination and confusion. To curry favor with their agricultural constituents these men have created a general impression that the dairymen of the country really know not what they want. Then, instead of all uniting in support of one measure, the dairy support is divided between the various bills introduced. Unless a prompt, united, vigorous and persistent pressure is brought to bear on Senators and Representatives alike, no anti-oleo bill will pass this session. We strongly urge all, therefore, to unite at once in support of the oleomargarine bill of the Committee on Agriculture.

SCALE OF POINTS.

THE guide in breeding the pure breeds of poultry is the "Standard of Excellence," which, however, describes only their forms, color, and outward peculiarities. This system is being abandoned by breeders of horses, cattle, sheep and swine, who recognize merit as belonging to certain strains or families, without regard to "outward points." While the Standard is useful in distinctly separating the breeds, and affixing to each those particular points in which it should excel as badges of purity, yet the highest scoring birds may be inferior, in a utilitarian sense, to others that may be deficient in beauty. A slight twist of the comb, a small speck of white on a black plumage, or the shade of a particular feather, may consign a really meritorious bird to oblivion.

The time has arrived when the poultry shows and agricultural associations should recognize true merit. A scale of points should be arranged for judging not only the live market fowls, but the dressed carcasses, and encouragement should, with those objects in view, be given to the crossing of the different breeds. It would be difficult certainly to decide upon the merits of individual hens as superior layers year after year, but this is the only way we could establish breeds of layers superior to any now known. We must select the most prolific hens and breed them to cocks that come from good layers. This will inevitably lead to the desired results just as the pit Games are bred for courage and endurance by ignoring the Standard and selecting only those that have been tried and tested. We can not see that the Standard of Excellence has ever aided in increasing good qualities of breeds in any way. There is now nothing in the score of a high-priced trio but beauty; still, without some kind of a standard, the breeding of pure-bred poultry would be impossible.

SPECIAL.

Those who, having applied for the Rural's present seed distribution prior to May 1st, have not yet received it, will kindly notify us by postal at once.

THE QUESTION OF THE TIMES.

FROM time immemorial the man on horseback has looked down on the man on foot; the man who toiled not for a living has contemned the man who "earned his bread with the sweat of his brow," according to the grim primordial curse. It was only after woeful centuries of suffering and blood that labor emerged from slavery to villainage and serfdom, and in only a few of the most advanced nations is the toiler of to-day on a par before the laws with his "betters." Ever since the parable of Lazarus and Dives the poor have been kept more or less contented with their wretched lot by the hope of reward for themselves and punishment for their taskmasters in another world. The school-master has been abroad, however, and the poor have to a great extent lost the simple faith that consoled their forerunners in their wretchedness. They yearn and clamor for some happiness in this life even at a sacrifice of a part of the hoard awaiting them in the next. "All wealth is the creation of labor," say the workmen, "but Labor has always been unjustly deprived of a fair share of its own creation. This injustice must end." The struggle to secure this fairer measure of justice has taken a more definite form of late than at any former time in the world's history. Never before was free labor so consolidated; never before was immense capital so concentrated in individual hands, and so organized by the league of vast corporations and plutocrats. The relation of labor and capital is the great question of the time. The struggle for a fairer adjustment will outlast the present and many future generations; but is bound to continue to agitate the nations until some satisfactory and just solution shall be wrought out after many blunders, bitter sufferings, heavy losses—but let us hope no bloodshed.

BREVITIES.

EVERYTHING in a hen-house should be as dry as a chip.

FOR low, damp soil, one should never select Brahmas or Cochins.

ONE objection to the Brahmas is that there is too little light meat.

MR. MANSFIELD tells the RURAL that the old American Dominique is as good a breed as any.

AS a part of our Poultry Special, the Domestic Economy Department must not be overlooked.

THOSE who have never fed purslane to their chicks are requested to try it as a succulent green food.

THERE are many city markets in which a higher price is paid for white-shelled than for dark-shelled eggs.

CLEAN saw-dust with a little sulphur sprinkled in it, is as good as any material for the nests of sitting hens.

IT will be seen that some of our experienced poultry raisers prefer not to have perches at all than to have them too small or placed too high.

THE RURAL NEW-YORKER was the first farm journal to praise the Plymouth Rocks and Wyandottes as all-purpose fowls, and this, too, as a result of experience.

WE have two ways of breaking a hen from sitting. One is to confine her in a small, dark box, three feet square, for two days, giving her fresh water only. The other is to place her in a small yard with a harmless dog.

APRIL 30. Among our entire collection of strawberries, Amateur, Parry and Iron-clad are the first to bloom, though May King is probably the earliest. Thus, it will be seen, it is not the first bloom that makes the first fruit.

MR. MANSFIELD expresses it, in another column, thus tersely: "The kind one keeps is immaterial." He is quite sure that more fail on account of over-feeding and giving damp quarters than from all other reasons combined.

AT the Rural Grounds we have fed our poultry bone meal (the pieces average nearly the size of wheat kernels) for four years. We never have soft-shell eggs. This is more digestible than broken shells, is more nutritious and furnishes more available shell material.

JUDGING from the Langshan eggs received last year and this for hatching, they will weigh scarcely more than those of the Plymouth Rocks. The color averages a little darker. Last year the eggs were sent to us during a cold snap, and none hatched. We hope to be more fortunate this season. We have tried nearly every other breed.

MR. T. B. HOOVER, a poultry raiser of long and careful experience, writes us that his Plymouth Rock pullets did not begin to lay as early last year by six weeks as the Winter before under the same treatment. His Crested Golden Polish have been laying well since the middle of February. We have tried this beautiful breed in a small way, but they do not seem quite hardy enough for our trying climate

If your hens are infested with insects, blow Buhach, Pyrethrum powder or Persian Insect Powder (they are about the same thing) among their feathers. Do this two or three times every week. We believe it to be the easiest, simplest and safest method of ridding the hens of this pest. Go into the hen house after nightfall and, taking them one by one in a gentle manner, blow the powder among their feathers through a Woodason bellows, or the little insufflators sold by most seedsmen; or, rub the powder under their feathers about the head and body.

THERE are farmers who always wait till the very last moment before ordering their farm implements. This is very poor policy. Such men always find fault. They will not take the fact into consideration that it takes time to do business. They wait until the time for using the implement and then order it sent "immediately." For any delay in freight or expressage, and such delays are frequently unavoidable, they blame the manufacturer. A little planning and "head work" would prevent all the trouble. We will venture to say that there are farmers at this time who have not secured their tools for the season. Order them at once. Never be caught behind-hand again.

SENATOR EVARTS has been receiving a severe lashing from the agricultural press because he was reported as saying that when a man made a failure he could only "go to a better world or come down to farming." The sentence may be taken either as an insult or a compliment. If the speaker meant that any "poor stick" who makes a failure of anything he puts his hand to, can by securing a farmer's outfit gain a farmer's dignity, he uttered a mean and unpardonable insult. If he meant that a man, beaten at every point in business, must come back to the farm for renewed health, strength and courage to enable him to make a new fight, the speaker used sound common sense.

THERE are two principal ways of accumulating competence—by making and by saving. Some make but little and slowly, yet by avoiding waste they eventually attain independence. When there is abundance, there is a propensity to waste. In most branches of business, men learn that dollars are made by taking care of the pennies; but the farmer, often burdened with the profusion of his crops, loses his profits through losing the odds and ends, or by the decay of produce not properly or timely stored. His work and care differ from those of most others, because of his dependence upon the condition of the weather, and in no occupation is there such constant occasion for forethought, and for adaptation of plans to exigencies as they arise. It is that farmer who keeps everything in trim, who completely finishes whatever he begins, and who anticipates leakage and decay, that sails along safely to the harbor of Prosperity.

POULTRY SPECIAL.

(*Continued from page 309.*)

Notes from the Rural's W. N. Y. Farm

POULTRY KEEPING IN ORCHARDS.

POULTRY AS INSECT DESTROYERS.

In consideriug the subject of poultry keeping, little is credited to them as insect destroyers. While all know that they are large consumers of auimal food, and that in Summer the principal part of this is composed of worms and insects, no attempt is made to turn this habit to good aecouut. While hogs or sheep kept in an orchard will destroy many insects and greatly help to keep them in check, they do so only incidentally, and for the sake of getting the infested fruit in which the insect may be lodged. Not so with an old hen and a brood of young chicks or ducks. They are ever on the alert, no iusect escapes their quick eyes, and they eat the "varmint" for its own sake, and no insect but is agreeable to their taste. One such family will destroy more insects than a hundred sheep or double that number of swine. In fact, very few have considered their great value for this purpose or have ever thought of making use of their potent help, and fewer still have made any systematic attempt to use them for this purpose, and yet, with a little thought, they can be so used as to be very efficient and be made a source of profit.

CHICKENS MAKE FAIR FRUIT.

We have for several years made use of this means, and we find the fruit of that part of the orchard in which they are kept very much fairer and freer from insects than that produced on other parts. So much have we been impressed with this fact that we are extending the system to the whole orchard. In order to have them all over the orchard we have constructed a number of high, cheap and warm houses. They are 8x12 feet; eight feet high on one side and five on the other. The sides and ends are made of matched lumber nailed to sills and plates of 4x4 stuff. The roof is made of strips on which shingles are laid. The whole of the inside is double-sheeted with tarred paper—the under part of the roof as well as the sides. A large window is in the south side and a door is placed on one end. Each is provided with roosts and nests and made in every way as comfortable as possible. Twenty-five pullets are placed in each very early in Spring, or they may be wintered there, and if desirable for breeding, a cock as well. As soon as one becomes broody, she is furnished with a clutch of eggs, either hen or duck, as desired, and when they are hatched she is cooped in or near the house until the younglings are a couple of weeks old, more or less, when they are allowed to run at large. Each night, at egg-gathering time, each lot of old fowls are fed a proper allowance of whole corn. This insures their "coming home to roost" and makes them so contented and happy that they never mix, even where the houses are not more than 20 rods apart. Of course, the chicks when young are fed oftener and on suitable foods.

LITTLE TROUBLE MUCH PROFIT.

All this takes but a small amount of time each day; while the results are very satisfactory in more ways than one. We get many hundreds of dozens of eggs, while the price is comparatively high. We raise from one to several tons of poultry which, by watching the markets, we sell at good prices, and which in reality have paid a fine profit, beyond the cost of raising, by the decrease of insects and the increased fairness and value of the apples.

By selecting the earliest hatched pullets for wintering over, we always have a large yield of eggs to sell during the scarcity and consequent high prices of Winter. While we make use of all the means to us known for reducing the number and depredations of insects, we know of no one means so perfectly and cheaply effectual as the keeping of poultry in the orchards.

After trying very many of the newer breeds of fowls at the farm, we have now fairly settled down to the conviction that none is in all respects equal to the Plymouth Rocks. They combine more of the following good qualities than any other breed we have ever tried—hardiness, early maturity, quietness, great prolificacy of good-sized eggs, even in Winter, and size of carcass. We think this emphatically a general-purpose fowl.

We select each year about 25 to 30 hens, in every way models, and with these we mate a cockerel as nearly perfect as we can find and as remote as possible in blood. In this way we have secured fowls as like as peas, the hens averaging about eight pounds, and the cocks nearly 12. In fact, it would be hard to find a finer show of this superior breed.

Winter eggs are produced from food and care. The hen simply acts as an agent. A perfect egg is a combination of warmth, contentment, cleanliness, clean food and drink and plenty of lime. With any one of these essentials omitted, the egg yield will be diminished. We think this states the matter fairly. A successful "chicken business" is but the careful elaboration of these propositions.

The conservation of warmth in the poultry house in Winter is an important problem in Northern latitudes. We are not speaking of the men who allow their poultry to roost in an old house overrun with vermin and searched by every cold wind. Problems never trouble such men, for no problem can exist without thought. There is no problem about the estimated profits of the live cold-storage poultry business. It is reduced to an axiom. Men who treat their poultry in a business-like way wish to find the most economical, yet warm, poultry house. We do not think it pays to keep poultry in the barn cellar. Dampness is death to fowls. The average barn is very poorly drained. What with the steam from the manure and breath from the cattle there is constant moisture. These old cellars are filled with little corners where vermin love to congregate. The fowls are worthy of a place of their own. The use of tarred paper for lining ought to revolutionize the life of farm poultry. A window is necessary. Ventilation must be secured. In the far North, a house built on the principle of an ice-house, with two walls, the space between which is filled in with saw-dust, is found to work well. Do one of two things before next Winter—kill off all your poultry at the first cold weather, or build a comfortable house for them.

We do not wish to give our readers the "poultry fever." We want to keep disease out of the family. You can't make your fortune at any business until you study it out, and oftentimes the mastery of the business is the only fortune you will see. There is money in the poultry business for those who "know how." There is no place on the farm where care and attention will bring so much ready cash as at the hen house. The point we make is this: there is a wider difference in usefulness between common poultry and improved and thoroughbred stock, than there is between scrub cattle and graded or thoroughbred cattle. No part of the farm stock can be so easily, cheaply and quickly improved as can the poultry. It requires years of waiting and a direct cash outlay to improve the farm cattle. In the poultry yard, care and observation can take the place of much of this cash. The want of cash stands in the way of many farm improvements.

It will pay to inclose farm poultry. They will be kept out of the garden. Fewer hens will be required. You can keep closer watch of them, and thus pay more attention to their improvement. You will save yourself the trouble of hunting eggs. The hens will be unable to foul the hay, the mangers or the door-yard. You will gain some respect for your poultry. You have no right to keep stock on your farm, that you cannot respect. If you could have movable coops and yards that could be easily moved about to different parts of the farm, you would gain in two ways—the summer food for the hens would cost less, and you would have less manure to haul out in the Spring. When the crops are out of the ground, the hens can have more liberty. Let them out on the plowed ground.

Tameness pays. You ought to have your hens so tame that you can pick them up as you would a cat. Bring them into such a state, and they will lay more eggs and put on more flesh to pay for it. Think of chasing a rooster half a mile, or running him down with a dog! We have seen intelligent men do these very things. Avoid it by gentleness and common sense.

Lice will gather in the laying nests if anywhere. Make the nests as simple as possible so that they can be easily taken apart and cleaned. Take out the old straw or hay every week or so and burn it up. Why nail a box together tightly and thus make cracks and corners where lice can congregate? Why not place boards loosely together on a shelf in the form of nests? Make the nests so that they can be taken apart at a moment's notice and thoroughly cleaned. At the South, boxes of cotton-seed are used as nests. They answer the purpose admirably.

Use care in selecting eggs for setting. Do you know which are your best hens? You could probably guess at it, but can you tell which of them lay the most eggs in a year? See if you can find out. If you can, pick out their egg for setting. Sort their eggs carefully. Reject all pointed eggs, all narrow eggs or those that are very large or very small. Aim to pick out "egg-shaped" eggs. Breed from your best hens. Would you raise a calf from your poorest cow?

How do you build your roosts? We want our roosts low, so that a hen can reach them without flying. It is not the business of a hen to fly or to run. We can make more by breeding any desire to perform either operation out of them. We want a roost at least two inches thick, oval at the top; the shape of bottom is of no consequence. We want the hen to rest comfortably without being obliged to clutch the roost so desperately.

Milk is one of the best of poultry foods. Mixed with the other food, given sweet as a drink, or fed sour and thick, it gives excellent results. It will take the place of meat to a great extent. A gallon of milk fed to the hens will give better results than the same amount fed to pigs.

The best breed? What would suit one would not suit another. We believe that location, means, characteristics of the farm, and the aims of the farmer must be taken into consideration. The different breeds of cattle seem specially adapted to different locations and farms. Experiments with the different breeds can be easily and cheaply made. In a few years one can decide which breed or cross is best suited to his wants.

Set the hens in a place by themselves. See that the nests are clean and free from lice before they go in. Give the hen all the eggs she can cover. Let her off every morning to eat and drink. Don't poke food in to her nest. Place a dust box near at hand, fill this with plain dry sand. Take a piece of chalk and write over the nest the date of the setting. Let the hen alone. Don't let the children plague her. Don't use a hen with scaly legs. As a rule old hens make the best mothers. Never pick out a hen that is naturally quarrelsome.

Poultry pay well in orchards. The shade is good for them. They pick up numberless insects and fertilize the soil effectually. In a plum orchard poultry will more than pay their way. There is no surer remedy for the curculio. Large hens are best for orchard work. They are less inclined to fly into the trees. With portable fences of wire netting the flock can be easily secured. The wire netting fences are becoming very popular. They are cheap, durable and sightly.

The best way to improve the common stock of the farm? The weight of opinion seems to rest in favor of buying fowls rather than eggs. It will be necessary to kill off all the old roosters. It would pay, if only one thoroughbred rooster was bought to confine him with the best hens, and use their eggs alone for setting. One thing is certain; if you will not take better care of the hens, it is useless to try and improve them. If you buy thoroughbred eggs or fowls, and think by putting the one under a hen or turning the other into the yard, the work is done, you will be worse off than before. You will not only lose your money; but you will be disappointed. Thoroughbred stock needs thoroughbred care. That is the "old, old story" of stock breeding. It is truer of poultry than of any other farm stock. Remember that while poultry can be more rapidly improved than any other stock on the farm, they will also most rapidly degenerate when neglected.

Never train roosters to fight. They will do enough of it without help. Still, if we were to kill off all but one, we should prefer to keep the master of the yard. There are too many roosters in the average farm yard. A single rooster confined with the best fifteen hens will insure eggs for hatching at the season when they are needed.

Grass is the best green food for summer use. It may be cut with a scythe and thrown into the yards, or, better still, there may be two yards, where grass can be growing in one while the hens are feeding in the other. Purslane is good for hens, and they relish it. For winter feeding, cabbage is hard to improve upon. Carrots, turnips, beets and lettuce are excellent. Chopped clover-hay is as good for the hens as it is for the cattle. One-hundred hens will make short work of a bushel of it. Feed onions sparingly. Apple parings, squash and pumpkin will help the hens.

Find out by your own experiments the best food ration for poultry. You have time enough in the Winter to notice which foods or food combinations produce the most eggs. Different breeds, in different localities appear to have different rations, each of which is claimed as the best. This shows that no one combination can be relied upon for all. Wheat must enter into very good egg ration, with green food of some kind. What is better for the morning feed than mashed potatoes, meal and milk and chopped clover? The potatoes can be boiled with those for your own breakfast. Feed whole grain at night. Give plenty of charcoal and burnt bone. Scatter whole grain on the ground, in different parts of the yard where the hens will have to work to get it. Feed soft food in a long narrow trough placed against the wall, so that the hens can eat from but one side, and not stand in the food. Scald this trough out every few days.

You can't tell from the outside of an egg, whether it will produce a rooster or a pullet. It wont pay you to try and form a set of rules on the subject. You won't make any more money, and you will know less about it when you finish, than you did before you began.

Hens need shade in Summer. Little chicks need it more than the old hens do. Have the water warm in Winter, but cool in Summer. Don't leave the drinking vessel out in the hot sun. Replenish it frequently and wash it out every day. This advice is not for those who wish to save work, but for those who want eggs and chickens.

The most contemptible man in all agriculture is the man who says poultry are of no use, lets his wife and daughter do all the work at raising chickens, and then puts the "egg money" into his own pocket. No wonder he is ashamed to enter the society of respectable hens. A man with a fair amount of common sense will appreciate the fact that the "women folks" can beat him at poultry raising. He will show his intelligence by encouraging them all he can, by eating his fried eggs and custards with a thankful heart, and letting the "egg money" go where it belongs.

A home-made incubator will give very poor results. The farmer will have very poor success with any incubator. These machines are for those who desire to go into chicken raising on a large scale. The average farmer cannot do this. His aim is to make the most he can out of his flock of 30 hens. He will find that the old hen will watch thermometers, turn eggs and keep lamps trimmed a great deal cheaper than he can.

Don't be barbarous with a broody hen. Don't tie her up by one leg or make her stand on sharp nails or in a pan of water. Put her in a coop raised a few inches from the ground with the bottom made so that she will have to roost on poles. Put her in a pen with a restless dog or calf that will frighten her into respectable ways, or let her go without food till she gets hungry, and then make her hunt her own living.

Cholera germs are taken into the system through the mouth. It is cheaper to kill the germs than it is to cure the hens. Think of eating eggs laid by hens suffering from cholera! One ounce of sulphuric acid in a gallon of water sprinkled about the yard and feeding places, is recommended to kill the germs.

Begin to fatten the Thanksgiving turkey on the day he is hatched. Don't wait till two weeks before the festival and then shut him into a coop to lay on a mass of blubber. Feed well.

Caponizing is a cruel operation at the best. Without doubt it pays well. The birds are made larger and of better shape, and the meat is improved in quality. There is all the difference between a rooster and a capon that there is between a bull and a steer. But the operation is cruel and useless to the ordinary farmer. Shame on the man who would experiment so cruelly on a live chicken. If you want to learn the process, study the anatomy of a dead chicken till you know where the parts are located. If you make bungling work of your first attempts, be merciful and wring the chicken's neck.

Eggs contain 12.5 per cent. of protein; three per cent., and corned beef 11.3 [illegible]

If you want flowers near the hen [illegible] sunflowers. The seeds are excel[illegible] in small quantities. Cut the he[illegible] the Fall, before the birds have a cha[illegible] plant the garden

Make your own whitewash and don't [illegible] afraid to use it on the inside of your henhouse: take a peck of salt dissolved in water, one-half bushel of well-burned, fresh quick-lime, and two buckets of boiling water. Place the water, the lime and the salt into a barrel and put on a cover to keep the steam inside. Make the wash about as thick as thin cream, and strain through a cloth. Soak a pound of glue in cold water. Add three pounds of rice flour and mix. Add this to the lime wash and put

in enough hot water to make the mass of the right consistency. Apply hot. It will be death to vermin and disease.

The houses should be sprayed with kerosene.

POULTRY STATISTICS.

In 1880 the number of poultry in the United States was 125,507,322. These produced 456,-10,916 dozens of eggs. Of this great flock 102,272,135 are classed as ordinary barnyard fowls, and 23,235,187 as improved or thoroughbreds. The disposition among the various States was as follows:

Alabama	3,017,698	Louisiana	1,490,907
Arizona	22,559	Maine	998,741
Arkansas	2,711,562	Maryland	1,457,725
California	1,510,167	Massachusetts	922,968
Colorado	128,804	Michigan	4,087,014
Connecticut	782,687	Minnesota	2,268,385
Dakota	302,491	Mississippi	2,907,733
Delaware	364,809	Missouri	10,966,153
Columbia	6,982	Montana	60,304
Florida	544,080	Nebraska	1,839,092
Georgia	3,442,583	Nevada	43,635
Idaho	86,021	New Hampshire	506,810
Illinois	11,525,071	New Jersey	1,473,765
Indiana	6,858,011	New York	6,945,292
Iowa	8,539,711	North Carolina	2,969,456
Kansas	4,397,482	Ohio	9,939,927
Kentucky	5,976,065	Oregon	490,895
Pennsylvania	7,360,856	Vermont	567,828
Rhode Island	269,759	Virginia	2,647,157
South Carolina	1,417,62-	Washington	147,129
Tennessee	5,404,721	W. Virginia	1,607,201
Texas	4,295,867	Wisconsin	3,815,726
Utah	222,616	Wyoming	10,167

The number of fowls to each inhabitant was about three, or nine dozen of eggs. Illinois is the great poultry State, having 11,525,917, yet this vast number gives but 230 to every square mile, or four fowls and 12 dozen of eggs for each inhabitant. Ohio produced the greatest number of eggs, 43,092,291 dozen. The New England States, where one would suppose the poultry business would be made the most of, had only some 37 per cent. of the fowls in the single State of Illinois, yet they produced nearly 80 per cent. of the number of eggs. Rhode Island had but 269 fowls on each square mile, or a trifle over six dozens of eggs for each inhabitant.

It is somewhat surprising to learn that the great bulk of our poultry lies in the West, and that it can be raised so cheaply there that dealers can ship to the East and realize a fair profit. In the space bounded on the south by Tennessee, the west by Kansas and Nebraska, north by Canada, and east by the Ohio River, may be found 50 per cent. of all the fowls in the country, while 43 per cent of the eggs were produced on the same area, which contained 14 per cent of the total area of the country, and 32 per cent of the total population. These facts are contrary to general belief. If western fowls were, as a rule, as productive as fowls in New England, or if New England had the fowls that are found in the single State of Illinois, one can readily see what the result would be upon our markets.

In the single State of New York, in 1880, there were 6,946,292 poultry; 610,358 horses; 1,437,655 milch cows; 901,866 other cattle; 1,715,180 sheep, and 751,907 swine. She produced 111,932,423 pounds of butter; 8,362,590 pounds of cheese, 31,958,739 dozen of eggs; while 231,965,533 gallons of milk were sold or sent to butter or cheese factories. There were 241,058 farms, and a population of 5,083,-810. This gives an average to each farm of 20 poultry, five cows, four beef cattle and three swine, or a trifle over one head of poultry, six-dozen of eggs, 22 pounds of butter, 10 pounds of cheese and 46 gallons of milk for each inhabitant through the year.

The value of the hen manure from a single bird for one year has been quoted at 15 cents. This is, we think, a very low estimate, and yet, even at this rate, the total value of the manure from all the poultry in the country in 1880 would be $19,000,000. The total values of the fertilizers manufactured during the same year was $23,650,795.

If we allow one egg every two days for each adult, and one egg every four days for each child, we would have with the population of 1880, as a basis, a home consumption of 650,-000,000 dozens, so that our home product must be increased nearly 50 per cent, in order to supply our own wants. We must increase the number of the present stock of poultry, or increase the productiveness of the present stock [illegible]proved blood and better care. The [illegible]tion of eggs rapidly increases from [illegible]ear. The carelessness and neglect [illegible]wners of farm poultry, prevent [illegible]ading increase of stock. The egg [illegible]never be adulterated. There is as wide a [illegible]stinction growing between fresh and stale eggs as there is between "gilt-edged" and common butter. What department of the farm offers better returns for care and enterprise?

At the Rural New-Yorker Farm on Long Island, we aim to keep about 75 head of poultry. These are allowed to range about the farm during the cold season, and during the growing season are confined in a yard 200 by 50 feet. In this there are a dozen dwarf apples (true Paradise stock) and 20 dwarf pears. A heavy mulch of the weeds which grow along the lanes and hedges is thrown in every Fall. This plan works very well.

What Others Say

POINTERS.

Pres. Needham stated before the meeting of farmers held a month or more ago in Boston and fully reported in the Massachusetts Ploughman, that he was talking with a young lady, a little time ago, and was astonished by her telling him that she had 50 hens, and that she could show him the figures by which it was demonstrated that she had netted $1.50 from each of these hens, on an average, within the last year. She is a lady of culture, a lady of a great deal of broad reading, and devotes herself to poultry as a matter of pastime and not as a matter of business.....

J. K. Felch, of Natick, Mass., said that Light Brahmas make as large broilers at nine weeks as other birds do at 12 weeks, and give the largest number of pounds for food consumed at the age of eight months, the most profitable time to kill them for roasters.....

The late hatch, he thought, would pay a better profit for winter feeding, and in March commanded a higher price for heavy weight poultry than any other breed. As winter layers, Mr. Felch gives them the first place. No other eggs rule as high in price, their large size and dark-colored shells commend them...

Mr. Felch rates the Plymouth Rock the second in merit of all breeds. Its first merit is as broilers. He says that this breed is a fair producer of eggs, and with good care in small flocks will give 132 eggs a year. The greatest drawback, he thinks, is the death rate among laying stock.....

The Wyandottes are susceptible to disease, Mr. F. thinks, far beyond the Asiatics. They may, however, be destined to rival Plymouth Rocks because their skin is more yellow, their bodies more plump and they carry more breast meat, which is appreciated in a broiler. The egg is as yet too small.....

Partridge Cochins, the most gorgeously attired in plumage of all the Cochins, are good winter layers, if not allowed to get too fat.....

Mr. Felch's formula for preparing meal for rearing chickens is, 20 pounds of corn, 15 pounds of oats, 10 pounds of barley and 10 pounds of wheat bran, to be ground fine and well mixed. He asserts that feeding this to chickens will give a pound extra weight in 12 weeks.....

Mr. Felch reckons that a bushel of corn expended in a variety of food will produce nine to 11 pounds of live poultry.....

He further says that to make the production of broilers a business, the incubator becomes indispensable. But for all that, to say incubators up to this time have been successful, is not a fact, and the greatest drawback in their success has come from the manufacturers of them, in that they have sold to whomsoever would buy, without regard to the purchaser's conveniences or ability to run them. They have asserted that any woman or child could run them. As the result of such want of suitable contrivances to care for the chicks when hatched, and want of experience in the operator, four-fifths of them have failed and to-day there are hundreds of incubators abandoned and stowed away among the rubbish of unused machinery.....

To run an incubator successfully the operator must become master of the machine. He or she must learn how to control the evaporation to secure the requisite amount of moisture; he must learn to run it with the lowest flame that will secure absolute control between 98 and 103 standard degrees of heat. If the machine constantly fluctuates to a degree far below or rises much above, the chickens hatch in a weak condition. If the machine reaches 115 degrees during incubation, the "death rate" will be from five to 60 per cent. as it varies in heat from 106 to 115, while this high temperature may give as good a hatch..

Brooders for from 150 to even 500 have been in use; these are being abondoned, and 50 is the largest number recommended to be reared together.....

Houses so arranged as to be cut up into small rooms, 5x12 feet, with open runs, that the chicks may go into the open air each and every day, must be furnished, even if they are not out five minutes. To try to raise them on the floor and wholly indoors is to fail.....

Mr. Felch predicts that a woman who will give her time and attention to become an expert in the management of an incubator and the care of the chicks, securing them in a healthy, growing condition to the age of eight weeks from this time on can secure a salary larger than she can secure in any other calling. He hopes that the ladies will read this subject up and act in accordance with this suggestion. He is often written to to secure such help and wishes he knew such experts to whom he could refer. Then, and not till then, will artificial incubation and the rearing of chickens become a success.....

During the interesting poultry talk among the farmers of New England, so well reported in the Massachusetts Ploughman, Mr. Hawkins asked Mr. Felch what size his Light Brahma broilers usually attain at nine weeks of age? Mr. F. replied that a pair would usually weigh four pounds. Mr. Hawkins said that he had broilers from Plymouth Rocks and Wyandottes last season that at 10 weeks old would dress 5¼ pounds to the pair. He asks if Light Brahmas make more desirable broilers as regards breast meat at that time? Do not the Wyandottes and Plymouth Rocks have fuller breasts all the way down from five to ten weeks of age? The Light Brahma can be killed for broilers when nine weeks old, but from the time they weigh two pounds, they have rather long legs and are thinner in the breast. Plymouth Rocks and Wyandottes at that age are very plump, with short legs and clean from feathers.

Mr. Felch agreed with Mr. Hawkins's statement that the Light Brahma can never be profitably killed during a falling market when from three to six months old; but the Plymouth Rocks and Wyandottes can be killed any day and profitably sold in the market. Oftentimes these breeds when four months old will bring more money than Light Brahmas at five months. But Mr. Felch insisted that no other breed is more profitable to keep through all seasons than the Light Brahmas..

If Mr. Hawkins could have all his chickens hatched in one week, he would select the first week in April. Then by the time they are nine or ten weeks old—say the 20th of June—they will bring 45 to 50 cents a pound dressed. He believes they can be raised for 20 cents a chicken, and if they will weigh 2½ pounds each they will bring 75 cents per chicken easily.....

Mr. Hawkins's best food for chickens is composed of corn and oats ground together and cooked in milk and broken crackers soaked in milk, using one-half of each. He gives this in a rather moist condition with no drink whatever for four weeks.....

Mr. Felch says that one Leghorn is on record as having laid 301 eggs in a year. He knew of one Leghorn that laid 159 days in succession. Mr. Felch commends the White Leghorn for warmer, more equable climates—California for example. The moment we strike the small breeds, unquestionably, Mr. Felch says, the Leghorn is the best breed for eggs, but in the cold North they are not good winter layers.....

Mr. Houdlette estimates that $1.25 to $1.50 is a liberal allowance for the cost of keeping one hen for a year where everything is purchased of the best quality and at the highest price. This is in confinement.

If he cared only for eggs, he would cross a Wyandotte cock on Plymouth Rock hens. A friend of his has kept that cross for several years with the most remarkable results. Most of the pullets of this cross are a lustrous black and the best layers he knows of. They have clean, dark legs, yellow skin and plump bodies.....

Mr. Houdlette favors also a cross of White Leghorn cock on Light Brahma hens. He would always use females of the larger variety. The fancy for yellow skin and yellow shanks is purely American and without any good reason; the white-legged and white-skinned Dorking is the English standard, you know. The Dorking, Houdan and Game are admitted the world over, when cooked, to have no superiors. Yet neither has yellow skin or legs.....

Eggs are as sensitive as butter or milk, and as easily affected by the food or water. Feed your hens onions to-day, and to-morrow's eggs will have the onion flavor and odor. The same occurs when hens feed on the manure pile and drink barnyard water.....

Mr. H. A. Mansfield is surprised that young men do not secure small farms, that can be purchased at a moderate cost, a short distance from market, and engage in poultry culture, instead of crowding into stores and factories.....

Mr. Mansfield further said that chickens can be raised with incubators and brooders, but it takes an expert to make a success of it. For farmers, he has no doubt that the cheapest, safest and best way is the old hen. Anybody can *hatch* chickens with an incubator, but it requires skill and eternal vigilance to raise them.....

Mr. James Rankin who has used incubators with success, said that there are a great many incubators in the market that claim to hatch chickens with perfect success. But they do not work well, and, hence deceive the public. Mr. Rankin commenced the poultry business over 30 years ago, and has given a deal of time to it. He can average $1.50 apiece clear profit on his hens. Since he has been using machinery in his chicken business, he finds he can double his profit from the same number of hens.....

Mr. Rankin's experience has taught him that, in growing poultry artificially, a yearly profit of 100 per cent. can easily be made on all capital invested in the shape of buildings, machinery, stock, etc. He has grown annually for the last 10 years from 3,000 to 5,000 ducks and chickens, for the early market, all of which has been done in connection with, and supplementary to other farm work. No other part of farm industry, he thinks, can compare with it in profitable returns.....

The first 20 years of his poultry experience were confined to the natural method, using hens alone—the next ten years hens and incubators were used side by side in the same building. The first part of that decade the hens were victorous; the latter part of the time mentioned, the machines took the lead and kept it. For the past six years machines have been used exclusively, the hens being kept entirely for egg production.

If he could make more money by using hens, he should do so. If he could not afford to raise 6,000 to 8,000 ducks and chickens by machinery, rather than by hens, he should use the old-fashioned way.....

Below is Mr. Rankin's balance sheet for the year ended September 1, 1883, on chicks alone as we find it in the Mass. Ploughman of March 20th.

Stock on hand September 1, 1882:

314 pullets at $1.25 each	$392.50
Supplies and food of all kinds	754.31
95 gallons oil	7.60
Total expenses	$1,154.41

Stock on hand September 1, 1883:

634 pullets and chickens	$ 536.50
1616 dozen eggs sold	533.28
302 hens sold	314.75
1434 chickens sold	1400.01
Total receipts	$2,784.54
Net profit	1,630.18

This showing gives a clear profit per hen of $5.20. The labor of caring for them is not charged, nor is the manure credited. The care of this poultry devolved entirely on Mr. Rankin. While his men were milking and feeding stock in the barn, he cared for chicks and machines, and seven o'clock found him at work in the field. With the exception of a half hour in the middle of each forenoon and afternoon devoted to feeding chicks, he did his share of field work with the others.....

Mr. Rankin then gives an account of his duck venture for 1885, which is a trifle more startling than the other:

Stock on hand January 1, 1885:

42 ducks and drakes at $1.50 each	$63.00
Feed of all kinds consumed	334.52
68 gallons oil at 8½ cents per gallon	5.78
Total expenses	$493.30

Stock on hand December 1, 1885:

206 ducks and drakes at $1.50 each	$309.00
Ducks sold	1503.71
72 dozen eggs sold	61.00
121 lbs. feathers sold at 50 cents	60.50
Total receipts	$1,934.21
Net profit	$1,530.91

Mr. Rankin has some 16 or 18 cows in his barn, and the neighbors call them good ones. The milk is sold at reasonable rates at a village some three miles distant at remunerative prices. He tries to run the thing economically and superintend it himself. He runs it as economically as possible, and yet he can clear more money with one-tenth of the labor and capital from each duck than from the best cow that he has in his barn.....

Mr. Rankin concludes that whereas poultry growers make only a profit of $1.00 to $1.50 per hen in the old way, by the proper use of artificial means they can make from $3.00 to $5.00 per hen, not including the cost of labor. Mr. Rankin alludes to a batch of ducks which came out in mid-March. There were over 400, and 98 per cent of all the eggs hatched.....

It should be borne in mind that Mr. Rankin has given 30 years to his work. He is an expert. Anyone working with him for a season or so, as Mr. Felch stated, might learn his methods and afterwards do as well.....

In the opinion of Mr. Houdlette, nothing will give fowls scaly leg so surely as sitting down or roosting or walking over their droppings. Gather the droppings every few days.

Is it profitable to keep the same hens over a year or two for laying purposes? Mr. Rankin's practice is to kill every hen the first of June. They then bring better prices than they would later or earlier. He prefers to kill them before they moult. Keep pullets only to produce the largest number of eggs...

Mr. Williams thinks that Asiatics become too fat after the first year. If you feed Brah-

mas all they want, they will not lay the second Winter. They grow too fat.....

PROF. COOK, of the Michigan Agricultural College, kept Brown Leghorns and Light Brahmas. He found the Brahmas superior as winter layers. Taking the whole number of eggs in a year, the Leghorns might excel a very little. If we count by weight, then the Brahmas are ahead. As to eating qualities, the Leghorns are smaller and their flesh is insipid .....

DUCKS, according to Mr. Felch, grow in ten weeks to weigh seven pounds and over. They seldom die. They can be kept in grass inclosures and fed four or five times a day with bread and corn meal, with ten per cent. ground scraps, and allowed to graze, they will weigh as above stated. They need not have water to swim in. They enjoy their food in a sloppy condition.....

MR. WARREN never kills his Leghorns as long as they lay, because they are worth more to lay than to kill. They will lay well until they are three or four years old. The best rule seems to be to kill all birds before one year old, or in June or July.....

TOO much glass was condemned by the leading speakers of the New England farmers' meetings. It causes sickness: the change of temperature between midday and night is too great. During warm, sunny, winter days, the thermometer will show 100 degrees of heat, while the nights may be below zero.....

MR. FELCH says that if we feed celery to ducks a week before they are killed, a flavor similar to that of the canvasback ducks will be imparted to the flesh ....

MR. RANKIN says, in the Poultry Keeper, that he has found the growing of ducks (artificially) for market, fully as profitable as growing young chicks, for as many pounds can be put upon a duck when nine weeks old, as on a chick at 19 weeks. Ducks, he says, can be grown at a cost of five cents a pound.....

A BUILDING 75 feet long and 12 feet wide, with a quarter of an acre of land, will be ample room room for 1,500 ducks. Mr. Rankin feeds the same as for chicks, with the exception of a little more animal food. He does not feed cracked corn or hard food of any kind until after they are five weeks old. The ducklings should be confined in a small run, with only room enough to exercise, and given just water enough to drink. They will readily fatten treated this way. He likes the Pekins best of all, as they are the best layers and mature the earliest. They will always lay their eggs in nests when given the opportunity. Their feathers also are by far the most valuable of any, as they readily command 50 cents per pound at wholesale. His chicken and duck buildings are 75 or 80 feet long and 10 feet wide, with no artificial heat. He uses just enough glass to heat the buildings when the sun shines, thus avoiding extremes. His yards occupy about two acres of land. The yards are subdivided by wire netting into small compartments of about 10x80. Into one of these yards he puts about 100 ducklings. The ducks are ready for market when nine or ten weeks old. They should then weigh from nine to eleven pounds per pair. He keeps ducklings in brooders about three weeks in early Spring, when the weather is cold, and about 10 days during the warmer part of the season.....

THE N. Y. Tribune calls attention to an incubator miscalled "Economy"—an aggravated sample of all the rest, so far as its knowledge goes. The Poultry Keeper says, "It is a worthless affair." An Ohio Farmer correspondent, after losing all his oil and eggs in repeated trials, declares it a complete failure and fraud, and cites experience and opinion of other victims to the same effect. This machine has been advertised and distributed by "H. S. Waldo, Quincy, Ill.," a name and address to beware of. This is the same rascal who sent out the Nature's Incubator denounced several times of late in the RURAL.....

INCUBATION BY IRRIGATION.—Mr. O. S. Bliss says, in the N. Y. Tribune, that a man had watched a setting of choice eggs with much solicitude till the 23d day of incubation, and still there was no sign of their hatching. Seeking advice at this stage he was told to put them into a pan of warm water, and leave them till they began to dance and then return them to the nest. Five hours afterwards he came with the joyful tidings that every egg had hatched. He said the moment they were in the water they danced like puppets. The lining of the shells had become so dry and tough that but for the wetting not one of the chicks would have been able to break the shell. Eggs in that condition absorb the necessary moisture almost instantaneously though they will not suffer injury from remaining in the water several minutes. Care should be taken to return the hen to the nest with the eggs to prevent the too rapid cooling from atmospheric exposure and evaporation.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a seperate piece of paper.]

IMPREGNATION OF EGGS.

J. D. N., New Brunswick, N. J.—Are all the eggs of the common hen impregnated by one effort of the male before the hen begins to lay, or are the eggs impregnated singly while she is laying? With a turkey hen, I know one "tread" of the cock impregnates the whole clutch.

ANS.—The matter of impregnation has received much attention from breeders, and the experiments made give no results forming conclusions. We have known eggs to hatch from hens that had been separated from the males for 10 days, and again, on changing to cocks of a different breed, the influence of the previous male has ceased on the third day. By using a White Leghorn cock, and a Houdan for comparison, the difference in the chicks may be easily noticed. The turkey fertilizes the whole clutch at a single meeting, which has been proved satisfactorily. Regarding the cock and hen, the accepted theory is that something depends upon whether the hen is served a few days before beginning to lay, or during the laying period—that is, there are times when a number of the eggs may be fertilized together, while at others the positions of the different eggs allow of only one to be fertilized. It is a broad field for future experiments. That the impregnation of the eggs from the first coupling influences all subsequent progeny is denied by some and affirmed by others. In viviparous animals or mammals there is an arterial circulation between the fœtus and the mother, but there is no such connection between the hen and the contents of the egg. The circulation of blood takes place within the egg shell and unconnected with the body of the hen. The young of mammals are hatched and nourished within the body.

ABOUT AN INCUBATOR.

G. C. C., Shespequin, Pa.—Where can the hard rubber expansion rods for incubators be had? 2. What is a thermostatic incubator? 3. What are a "pyrometer" and a "regulator."

ANS.—1. The hard-rubber expansion bars are usually made to order; but may be procured of any rubber dealer. L. N. Clark & Son, 38 Dey St., New York, sell them. No regulators are sold by any one to fit miscellaneous incubators; but they are made and sold as parts of special machines. 2. The Thermostatic Incubator is made and sold by E. S. Renwick, 19 Park Place, New York City. They will send circulars describing it. 3. A pyrometer is simply intended to take the place of a thermometer where a very high degree of heat is to be measured. It is sold usually at first-class opticians' or at other places where telescopes, thermometers, etc., are sold. If you have been so fortunate as to secure 93 chicks from 106 eggs, you would be unwise to attempt to use a regulator, as the best incubators are those that compel the operator to depend upon himself. Please send us a sketch and description of your incubator and brooder.

LEG WEAKNESS IN POULTRY: HENS EATING EGGS.

M. C. S., Centerville, Can.—1. My hens lose the use of their limbs. Sometimes they recover in a day or two; what causes the weakness? 2. Why do hens eat their eggs?

ANS.—1. Leg weakness or paralysis is occasioned by various causes, such as constitutional feebleness, sometimes from inbreeding; poor food; damp surroundings, etc. We know of no permanent remedy, as it generally recurs after one attack. Fowls need sound wheat and corn. Broken oyster shells and crushed bone are good to keep fowls in health, especially growing chickens. 2. Hens very rarely, if ever, eat properly shelled eggs. Animal food in the shape of scraps from lard-melting places, hazlets, etc., with the shell and bone as above, will generally assist in making strong shells, and prevent the vice.

ROUP IN CHICKENS.

J. H., West Granby, Conn.—My chickens breathe hard and fast and move as if they had the rheumatism; their appetite, however, is good; what ails them?

ANS.—The hoarse breathing is a form of "croupy" roup, due sometimes to draughts (perhaps from top ventilation) of air. It also occurs during long-continued damp weather. A good remedy is to subject them, until nearly suffocated, to the smoke of burning wood, tar and turpentine, after they are on the roost at night. A few drops of kerosene oil, forced down their throats from a sewing machine oil can, is usually efficacious. The weak legs may be due to dampness, too much fat, or rapid growth, if the fowls are young. Warmth and dryness are the best remedies.

KEEPING EGGS.

S. S., Delphos, Kans.—For "keeping eggs in warm weather," a dry process is to pack them in a box, using a layer of fine ashes between the egg, no eggs touching. Keep them in a cool place, pack none but fresh eggs, and be careful to turn the box twice a week. Eggs from hens not in company with roosters will keep twice as long as those that are fertilized. The wet process is to pack the eggs in a firkin or barrel, and cover them with a saturated solution of salt (strong brine) mixed with lime to the consisteney of cream. Another good and better mode is to add half a pound of salt and an ounce of salycilic acid to a gallon of strong lime-water. The eggs must be kept entirely immersed in the solution.

Subscriber (no address).—1. A cockerel was taken sick in September and died in February. His droppings were green striped with white, or yellowish green. He seemed hearty, but food did no good, and no remedy availed. What ailed him? 2. I hatched 12 ducks, but lost every one of them. They were all well till taken with a spasm, when they threw their heads around nearly behind them and fell on their backs. They would recover, but the attacks always returned until they died. What was the matter?

ANS.—1. The cockerel, most likely, died from consumption—a lingering sickness common to chickens. A tonic medicine will sometimes cure them if taken in time. 2. It is hard to tell what caused the death of the ducklings. If very young, sometimes a cold rain will cause such symptoms, or finding some uncongenial food in their rambles.

B. H. T., Union, N. J.—Is there any experience on record as to the inter-breeding of Plymouth Rocks and Gray Dorkings?

ANS.—Very seldom is a record made of crossings in poultry. The above cross would, no doubt, produce strong, large chickens.

T. W. L., Verona, Ill.—Corn-and-cob meal will not be objectionable feed for chickens; but corn should not be fed in any shape during the warm season, and only sparingly in Winter, especially to mature fowls, as it induces a tendency to become fat, which is detrimental to good laying. One part corn-and-cob meal with one part bran and one part middlings, is better. Wheat and oats should always be fed in preference to corn.

RANGE FOR SHEEP HUSBANDRY IN THE SOUTH; AVERAGE RATION FOR HORSES AND COWS; A "CORD OF MANURE," ETC.

R. H. Y., New York City.—1. How about sheep husbandry in Central Florida and in the same latitude elsewhere? 2. Given 20 work horses and as many milch cows, stable-fed and soiled, with no pasture, what should be the average consumption per head, per day, including a liberal supply of all kinds of feed? How near would 50 pounds per day come to it? 3. What is the average of wheat, rye, oat and bean straw and of corn-stalks per acre? 4. What is a cord of manure? 5. Is there any work which tells the various weights and measures of farm products and bye-products, etc.?

ANS.—1. Florida is not a desirable locality for sheep-herding. The heat and dampness of the Summer and the want of the right kinds of food will always be a bar to any extensive enterprise in this way. There are some sheep in Florida; but it cannot be called a sheep country. The Wire Grass region of Georgia; the southeastern counties; the southern mountain region, including Western Georgia; South Carolina, North Carolina and Eastern Tennessee, are remarkably favorable in locality and climate for sheep both for wool and mutton. 2. Fifty pounds of green fodder are quite inadequate for the sustenance of a horse or cow. The rule is 30 pounds of dry hay per day for 1,000 lbs. of live weight for simple maintenance; 50 lbs. of green fodder are equivalent to only 12½ lbs. of dry matter. The usual consumption of soiling fodder is 80 pounds per day for an ordinary cow weighing 800 pounds; and 120 pounds for a large cow. A horse cannot be kept in working condition on a sufficiently large quantity of green fodder, on account of his small stomach, and the larger part of his food must be grain; 25 or 30 pounds of green food and 20 pounds of grain are required for full feeding of a horse; 12 pounds of grain and 60 pounds of soiling will supply a cow of 800 pounds. 3. About 1,500 pounds of straw is the yield of the grain crops mentioned; 2,000 pounds per acre is a large yield of the grains and 1,000 pounds of bean straw. 4. A cord of ordinary manure weighs about two tons, and strawy manure that is not water-soaked will not weigh so much. A cord of solid cow manure weighs from 4,500 to 5,000 pounds. The weight depends very much upon the dryness or wetness of the manure. A car-load of horse manure containing, 600 cubic feet, well trampled, weighs 10 tons actual measure and weight, which is equal to nearly five cords and two tons per cord; 25 cords per acre is only very moderate. Mixed barnyard manure would easily weigh 25 per cent. more. Sixty to seventy-five tons of manure per acre are only a moderate quantity for a market garden and 100 tons are often used. 5. There is no such book. The information is contained in a number of works. Harris's Talks on Manures gives the weights of manures; but no rule can be given because manure varies so much in character.

ABOUT THE COMPOSITION OF MILK.

J. M. S., Watertown, N. Y.—1. What is the relative composition of milk for the different seasons of the year in regard to cream? 2. What is the effect in cheese making? 3. Does the quantity or quality of milk vary with the quality of food, or does the amount of cream remain nearly the same for a given amount of milk from the same cow? 4. Does the composition of milk change materially if a cow becomes farrow from what it would be if she had dropped a calf?

ANS.—1. The milk grows richer in cream as the fall season approaches and the feed becomes drier and more concentrated. If cows come to milk in the Fall, by feeding roots, silage, or other succulent food along with good Orchard Grass or clover hay, or a mixture of Timothy and clover, or with bright corn-stalks, milk very like that of June may be produced. If the feed is dry and concentrated, the flow will be less and the milk richer in cream. More depends on the feed and shelter than on the season. To get the best results, cows must be kept warm and have plenty of good, nutritious food. 2. As the milk grows richer in cream, it makes a richer cheese. Hence the custom in many cheese factories of letting patrons skim the night's milk after September. But this reduces the quality and value of the cheese. Perhaps buyers do not properly discriminate and make difference enough in price between cheese poor in fat and that which is very rich. The latter is the more digestible, and hence the more nutritious. A certain proportion of fat is necessary to aid in the digestion of the caseine. 3. Yes, most decidedly. Rich food—that is, food rich in nitrogen, with a proper proportion of carbon—makes rich milk. Watery food makes thin, poor milk. The relative proportion of solids to liquids may be greatly varied by the feed. But the relative proportion of fats to caseous matter can be changed but little, if any. Milk rich in cream is also rich in caseine; where the variation is caused by feed, both are increased or diminished in equal proportion. There is a difference in the proportion of fats to caseine in the milk of different cows, and no kind of feeding can vary this proportion to any material amount. 4. Yes, very materially. The fat globules grow smaller and the proportion of albumen is probably increased, making the milk more viscous and the cream more ropy. The change is sometimes so great that no butter can be churned from either the milk or the cream of a farrow cow. On the contrary, when the cow first drops her calf, the fat globules are the largest, the milk is the most limped and the churning most easy.

GRAIN RATION AND CUT FEED FOR HORSES.

C. O. U., Highland Lake, Col.—1. What is a proper grain ration for a 1,200 pound farm horse? 2. Is it advisable to feed grain alone for a midday ration? 3. Is anything gained by cutting the hay and mixing the grain with it, wetting the whole?

ANS.—1. No definite rule can be given for such a grain ration. No horseman orders the same rations for all of his horses. On the contrary, he carefully watches the needs of each animal and feeds accordingly. Much depends upon the general make-up and constitution of the animal, whether at work or idle, the care received, the surroundings and climate, and also the quantity of the ration of corn fodder as well as of the grain. In general, two to eight quarts three times daily may be taken as the extremes. While oats are probably the best and most natural grain for the horse when fed alone, it is much better to supplement the oats in part by some of the other grains. Any of the other cereals may be fed for the sake of a variety, the choice usually being determined by the kind at hand or the cost in the local market. An excellent method is to feed oats once or twice daily, and a ground mixture for the other ration. 2. It is better to feed a little hay or other coarse fodder first, especially if the grain is unground. The hay will take the edge off the appetite so

that the animal is not so likely to bolt his grain. Of course the grain alone is better than no ration, taking care to give ground feed when the animal does not well chew his grain. 3. We consider this one of the best methods of feeding the horse. Less hay will be fed and the horses will be kept in better working condition. This is especially true of "barrel or round-chested" horses and those that are inclined to be heavey or wind-broken. Farmers' horses during the Winter and at other times when partially or entirely idle, are very frequently fed too much hay. We make a practice of feeding no more hay (which should always be of good quality) than the horse will eat in one or two hours. Never fill a chute and allow a horse to eat all he can hold. It is both wasteful and injurious. When the horses are idle we recommend feeding clean bright straw and no hay, with a little extra grain. The cost will be practically the same. When the hay is cut, a bushel-basketful with which the ground feed has been well mixed and the whole then dampened (not wet) is ample for any horse of 1,200 pounds or under. An excellent ground feed for this purpose is prepared by thoroughly mixing two parts of ground oats, one part each of corn meal and wheat bran and one-eighth or one-fourth of one part of oil meal.

COLIC, BOTS, ETC., IN A HORSE.

H. K., Onawa City, Ia.—1. What is the best remedy for colic in a horse? 2. How can bots be got rid of? 3. One of my horses snagged his right fore foot two years ago, and ever since he can hardly travel on hard ground; but he goes along all right on soft ground. How should he be treated?

ANSWERED BY F. L. KILBORNE.

1. Much depends upon the cause of the colic. In general give ginger (one to two ounces) or peppermint oil (10 to 20 drops) with ammonium carbonate (one ounce) or one to two drams of sulphuric ether in one-half pint of oil. Belladonna (two ounces), aconite (30 drops), or chloral hydrate (two ounces) are excellent to relieve the pain of the spasms. Also one to three grains of morphine dissolved in pure water and given as a hypodermic injection. This is one of the best agents, since it will act in a few minutes when thus given. Common cooking soda is frequently given with success, but unless cautiously used is liable to cause rupture of a distended stomach by the sudden addition of gas, which is formed when the soda comes in contact with the gastric juices. Rectal injections of blood-warm water (two to four gallons) are very beneficial. Slow walking exercises, rubbing at the belly, or both, also afford great relief. In nearly all cases a dose of four to six drams of Barbadoes aloes should be given early, or at the outset, to aid in the removal of the cause of the colic. An excellent method is to give the aloes at the outset with the ginger or peppermint, and the belladonna or the hypodermic injection of morphine with rectal injections of warm water, followed by exercise or rubbing of the belly. Even after an attack has passed off, if the aloes have not been given, it is well to give a dose to carry away the irritant and thus avoid a second attack. 2. There is practically no cure, except to wait the pleasure of the bots to pass out, which they will do during the Summer. In Autumn while the larva are young and tender, they may sometimes be removed by any active vermifuge. Oil of turpentine (two to four ounces) diluted in oil or milk is one of the best. Later in the Winter they become encrusted with a hairy coat, and are then able to resist any agents that can safely be given to the horse. The introduction of the bots may be largely prevented during late Summer by trimming off the long hairs from the throat and fore limbs, and daily washing the limbs, throat and breast with strong soap-suds so as to remove the eggs there deposited by the bot-fly before they hatch and fall into the food or are removed by the horse when he licks himself. 3. Without knowing the extent and locality of the injury, we cannot prescribe.

WHEY FOR COWS.

G. W., Williamston, N. Y.—1. Is whey from a cheese factory a proper thing to feed to cows? 2. What kind of grain feed would be the best to mix with the whey for profit, and how much should be fed per day? 3. Would the whey affect the milk if fed to the cows clear in large quantities?

ANS.—1. Ordinarily, no. It is sour and contains little nutriment. If fed sweet—perfectly sweet—in small quantities, it might do no harm. 2. Wheat bran would be as good as anything to mix with whey. The quantity would depend on the need of the cow for additional feed, and on her condition. Two to eight quarts a day, or even more, would do no harm. The bran would be good for her at any time without the whey. Warm water would be about as good as sweet whey to convert the bran into a mash. 3. Yes, very seriously, if sour and stinking, as it usually is when it comes from the vat. It would give the milk and the butter or cheese made from it a whey flavor. Feeding whey to cows works much like feeding simple sirup or glucose to bees. The latter store up the sirup and glucose very little changed. The milk given by cows fed heavily on whey is little else but whey. Of course, the milk secretions are mingled with it, but it is poor stuff for milk. There is but little in whey but water and sugar which soon becomes acid and worthless. The sugar is carbonaceous, and helps keep up the animal heat. Cows secreting milk need nitrogenous food from which to elaborate it. Not only the casein, but the fats in the milk require nitrogenous food for their production. Hence the value of wheat bran, which should not, however, be the exclusive grain feed. It is better mixed with equal weight of corn-meal.

KNOTS ON APPLE TREES.

P. B., Sherwood, W. Va.—The trees in my apple orchard, just coming into bearing, are covered with knots towards the ends of the branches—something like those on cherry and plum trees, except that they are not black; what's the matter?

ANSWERED BY T. T. LYONS.

The description is very vague and imperfect; quite too much so to warrant a positive opinion as to the source of the trouble. The knots, or protuberances mentioned, may, and probably will, prove to have resulted from the attacks of the Woolly-louse of the Apple—Schizoneura lanigera (Hausm). Should this prove to be the cause, an examination last Fall would have shown, at the axils of the leaves and in the forks of the branches, patches of a woolly substance beneath which the insect might have been discovered. Its food is the sap of the tree, which it obtains by suction through punctures in the bark. It is, therefore, impervious to poisons; but may be destroyed by a vigorous use of a strong alkaline preparation applied and well rubbed in with a scrubbing brush, which must, of course, be done late in Autumn, or before the appearance of the foliage in Spring. The same insect, under a somewhat different form, often attacks the roots of the apple, beneath the surface of the soil, producing similar excrescences upon them. This enemy, although originally imported from Europe, is frequently spoken of as the American Blight.

DIARRHŒA IN COWS.

W. S., St. Catherine, Ont., Can.—Since diarrhœa is a symptom of disease rather than a disease of itself, the treatment should be directed to the disease or cause producing the diarrhœa. In general, carefully examine the feed and drinking water, and make sure that both are pure and wholesome. A change of feed is also frequently desirable. Medicinally, at the outset give one-half or three-quarters of a pound, according to size of animal, each of castor oil or raw linseed oil and Epsom salts. If there is no purgation in 24 hours, repeat the dose. In simple cases this will often be all the treatment necessary. While this mode of treatment may seem rather paradoxical to many of the readers of the RURAL, almost any physician will tell them that it is the proper course to pursue. In severe cases, gum-arabic, linseed, slippery elm, or oak-bark tea are excellent, given in the drinking water. If these do not succeed, give two to four drams each of powdered opium, catechu, prepared chalk and ginger, twice or three times daily, the size and frequency of the dose to be regulated by the severity of the case. Cease giving this medicine as soon as the diarrhœa is checked, and do not give it at all until after the oil and salts have been given.

BURNING STRAWBERRY BEDS.

M. D. S., Chews Landing, N. J.—What is the cheapest and best way to burn strawberry beds after picking? Last year the cost of straw and labor for burning, proved greater than the outlay for clearing the land in the usual way.

ANS.—If burning is resorted to, we would do as follows: Supposing the land to be free from stones, set the mower so as to cut close, and run over the rows lengthwise, leaving the cut foliage right on the rows; there let it dry sufficiently to burn readily. If that be insufficient, strew along the rows enough of the cheapest combustible matter available; chose a time when the wind blows lengthwise of the rows, and beginning on the windward ends, light all and burn over at once. The advantages of burning are to destroy weed seeds and insects. However, we prefer one good crop of large berries, and then to *rotate*, turning under the old vines; the second and subsequent crops are usually inferior in size and quality.

CYNTHIANA GRAPE.

J. M. T., Brick Church, N. J.—The Cynthiana Grape resembles Norton's Virginia closely, and is regarded by some as the same. It is said to be the best grape for red wine, which opinion appears to be confirmed by the fact that it was awarded the first premium as the "best red wine of all nations" at the Vienna Exposition. Bunch medium, compact, shouldered; berry medium, black, with blue bloom, sweet and vinous, with dark red juice, moderately juicy, very rich. Specific gravity of must, 118°. Vine a good grower, healthy and hardy; does not grow readily from cuttings, and will not bear much before the third year, when it becomes very productive. Not liable to any disease. Will bear best on spurs on old wood. We know not why it should not succeed with you.

SMUT IN OATS.

A. K., Hickson, Canada.—1. If smutty seed oats are sown, will the crop be likely to be smutty? 2. Would smutty oat straw be injurious to cattle? 3. Are white oats as liable to smut as black?

ANS.—All seed grain that was smutty last year should be steeped in a solution of a pound of sulphate of copper in four gallons of water; this is enough for five bushels of seed. The seed is put into a barrel or tub, and the pickle poured slowly over it. After standing an hour, the barrel is emptied on the floor, and the seed is shoveled over until all the pickle is evenly absorbed. 2. The oat-straw will not be injurious, as the smut is scattered and blown out in the thrashing, but it is advisable to cut the straw and wet it with salt water, and mix a little meal with it, and so feed it. 3. All oats are liable to smut if they are not treated to the copper solution above mentioned.

ABOUT OAT CULTURE.

H. M., Wabaunsee, Kans.—1. Should oats be run over with a smoothing harrow when they are four or five inches high? 2. How would you go to work to raise a very large crop of oats on a small area, without much regard to cost?

ANS.—1. It is hardly necessary to harrow oats in the Spring. Fall grain is benefited by a harrowing which breaks up the hard crust, loosens the soil and invigorates the young plants, besides furnishing an excellent seed-bed for grass seed. 2. To get a good crop of oats, we should plow in a liberal quantity of manure, sow the seed on plowed ground; harrow lengthwise of the furrows, and when the oats were well up, give a dressing of 100 pounds of plaster per acre. With this treatment and 2½ bushels of good seed per acre, we have raised 70 bushels to the acre.

SYNOVIAL SWELLING OR THOROUGH-PIN.

S. T. H., Eau Clair, Mich.—Shortly after weaning her colt my brood mare became lame. Both above and below the knee the left fore leg is swollen in bunches, which are soft like a wind puff: what should be done for her?

ANS.—Judging from the location, the swellings are not dropsical, but either synovial swellings or thorough-pin of the knee, due to a sprain. Apply a cold wet bandage loosely until soreness disappears. Then draw off the liquid with a fine hypodermic syringe, and apply the bandage tightly with pads on the swellings. A dry bandage with gradually increased pressure (the pressure should be slight in beginning) may be used without drawing off the liquid. With many blistering is a favorite method and is usually successful. Tincture of iodine applied twice a week will frequently reduce small swellings.

ASHES, ETC., FOR POTATOES.

A. F. H., Dansville.—Would hard-wood ashes, land plaster and salt, be a good application to sod land plowed last October, and intended for potatoes in May.

ANS.—The ashes will do good, but the land will also need bone and nitrogen. The land plaster and salt may do good—they may not. Except that the plaster contains lime, neither can be considered a plant food. As much plaster may be applied as you chose. It will do no harm. We should not use over 12 bushels of salt to the acre. The distance apart for potatoes, should be measured by the variety planted, and the richness of the soil. Rank-growing kinds in rich soil should not be planted less than three feet apart.

A. S., Tioga, Pa.—1. Having no manure or fertilizer and wishing to improve gravelly-loam, well-drained land by turning under a green crop in Summer, how should I proceed? 2. Would the pecan be likely to prove hardy here where the mercury sometimes goes down to 20° or 30° below zero? 3. Can the Japan Chestnut be grafted on the American, and where can cions be obtained? 4. Are apple seeds as good for nursery planting when taken from grafted as from natural fruit? 5. How can dried raspberries be prevented from getting wormy after being heated and put in air-tight cans? 6. How can Quack Grass be destroyed?

ANS.—1. Having but the few months of one Summer for the growth of the crop wanted, you must choose some annual, and it will only be able to supply some soft blades and stems in the brief time. Plants like clover, rye or common grass, which grow almost the whole year through and store up much solid matter, are much the most fertilizing. Probably either oats, buckwheat, or millet will serve you best. In turning them down avoid burying them very deep, especially if your soil is a heavy loam, as they are then liable to mold or sour, and become injurious to the roots of your crop. 2. If the tree would survive, it would not be likely to bear fruit. Still, we hear that trees are hardy fully as far north. 3. The Spanish Chestnut grafts on the American as readily as apples take on each other. Probably the Japan will prove equally facile. For cions send to Storrs, Harrison & Co., Painesville, O. The nuts should be fresh for planting. 4. In Europe they have an inherited objection for any other stocks for standard apple trees than seedlings of wild trees (wildings). Here it is found that the fewer and larger seeds of cultivated apples yield the thriftiest stocks, varying in hardiness just as all apple trees do. 5. The worms can issue only from deposited nits, and these should be killed by the heat applied to the fruit immediately before sealing up. 6. Turn it down in May or June—preferably the latter. Plow only deep enough to turn up all the white creeping stolons. Cultivate off every blade as soon as blades show themselves. A rake-like scarifier that will comb out the stolons and leave them exposed to the hot, drying, August sun, will finish them. Otherwise some of them may retain an ability to germinate, and make a weak show the next season.

G. H. B., Herne, Texas.—My mare was "covered" eight months ago; and since last Summer she has been discharging from the vagina a whitish matter not unlike buttermilk. She doesn't seem to be with foal, and does not keep in good condition. The least exertion or strain causes the discharge. What is the matter?

ANS.—The mare has a chronic catarrh of the vagina or womb. She is probably not with foal, and cannot become pregnant as long as the discharge continues. With the aid of a catheter or other small tube, draw off any liquid there may be in the organ, and then inject luke-warm water until the water comes out clear, draw off any remaining water, and inject the following solution, first making sure the zinc is well dissolved:—One dram sulphate of zinc, one-half glass of glycerine and one pint of water. Repeat the injection once daily, until all discharge ceases. Also give internally night and mornings one dram each of sulphate of iron and Barbadoes aloes, and one-half ounce each of powdered gentian and ginger; make into an oblong ball with sirup or honey, and administer by placing the ball well back on the tongue, and holding up the head until swallowed. Should the discharge fail to cease in a week or two, replace the zinc sulphate by one-half dram zinc chloride.

L. C., Omaha, Neb.—1. There is no necessity for sowing Blue Grass in the Spring. It would be far better to put the land in thorough condition and wait until August and sow the seed then, than to try to clear the land of timber and underbrush in time to sow it this Spring. 2. A stall three feet wide is rather close quarters for a cow. We give 3½ feet; if the cows are in stanchions three feet is a good distance, as it serves to keep the cows straight on the floor. 3. Which is the more profitable "to retail milk from house to house at six cents per quart, or deliver it at three or four places at 15 cents a gallon," where labor cost "$20 to $25 per month and board," will depend upon the distance the houses are apart. If it takes six hours to deliver 100 quarts of milk, the difference in price is quite lost, and the wholesale delivery is preferable. There is also a loss of about 10 per cent. in measuring out pints or quarts of milk from a can on a milk route. This is from actual experience of the writer.

T. H. B., Dudley, Wis.—1. How and when should grape seeds be planted? 2. What is the best chestnut for Northern Wisconsin.

ANS.—1. The best time is when the grapes are ripe, if one has greenhouses or sunny windows and a suitable temperature. They may, however, be planted at any time. If allowed to become dry, they are often several months in sprouting. You may plant grape seeds in the open ground as soon as the frost is out. A suitable protection will carry the young plants over winter.

Subscriber (address mislaid).—The expression "casting of the withers" in a cow owes its origin to the mispronunciation or corruption of the Latin word *uterus*—womb—by English country folks. "Wethers" or "withers" was the nearest they could come to the correct pronunciation! Hence "casting of the withers" means "casting of the womb" or "inversion of the womb," according to the common way of speaking. The common causes of it are violence or injury at parturition or in the removal of the afterbirth; sloping of the stalls backward; a relaxed condition of the pelvic organs, as from hot or unhealthy stables, digestive disorders, or other diseases.

(*Continued from page* 303.)

POULTRY AND POULTRY RAISING.

C. S. COOPER.

The best breeds: why? feed and feeding; how best to grade up; henneries; incubators, success with.

THE question as to the best breed is difficult to answer satisfactorily—about as difficult as selecting a wife. There may be 50 girls in a neighborhood, and a young man will select for his wife one that many others have passed by, because she suits his fancy: so it is in selecting a breed of fowls, each person has his favorite. Leghorns are generally kept by most farmers. Ask them why these are selected, and they will tell you they are the best paying birds on account of their great laying qualities. Are they not mistaken? First, they are not good poultry for table use; second, unless kept very warm and given daily nursing, they will not lay many eggs in Winter, when eggs are worth most; third, when fatted for market, they will weigh at the same age one-third less than many other varieties; consequently there is a loss of one-third in cash from the number of pairs sold. It is an admitted fact that half the chicks raised are cockerels, and they must be disposed of as market poultry with the aforenamed loss in weight. During my 29 years of farm life, I have given several varieties a fair trial, taking quality and defects into consideration. I have endeavored to obtain a breed of hardy constitution; these will lay most eggs in Winter. I believe in pure-bred stock; but if I were to cross, I should do so with either the Wyandotte or Light Brahma, preferably the Wyandotte for the following reasons: they are as docile and as easily confined as the Brahma, lay many more eggs under confinement, are ready for the spit at any time, are more toothsome, and mature much earlier.

My adult fowls are kept mostly on wheat; but two or three days out of seven, they are kept on oats, except the morning feed, when they get mashed potatoes. I also feed wheat bran, corn-meal and ground beef scraps on alternate days. A sprinkling of Cayenne pepper I find beneficial. My young stock I keep on corn and wheat mixed while they are growing, giving as much as they will eat without wasting. They are generally in a condition for market after they have been confined and thus fed for a week.

To grade up his stock at a small cost, a farmer can always procure at a reasonable cost one or more cockerels of pure breed; or, better still, he can procure two settings of eggs that will give him all the cockerels he needs for crossing, and have some pullets of pure blood to breed from. New breeds can only be produced by crossing. It is of slow progress, requiring from 12 to 20 years to breed true to feather.

In establishing a hennery, I would advise that dry land be taken—sandy or sandy loam, if possible. Chickens thrive best on such soil. Mud and pools of water generally produce disease and death. A hennery built on an eastern or southern slope, with the rear walls in the bank, is much warmer in Winter, and should be on soil naturally dry, or well underdrained. I prefer raising my chicks early in the season. They grow much larger; the culls can be sent to market, and command a larger price; they begin to lay eggs before Winter, and during cold weather eggs pay best. I have now about 250 as fine-looking chickens as can be found.

I raise nearly all my chickens with an incubator and brooders. Eleven days ago I removed 128 chicks from my incubator, and in the interval I have lost only four of the lot. They were weakly on leaving the eggs; now they are robust. Four days ago, I put 30 chickens with hens; now there are left only 18 of the 30. One of my hens hatched seven chicks on the same day I took the 128 from the incubator; now she has only five, and they are not so large as those brought up in the brooders. Evidently as "mothers," the brooders are better than the "biddies."

Bergen Co., N. J. C. S. COOPER.

BREEDING AND FEEDING.

THE Plymouth Rock or Wyandotte is the best fowl to use in crossing on the common stock of the country; because they are hardy breeds; are of good size; have clean, yellow legs, with plump bodies, and dress a golden yellow. They mature rapidly; are good layers, and are the two best general-purpose breeds living.

How shall we improve farm stock? is a hard question; but I would advise buying fowls instead of eggs to obtain birds to improve the original stock, or to embark in pure-bred poultry; because with ordinary care one has no chances to run, such as broken or bad eggs, poor hatches, etc. Yes, thoroughbred poultry will pay on the farm (providing birds or eggs are purchased from good, reliable breeders), as it costs no more to keep and care for such fowls than for common stock, while they will lay as many or more eggs, are handsomer and are always in demand at better figures.

We have found that winter laying is largely the result of good care, warm quarters, and early hatched pullets. There is no one food that is best suited for producing eggs. A variety is what fills the egg basket. In cold weather give a warm morning meal of three-fourths corn and oats, and one-fourth wheat middlings, seasoned with salt and occasionally some Cayenne pepper or eggine, with wheat, oats, buckwheat, or screenings of any grain, scattered among the straw on the floor in the henhouse to keep the hens busy through the day, and reward their labor with a good feed of corn just before they go to roost. I find this way of feeding very satisfactory while the birds are confined in winter-quarters. Besides this, they should have gravel, ground shells, and a feed of meat in some form every two or three days, if the very best results are expected. Hens are like all other farm stock—they will manage to survive on poor rations and in poor quarters; but if extra returns are expected, extra care must be given, and the large profits come with extra care. F. B. ZIMMER.

Warren Co., N. Y.

CARE OF TURKEYS.

THE turkey is tender when young, but hardy when matured. The greatest difficulty with young turks is when they are feathering: then they need an almost unlimited supply of food of the best quality, and variety. They feather so rapidly that they are soon able to fly, but this progress is made at the expense of a great loss of vitality. They cannot endure confinement, even when young, and the poultryman must, therefore, not only give them their liberty as soon as possible, but must not subject them to the loss of a single meal. The turkey hen is a very persistent sitter, requiring 28 days for incubation. She is a careful and attentive mother, and remains with her young until they voluntarily forsake her.

For the first 24 hours the young turkeys should be kept in a close box, quiet and undisturbed, in order to allow them to rest and appropriate the food derived from the yelks, which they absorb. They should then be fed on finely chopped eggs every two or three hours, for the second day, and after that time, a mixture of soaked wheat bread and milk, mixed with eggs and finely chopped onions will be excellent. Do not feed eggs longer than three or four days, but vary the food to mashed potatoes, cooked oatmeal, chopped onions, chopped meat and cracked wheat or corn.

Keep the hen confined in a roomy coop for the first week, and allow her to take her brood out for exercise; but she should be watched carefully, in order that the young ones may be fed as often as convenient, making meat and ground bone a special object in their meals. The young turks cannot endure the slightest dampness, and under no circumstances should they be allowed out of their coops until the ground is perfectly dry.

As a single union of the cock and hen fertilizes all the eggs of the latter for the season, the former will be serviceable for a dozen hens if judiciously managed. Turkeys cannot be kept under confinement or restraint, and require plenty of room for foraging. They will go over the highest fences and stray off for miles, and can therefore be raised only on large farms, or where there is room for them. The best variety is the large Bronze, which sometimes attains the weight of 40 pounds when two years old, though such weight is rather an exception. A cross of the wild and Bronze gives a very hardy turkey, and if the eggs are hatched under common hens with a few chicks as companions, the little turks can be encouraged to roost with the other fowls, and will lose much of their inclination to wander.

Turkeys are always profitable, as they require no care after they have passed the critical period, and although the strictest attention is necessary with them when they are young, when matured they endure greater cold and exposure than any other class of poultry; yet they give the best results when properly cared for. They are subject to both roup and cholera, but as they are in the fields the greater portion of their time, they do not come so frequently as other poultry in contact with filth and other causes of disease. While large flocks cannot be conveniently kept by every one, yet a few should be raised on all farms. P. H. J.

MANAGEMENT OF GEESE.

GEESE are great foragers, and although they are partial to ponds and streams, yet they should have an open range with plenty of grass. The goose seldom lays before she is a year old, and often the eggs from young geese do not hatch well. If the eggs are removed from the nest, she will sometimes lay as many as 40, but a smaller number is usually the rule. It requires about a month for the incubation of the eggs, and when the goslings are out of the shells, they must be kept in a dry, warm place for a few days, when they may be allowed in the fields; but under no circumstances should they be allowed near the water, as, contrary to the old adage, "water is not good for young goslings or ducklings." If this precaution is observed, there will be less loss. After they are 20 days old, they may be allowed to go with the old ones anywhere they prefer.

The food of young goslings should be rather bulky and soft. An excellent mixture is ground meat scraps, corn meal, bran, midlings, and ground oats, scalded and mixed with the same quantity of mashed potatoes or turnips, with chopped onion or grass added. A little bone meal or milk will also be of assistance, and when a month old they will require nothing from the owner but a feed of mixed grain at night.

The Chinese geese lay the largest number of eggs; the Toulouse are the largest, and the Embden the most attractive. The latter being entirely white, their feathers are preferred to those from the others. A cross of the Toulouse gander and Embden goose gives the best bird for market. Only young geese are able to realize the highest prices, but as the old ones are best for breeding purposes, age is no disadvantage.

Geese are profitable only when there is unlimited range, for they will not thrive in confinement. They are usually self-dependent, and being grass-feeders and not very choice in the selection of their food, they will not cost the poultrymen a large sum. A pot of turnips or chopped clover, with plenty of drinking water, and a feed of grain in Winter, will be all they require. They may be plucked twice a year, though some perform the operation oftener; but it is injurious, entailing upon them loss of vitality. They should have an open shed for shelter at night, and be protected from their enemy, the fox. H.

RAISING DUCKS FOR PROFIT.

DUCKS are very hardy when young, and grow faster than any other class of young stock. They require but very little brooding, and if fed all they will eat, with plenty of drinking water, they can be made to attain the weight of five pounds in ten weeks from the time they are hatched. They require mixed food, which should consist of meat scraps, mashed potatoes or turnips, and scalded bran, meal, and midlings. They come into market after the prices for early chicks begin to decline, thus extending the season for securing the highest prices. It is best to hatch chicks early and then follow with young ducks.

The favorite breeds are the Pekin, Aylesbury and Rouen. The first are easily kept in confinement, and require no ponds of water. The adults should have a large trough of fresh water, but ducklings should not get their bodies wet from the time they are hatched, till they are marketed, although until recently it was supposed that a pond of water was necessary.

The Pekins lay when five or six months old, and the favorite month for laying by all the breeds, is February. Plenty of nests should be provided, as ducks usually lay very early in the morning. In feeding, the cheapest mode is to give them plenty of bulky food. A lot of clover hay, chopped fine, scalded and mixed with mashed turnips, and thickened with bran and ground oats makes a delicious meal for them; but they should have meat once a day. Duck eggs command at the present time double the price of those from hens, and as they will lay as many as 140 a year, they are capable of yielding a fair profit for all that may be invested in them. The feathers are also salable, and usually pay for the labor of killing and picking them for market. The best crosses are the Pekins and Aylesburys. The Muscovy drake and Rouen duck produce a large and elegant carcass for market, but the produce is sterile, and a second cross cannot be made from it. When roaming at large, a pond and plenty of grass, with a good feed at night and warm, dry quarters, will keep the adult ducks thrifty and productive. J. H. P.

DUCKS.

IN regard to ducks the principal objection to all breeds is the grossness of their appetites. All the larger breeds, as the Pekin and Rouen, are gross feeders, and their eggs are but little, if any, larger than those of the Aylesbury. The latter will not come home at night as well as Pekins, nor are they quite as hardy. Rouens are not as good layers as either of the above; nor are they any better flavored, nor are any as fine-flavored as the Black Cayuga, which are a little smaller on the average, though their eggs are of about the same size; although they are the quietest, still, they are objectionable in color of plumage, not being easily found when straying away at night, as most ducks are apt to do at times. H. H.

CHICKEN NOTES.

THE cheap drinking fountain noted in recent RURAL, suits me exactly. I had one made from the illustration. I furnished the can and the tinman charged me 30 cents. I recently cured a hen of roup and another of blind staggers by giving two teaspoonfuls of alcohol in a little water three times per day, and forcing soft, warm food down their throats. F. C.

Leominster, Mass.

LANGSHANS AS WINTER LAYERS.—I have three Langshan pullets and one rooster that I raised the past year. I separated them from my other chickens on February 28, and from that day to March 18—28 days—they laid 67 eggs. Then one of them began to sit. All the house they have had is a dry-goods box about three feet square. Considering the weather we have had, I think this is doing pretty well. Seven eggs weighed a pound. G. B. C.

WYANDOTTES IN COLORADO.—Our friend Will D. Sawyer, of Greeley, Colorado, sends us the following practical poultry note: "I obeyed the RURAL and bought Wyandottes. When a neighbor drops in and tells about getting eight or ten eggs per day from a flock of 50 or 75 hens, I tickle him a little by telling him how I get four and sometimes five eggs from only six pullets about nine months old. First egg December 1; since then, 81 days, 196 eggs."

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

RIVERVIEW POULTRY YARDS.—Circular from A. C. Hawkins, Lancaster, Mass. Pictures of the Wyandottes which won the prizes at the New York poultry show are given, as well as of the splendid Plymouth Rock cockerel Perfection 2d. The "Hawkins Strain" is a famous one. The fact that it is advertised in many of the poultry catalogues is the best recommendation it could have. Send for the circular, and read the list of prizes won by members of this famous flock. The eggs are high-priced, but they come from prize fowls.

HOW TO SUCCEED WITH SMALL FRUITS AND POULTRY.—Pamphlet from Rob't. Coates, Norwood Park, Ill. A neatly arranged book of 110 pages, well illustrated and printed. The design of the book is to show that small fruit culture and poultry raising can be profitably combined on the same farm. This design is well carried out. The 40 pages given up to poultry, their feeding, breeding and disease, contain much sound advice. The book is sold at 35 cents.

HIGH-CLASS STANDARD POULTRY.—Circular from Smith & Walker, Lee, Mass. Wyandottes, Plymouth Rocks; Light and Dark Brahmas; Langshans; Hamburgs; Dominques; and Brown and White Leghorns are pictured and described. It is claimed that the Wyandottes; Brahmas and Plymouth Rocks are all of fine strains.

MAPLE LAWN POULTRY YARDS.—Circular from Wesley B. Barton, Pittsfield, Mass. Poultry and Scotch collie dogs are offered at fair prices. Agent for the "Simplicity Brooder," Wyandottes, Plymouth Rocks, Leghorns and Pekin ducks. An effort is made to deal squarely and fairly with customers. All eggs are guaranteed to be fertile, and all infertile eggs will be replaced. Send for the circular.

SILVER GRAY DORKINGS.—Circular from John L. Rice, Rensselaerville, N. Y. A short description of Dorkings and reasons why they should be secured. It is claimed that the Dorking produces the best and finest of all poultry meat, that the hens are fair layers, good sitters, good mothers and not roamers.

SAYBROOK VALLEY POULTRY YARDS.—Circular from Orson Winans, Oak Hill, Greene Co., N. Y. Wyandottes, Plymouth Rocks, S. C. White Leghorns and Bronze Turkeys are offered. The breeds are described and some space is given to methods of handling and shipping eggs.

MILL BROOK POULTRY YARDS AND KENNELS.—Circular from Wm. Montgomery, Jr., Bergenfield, N. J. Plymouth Rocks, Wyandottes, Langshans, Games, Leghorns, Houdans and Scotch Collie and St. Bernard dogs.

FORD BROOK POULTRY YARD.—Circular from A. F. Williams, Bristol, Conn. Light Brahmas, Langshans, Plymouth Rocks, Leg-

horns, Houdans, Wyandottes and Pekin ducks. The Langshans and Rose Comb Brown Leghorns are said to be particularly fine.

HIGH-CLASS POULTRY.—Circular from S. K. Willcox, Smyrna, N. Y. White Leghorns, Wyandottes and Colored Dorkiugs are the specialties. For list of premiums won, prices and testimonials, send for circular.

ELM TREE POULTRY YARDS.—Circular from R. H. Shumway, Lebanon Springs, N. Y. Besides the more common breeds, Silver Gray Dorkiugs and White-faced Black Spanish are offered. Agent for the Diamond Egg Basket.

THE PRACTICAL POULTRY BOOK, published by the Associated Fanciers, Philadelphia.—A little book of 100 pages given up to a description of the various breeds, and short hints as to breeding and feeding.

WATNONG VALLEY POULTRY YARDS.—Circular from Eugene Hill, Littleton, N. J. Plymouth Rocks and Pekin Ducks. The prize Plymouth Rock cock, Watnong Chief, is at the head of flock.

HIGH-CLASS POULTRY.—Circular from R. G. Buffington, Fall River, Mass. Erminettes, Wyandottes, Plymouth Rocks, White Leghorns, Light Brahmas and Pekin ducks.

BRADLEY BROS., LEE, MASS.—Plymouth Rocks and Wyandottes of first-class strains. The neatly printed card shows the excellence of the birds at the head of this yard.

WALNUT STREET POULTRY YARDS.—Circular from H. F. Ailing, Newark, N. J. Plymouth Rocks; Light Brahmas, and Brown, Black and White Leghorns.

WHITE AND BROWN LEGHORNS.—Circular from C. A. Peterson, Albany, N. Y. Pictures and descriptions of these famous "egg machines" are given.

BLACK JAVAS. Circular from N. T. Lattin, Gaines, N. Y.—Send for the circular and read the good points claimed for these promising fowls.

MERIDEN POULTRY ASSOCIATION, Meriden, Conn.—A well established association. Eggs and birds of all kinds in season.

BEES AND QUEENS, STRAWBERRY PLANTS.—Circular from C. Weckesser, Marshallville, Ohio.

ILLUSTRATED CATALOGUE of seeds from the Shakers' Seed Company, Mount Lebanon N. Y.—A well printed pamphlet of 80 pages containing a list of seeds for sale by the Shakers, as well as brief directions for planting and caring for gardens. The good standing of this company is generally recognized.

MACOMBER'S HAND CORN, BEAN AND BEET PLANTER.—Circular from S. M. Macomber & Co., Grand Isle, Vermont. It is claimed that this planter is the "simplest and best in the world," and that with proper care it will last a life-time. We have used it with excellent satisfaction, and can recommend it to our readers as a first-class article. The highest testimonials have been given as to its usefulness. The manufacturers state that in case the implement does not give satisfaction they will refund the money in every case where it fails to perform all that is claimed for it.

For Women.

CONDUCTED BY MISS RAY CLARK.

THE "LAY" OF THE INCUBATOR CHICKEN.

'Twas in an Incubator that
I first saw light of day,
Where I with many others
In my narrow egg-shell lay.

For one and twenty weary days
I boiled in slumber deep,
Till on the twenty-first I burst
My shell and 'gan to "peep."

Then 'neath a cheerful "brooder,"
Warmed by a coal-oil lamp,
They put us all so wet and small,
Out of the cold and damp.

'Tis fitly called a "brooder,"
For in it you may brood
On the fate that lies before you
When you're "ripe" enough for food.

You're fattened in this brooder
Instead of in a coop,
Until your crop's so full of food
You've got a case of "roup."

If haply you survive the ills
With which young chicks abound,
A full-fledged "broiler" you become,
Worth eighty cents the pound.

So little chicks, take warning now
While yet there's ample time,
And so you may escape the fate
Which I've here set to rhyme.

As soon as you are old enough
Fly off somewhere or other,
So that your young ones may not have
A "brooder" for a mother.

LADIES AS POULTRY KEEPERS.

BY ONE OF THEM.

IN many country places, ladies can try their hand at keeping poultry profitably. On the farm we find many things to do; we have much of the home-making to look after, all the things that add so much to the enjoyment and happiness. I think many who wish they had some way to have things to adorn and beautify the home, and a little independent income to spend as they like, can have it by keeping poultry. I would not advise making this all one's business, but taken as a part, adding gardening in all its nice variations, which makes a good companion for out-door work, and gives a fine profit on all investments. As a child, I loved the chickens, and late years have tried raising thoroughbred fowls of different varieties with very good success. I am a constant reader of the best magazines on this subject. My earnest attention has been given to it, and I believe that head, heart and hands, working together, will bring reward in all life's work, even though it be only rearing chickens. After making up my mind I could make money raising chickens, I looked up varieties to see what would do best here; after several trials, I found the rose-comb and pea-comb varieties seemed better adapted to this section of the country, as we have cold Winters, and a frosted biddie cannot give eggs. I have fair markets, but the greatest profit comes from selling eggs in the cold months. By my experiments, I find May-hatched pullets will not moult in the Fall, and they all will usually be laying by December, and be broody by April. So I hatch my chicks generally from middle of April to middle of June. March-hatched and sometimes April birds will moult late in the Fall, but the young cannot make a new feathering and lay eggs at the same time, so they make poor winter layers, are broody late, giving late chickens the next season, and these rarely lay well in Winter, but make good summer layers when a year old. I find this is not best here, because eggs are twice as high in Winter as in Summer. It is said one dollar will keep a hen a year, and a really good hen of any breed will lay two dollars' worth of eggs yearly. At this estimate, every hen gives one dollar profit, beside all the chicks raised from the flocks. After the fertilizer is bought, the market fowl and sale of feathers will pay for all the care. Purchase Leghorns in pens of 10—a cockerel and nine hens. I find the rose-comb gives the most eggs in the cold months, and as good in Summer. I have had the best strains of each and do not know of a better breed for eggs. The Light Brahmas I now have are giving perfect satisfaction in their egg record, and are superior market fowls. But there are Brahmas and Brahmas, I have found. There is a great difference in strains of the same breed. Many have selected what they admire most, and bred them until their idea of that variety of fowls becomes fixed, and so the strains are obtained. I bought some handsome Light Brahmas a few years ago, that had been bred to be non-setters, which they were, and the next thing to perfect non-layers—a hen that does not lay will not become broody. I cannot say that I have ever been satisfied with any single-comb variety of fowls. I have tried several standard varieties, and have a few nice Plymouth Rocks of noted strains; but they do not come up to my wishes or expectations. I should say for this State, the Light Brahmas for a large fowl; the rose-comb Leghorns for eggs; a cross between the Leghorn males and Brahma hens, never reversed, are a first-class, general-purpose fowl. They are called Diamonds, are good size, small rose-combs, prettily marked in some, pure colored in other crosses, excellent layers of large eggs, good broilers and fine poultry. With these two thoroughbred breeds and their cross-breed I can make money on a farm keeping poultry. Some like only one breed, but until we find that "ideal," one will not do for everything with me. I have also had some experience with turkeys; but the cholera has pretty well cleared them from this State. I like the Pearl Guineas, and keep a trio. They prove a good guard, giving the alarm to all when danger is near. I have also a trio of Rouen ducks; they do well. Many are trying their luck with ducks of the large breeds in this section. The dear, tiny Bantams make up my collection of fowls. It takes much study and patient watchfulness to become thoroughly posted on all points in poultry culture. I treat my birds with loving, gentle care, for I admire them and try to have them the very best of their kind.

Merrimack Co., N. H.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

POULTRY PITHS.

DON'T feed poultry for a day before killing.

The lower end of the breast bone of a *young* turkey will be soft and easily bent.

Geese are not fit for cooking after they are three years old—they are at their best when only one year old.

The meat of an old fowl is richer than that of a chicken, and is, therefore, better for boiling, for salads, and for made dishes.

When dressing poultry be careful not to break the gall-bag. It is situated near the upper part of the breast bone, and is attached to the liver.

Always add a minced onion to the stuffing of a goose or duck.

Young Guinea fowls are good, eaten either roasted or stewed.

Put a teaspoonful of soda into the water used for washing poultry.

A small pair of tweezers is an excellent instrument for removing pin-feathers.

When picking feathers from a fowl that has been scalded, place it with its head towards you, pulling the feathers away from you.

According to Marion Harland, there is no direr disgrace to our Northern markets, than the practice of sending whole dead fowls to market.

The secret of having a juicy, tender, roast turkey or fowl, is in basting it often and cooking it enough.

The cleaner the diet of poultry the more delicate the flavor.

"Green geese" are young geese that have been well fed and killed when from two to four months old. They are delicious eating.

Chicken feathers if properly treated will make pillows which are almost as light as those of geese. Use only the downy, entire feather, stripping all of the others from their shafts. To kill the rancid odor, wash through a warm water to which you have added chloride of lime—a spoonful to a gallon of water—and dry in an open oven.

The practice of dry-picking poultry while they are suffering their death throes, seems to us unnecessarily cruel.

A CHICKEN TALK.

ANNIE L. JACK.

ONE of the students of the family has just returned home from his winter session at school, and we had some fowls cooked in his honor. "Oh, turkeys!" he said, at which we all laughed for they were Plymouth Rocks, though larger than one or two of the turkeys we had used through the Winter. I like the above mentioned fowls better than any we have tried yet as a table fowl; but have often proved by experience that the good quality of a chicken depends as much on feeding as on breed, and a great deal depends upon the method of cooking. Fed upon grain and clean scraps from the kitchen, they will be better in flavor than if carelessly tended, and coarsely fed.

In our household we enjoy chicken fried, as is customary at the South. Cut into pieces, dip each piece into water, then sprinkle with flour in which salt and pepper have been mixed. Have plenty of lard in your pan and fry, with a cover over them, arrange on a hot dish when done and pour over the gravy, to which has been previously added a little cream thickened with flour. Pour this over the chickens and serve hot. Another method of using up boiled chicken, which is generally very tasteless, is to afterwards cut in pieces and broil; then make a sauce of mustard, vinegar, Worcester sauce, in proportions to suit the taste, boil together with a small bit of butter, and pour over the dished chicken. Some people prefer macaroni, and use rice with the chicken. And, again, it is put into the shape of lamb chops, egged and bread-crumbed and fried in boiling lard.

I think there is nothing that can be made into so many varied dishes as poultry, from the egg to the aged hen, that can be *slowly* cooked tender, if *stewed*, without any hurry. Farmers' wives who neglect to have early spring chickens, miss one of the very daintiest dishes, with which to treat their households in the summer months. With green peas or cauliflower, or any of the early vegetables, this meat is a delicacy, and it is something within the reach of all country people with the knowledge that they are fresh and good.

POULTRY FOR WISCONSIN.

THE breed of poultry which we have found to be the most desirable for table use as well as for eggs, is a cross between the Plymouth Rock and the native fowls. I suppose that stockmen would call them grades. The pure breeds seem to be too tender to flourish with the care that ordinary farmers can give them.

MRS. B. C. DUNLAP.

DAINTIES FOR THE DELICATE.

CHICKEN broth may be given to a patient recovering from a fever. Cut a fowl weighing three pounds into pieces, put into two quarts of cold water, and cook until the meat falls into pieces. Strain it, skim off every particle of fat, add two tablespoonfuls of rice and a little chopped parsley; if the patient is very ill, omit the parsley; simmer until the rice is done and the broth reduced to three pints. Never season too highly a soup intended for a sick person.

Mutton broth can be made in the same manner, allowing a pound of neck of mutton for each pint of broth. Put thin wafer crackers in the oven for a moment and serve them with these broths.

A very nutritious jelly is made with chicken and Ceylon moss. Make a chicken broth as above, adding four ounces of the moss when it is first put over the fire. Omit the rice and parsley, skim off the fat, season only with salt, and strain through a jelly strainer into small cups and eat cold.

A very tempting dish is made by reducing a quart of chicken broth to less than half that quantity by slow boiling; strain into a plain mold, and let it stand while you broil a neat fillet that you have reserved from the breast of the chicken. Season this, and put it into the mold of reduced broth, which must be placed on ice until it hardens. Turn out on a small oval dish and decorate with parsley.

PALMETTO.

BONED TURKEY.

IN answer to Mrs. V. as to how the above is prepared, we will republish the plain directions given in RURAL of Oct. 21, 1882. We would suggest that the novice make her first attempt upon a chicken, and judging from our own experience, she will have occasion to call into practice the good old saw "If at first, etc." "Get a turkey that has not been frozen—freezing makes it tear easily. See that every part is whole: one with a little break in the skin will not do. Cut off the legs in the joints, and the tips of the wings. Do not draw the bird. Place it on its breast, and with a small, sharp, bowing knife, cut in a straight line through to the bone, from the neck down to that part of the bird where there is but little flesh, where it is all skin and fat. Begin at the neck and run the knife between the flesh and the bones until you come to the wing. Then cut the ligaments that hold the bones together and the tendons that hold the flesh to the bones. With the thumb and forefinger press the flesh from the smooth bone. When you come to the joint, carefully separate the ligaments and remove the bone. Do not try to take the bone from the next joint as that is not in the way when carving, and it gives a more natural shape to the bird. Now begin at the wish-bone and when that is free from the flesh, run the knife between the sides and the flesh, always using the fingers to press the flesh from the smooth bones, as, for instance the breast-bone and lower part of the sides.

Work around the legs the same as you did around the wings, always using great care at the joints not to cut the skin. Drawing out the leg-bones turns that part of the bird inside out. Turn the bird over and proceed in the same manner with the other side. When all is detached, carefully draw the skin from the breast-bone, then run the knife between the fat and bone at the rump, leaving the small bone in the extreme end, as it holds the skewers. Carefully remove the flesh from the skeleton, and turn it right side out again. Rub into it two tablespoonfuls of salt and a little pepper and fill with dressing. Sew up the back and neck and then the vent. Truss the same as if not boned.

Take a strong piece of cotton cloth, and pin the bird firmly in it, drawing very tight at the legs as this is the broadest place, and the shape will not be good unless this precaution is taken. Steam three hours, then place on a buttered tin sheet, which put in a baking-pan. Baste well with butter, pepper, salt and flour. Roast one hour, basting every ten minutes and twice with stock. When cold, remove the skewers and strings, and garnish."

DOMESTIC RECIPES.

FRICASSEED CHICKEN.

JOINT your chicken nicely, put into a pot and nearly cover with boiling water, adding salt and pepper, allow one-fourth of an hour for each pound, and boil slowly. When done, thicken the gravy with flour wet with cold water, boil a minute or two longer, then serve on a platter lined with nicely toasted home-made bread. If a nice biscuit crust is added

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

about one-half hour before serving, you will have a delicious pot pie.

JELLIED CHICKEN.

ANY meat which may be left over makes a nice relish treated thus. Pick all the meat from the bones and chop fine, add the gravy left and season well, simmer for one-half hour, If you think it will not jelly, add some gelatine, first soaking it in a little cold water; boil a little longer, then turn into a nicely shaped dish or mold, which has been wet with cold water, put it in a very cold place or on ice to harden, when ready to serve, turn it on to a platter or plate; if you have parsley, garnish it with a few leaves. AUNT EM.

A GOOD WAY TO COOK AN OLD AND TOUGH FOWL.

CLEAN and divide, and put into a sauce-pan with a half pound of lean salt pork cut into pieces. Just cover with water, and cook slowly two hours. Then stir in a large minced onion, a half spoonful of powdered sage, a little parsley and pepper to taste, adding salt if needed. Continue the slow stewing, adding water to prevent burning, until tender. Then add a teaspoonful of brown sugar and a tablespoonful of browned flour, previously wet with cold water. Boil up and serve.

FARMER'S WIFE.

FRIED CHICKEN.

DRESS and cut up the fowls, and parboil them, until they are nearly done, then drain from the liquid and fry in good butter, turning them often until they are of a nice light brown and tender, when they are ready for the table. The liquor in which the fowls have been boiled (which should be previously seasoned with salt and pepper), may be thickened with some butter rubbed into a little flour for gravy. A few biscuits made of half cream and half buttermilk, baked, and while hot split open and put in the kettle of gravy about five minutes before it is served, make an excellent accompaniment to the chicken. All but the cook who is a born genius, will have better success with this than with hot pie dough cooked in the liquor. The biscuit will always be light, and the general result very satisfactory. AUNT RACHEL.

A SIMPLE WAY OF PREPARING BONED TURKEY OR CHICKEN.

BOIL a turkey or chicken in as little water as possible until the bones can easily be separated from the meat. Remove bones, gristle and skin, cut into small pieces, mix the light and dark parts, and season with pepper and salt. Boil down the liquid in which the fowl was boiled, skim off the fat and add a small spoonful of gelatine that has first soaked in a quarter of a cup of cold water. Boil up and turn over the meat, press into a bowl and set aside until firm. Serve cut into thin slices. One must use a very sharp knife.

MRS. A. VAN D.

BROILED CHICKEN.

NEVER attempt to broil an *old* chicken. Unless you *know* that the chicken is young, it is best to make sure of its being tender by giving it a preliminary cooking in the oven. Fill a dripping-pan with boiling water, place two or three sticks or a wire broiler without a handle on top of the pan, and place the chicken over the hot water. It should be carefully dressed and split down the back. Cover with a pan and steam half an hour, then transfer from the oven to the gridiron. Broil about half an hour, turning several times. Butter, pepper and salt, and send to table smoking hot. TOM'S WIFE.

CHICKEN PUDDING.

CUT up into small pieces and parboil with seasoning until almost tender. Take out on to a platter to cool, and set aside the liquid in which the chicken was boiled for the gravy. Make a batter of a quart of milk, three cups of flour—sift two teaspoonfuls of good yeast powder through the flour—three spoonfuls of melted butter, a little salt and four eggs well beaten. Put a layer of chicken in the bottom of a bake dish, barely cover with the batter, then another layer of chicken, and more batter until the dish is full. The batter must form the crust. Bake an hour in a moderate oven. Remove the fat from the liquid set aside, thicken with a little flour made smooth in water, add more seasoning if needed, and turn into a gravy boat. Chopped parsley, minced pickle or hard boiled eggs cut into slices may be added to the gravy if liked.

MARY B.

FRICASSEE AND FRIED CHICKEN.

AFTER the chicken is nicely dressed and washed, it is cut into pieces and put into clean, cold water, with a small handful of salt thrown in, where it stands for an hour or more. When it is desirable to put it over to cook, a quart or more of water is put into the kettle, with the chicken, and when it comes near to boiling all impurities are skimmed off, and then it is allowed to cook as rapidly as possible. If it is a young fowl, it will be tender in an hour. (If an old one it will take much longer, require more water, and will be greatly improved by adding a half teacupful of vinegar when first put over the fire.) There should be but a few spoonfuls of the liquor left in the kettle, when the chicken is cooked. A lump of good butter the size of an egg with about three tablespoonfuls of flour, are worked into a smooth paste, then a little warm water is added, so that the paste will pour or mix readily with the rest of the ingredients. Put into the kettle with the chicken about a quart of rich creamy milk, and when it begins to boil, pour in the butter paste, and stir carefully till it thickens. Have some nice hot biscuits split open and spread upon a platter, and upon these arrange pieces of chicken, over all pour some of the gravy, and take to the table hot, with a dish of nice mashed potatoes.

Sometimes we roll the pieces of chicken in flour (after boiling till tender), and fry in butter, till a nice brown; then make brown gravy, and serve the latter separately; some of the family like this way best. MAY MAPLE.

ROAST DUCKS.

CLEAN and wash very carefully. To a dressing of crumbed bread add, with butter, pepper and salt, a little powdered sage and a minced onion. Stuff and sew up as usual. Baste well while roasting. Skim off the gravy before thickening. Stew the giblets in a little water, when tender, chop and add to the gravy. Accompany with currant jelly.

MRS. B. STORMS.

ROAST GOOSE.

PREPARE for stuffing the same as you would a chicken. Add to fine bread crumbs, two eggs, butter, pepper, salt, a good-sized onion chopped fine, half a tablespoonful of powdered sage and two spoonfuls of minced fat-pork. Stuff very full and sew up. It will take from two to three hours to roast a goose. Cover towards the last with a piece of thick paper which you have greased. Add a little lemon juice to the gravy. MRS. I. D. K.

OMELETS.

IT has always seemed to me that the reason so many cooks fail in making an omelet is that the pan for cooking is not hot enough at the start, and that too much egg is put in at one time. I never attempt to cook more than four eggs at a time. The eggs are beaten light; a small spoonful of salt is added with two tablespoonfuls of milk. Heat the pan you are going to use very hot, put in a spoonful of butter, and when melted, pour in the egg. Shake over the hottest part of the stove until the egg begins to thicken, then let it stand a few minutes to brown. Run a knife between the sides of the omelet and the pan, fold and turn on to a hot dish. You must serve at once. A cheese omelet is made the same as plain omelet with this difference, that as soon as it begins to thicken you sprinkle over the top three or four tablespoonfuls of grated cheese.

ASPARAGUS OMELET.

USE the tender tops only of cooked asparagus, mince and season and stir into the eggs when it is ready to go into the pan.

TOMATO OMELET.

Just before doubling over a plain omelet, spread stewed tomato over the surface, double and serve.

CHICKEN OMELET.

Before folding, spread over the top a cupful of cooked chicken cut rather fine and warmed in a little cream sauce.

JELLY OMELET.

Make the same as for plain omelet, and when the egg has set, spread with currant-jelly. Fold quickly and serve at once. Very nice for dessert. MRS. B. FOSTER.

CREAMED EGGS.

Boil eight or ten eggs hard. Throw into cold water, and carefully take off shells. Put into a deep dish and cover with a drawn butter sauce made of a pint of milk, butter the size of an egg, a small spoonful of corn starch for thickening and a little salt. A very nice tea dish, and one easily prepared for unexpected guests.

DROPPED EGGS.

"How do you manage to have your eggs retain their shape; have you a dish especially for cooking them in this way?" Are the questions often asked of me when eggs are brought upon my table cooked in this way. The secret is in having the water boiling hot when the eggs are dropped in, and then to set the pan on the back of the range where the water cannot boil. I usually grease the bottom of the pan with a little meat drippings before pouring in the water. It is imperative, too, that the pan is not moved until the whites have become set. Salt is added to the water, and bits of butter, more salt and a dash of pepper to the eggs when taken out. A pan-cake turner is best for lifting out of the water. MRS. ECONOMY.

News of the Week.

HOME NEWS.

SATURDAY, May 1, 1886.

STRIKES are even more numerous now than at this time last week, as a large number have just been started for eight hours' work but ten hours' pay. The most extensive of these are in Chicago, where several lines of manufacture have already yielded; but most are resisting. The agitation for shorter hours of labor is pretty general in all the labor centers. Some lines of manufacture cannot allow their expensive machinery to be idle 16 hours out of the 24, as interest on the capital invested in the works would be lost. A majority, perhaps, would allow shorter hours for smaller pay; so the principle of paying by the hour instead of by the day is growing in favor. As predicted here, that strike on the Gould system has virtually collapsed; abundance of new hands can be had; the K of L, will "order off" the boycott and close the strike if the roads will take on all the strikers for whom there is room. The "Citizen's Committee" of St. Louis are negotiating to this end. Gould & Co., boast a great deal; but no doubt the strike still hurts the roads. It will die out quietly most likely.....Here a fortnight's obstinate strike of street car drivers, conductors and stablemen on the Third Avenue line—the largest on the Western Continent—is just collapsing, the strikers' places having been taken by newcomers from as far south as Washington; north as Boston, and west as St. Louis. The men are still obstinate; but will have to seek employment elsewhere for the most part. There's a regular mania for strikes just now; and the general public are getting a good deal tired of them, and the accompanying boycotting. Several of the leaders have been arrested here and in St. Louis, and held for trial; but it will be hard to get a jury to convict them. All expenses will be fully paid by the labor organizations, and the arrested will become "heroes" or "martyrs."....Capitalists everywhere are combining to resist the demands of labor. Cotton and woolen mills in New England, representing $50,000,000, have formed such a union; so have brass manufacturers hereabouts representing $10,000,000; so have various other lines of manufacterers in the West, notably furniture makers.....Mr. Brooks, of Phelps, N. Y., has just discovered a new comet in Cassiopeia..... At last the New Orleans Exposition is in the hands of a receiver—bankrupt.....The total interest bearing-debt of the United States, according to the last official statement on the 31st of March, 1886, was $1,240,681,462, including the $64,623,512 of the bonds issued in aid of the Pacific railroads. These roads are now urging Congress to allow them 70 years more to clear off principal and interest, at the rate of $4,000,000 a year.....Mail bags from the sunken Oregon are being still picked up; one containing printed matter, and another 4,500 letters were received at the Post Office here Thursday. Hitherto 275 bags have been received out of 598 dispatched..... ..The original Eads' ship railway scheme called for a total U. S., guarantee of $37,500,000; a new bill calls for $7,500,000. The guarantee is too hold good for five instead of 15 years. Several other amendments are made in the way of lighter charges on American vessels than on those of other countries.....The President and the new Chinese Minister, Cheng Yen Hoon, made very civil speeches to each other Thursday. There is considerable fear that the Celestials at home will take vengeance on resident Americans for the injuries their countrymen have suffered here. There is no mob more cruel and blood-thirsty than a Chinese..... .Wednesday, Jefferson Davis, from the steps of the State Capitol, Montgomery, Alabama, the exact spot on which he received the acclamations of the people on his inauguration as President of the Confederacy in 1861, floridly landed, as usual, the "Lost Cause," and its justice, while bewailing its fate. Audience enthusiastic and sympathetic. Stars and Bars floating gaily—yes, and Stars and Stripes, too.....Friday he was received at Atlanta "with the wildest enthusiasm, the whole population turning out to honor the Confederate Chief."....Considerable enthusiasm for the late "unpleasantness" reported in many parts of the South. Some enthusiastic singing of "We'll hang Jeff. Davis" etc., in several places in the North..... .....Floods reported at several points along the Lower Mississippi—the worst just now at Helena, Arkansas. Mississippi State hitherto the worst sufferer. River expected to continue rising for two or three days more. As the rise goes south, more leaks in the levees expected. Two negroes hung near Helena, Thursday, for cutting the levee.....The transcontinental railroads have been so overcrowded with freight and passenger business of late, owing to the severe cutting of rates, that they have not had facilities for doing all the business offered, even after they had hauled out old cars and used cattle cars for passengers in some cases. Over 75,000 have visited California, a large number of them for permanent settlement. The roads—most of them—have put up rates to half the old-time charges; but as "scalpers" invested heavily in tickets at bottom rates, people can still go from the Mississippi to the Pacific for from $50 down to $10, according to their cuteness in getting tickets.....Last Winter Virginia passed a "local option" law. A large State Convention has been held at Lynchburg; a number of towns and cities have already voted on the question, the larger places generally for license, the smaller places against it. Monday Richmond gave 5,681 majority out of a combined vote of 12,201 for the "wet" ticket. Liquor prohibition promises as lively a time as debt readjustment for some months in the Old Dominion.....Prohibition is observed more or less stringently in 115 out of the 137 counties in Ga.....Senator Payne, of Ohio, says all the bribery talk is "baseless gossip and scandal." "Unproved" is suggested for "baseless."....The general impression is that there will be no tariff bill passed at this session of Congress. If passed by the House, the Senate would kill or pigeon-hole it.....Of 2,156 nominations sent in by the President, the Senate has hitherto rejected only eight.....Some say Congress will adjourn in August; others, in the middle of July. What has it hitherto done except gabble, chiefly "to make political capital" for one party or the other?.....Lovesick Jones, of Florida, will return to Washington if the other Senators won't tease him..... ....Of 180 Mormon recruits that arrived here from Europe Tuesday, about 50 were children; 200 more will arrive in a few weeks..... Receipts of the Government for the first nine months of the present fiscal year (ends June 30) were $7,000,000 more, and its outlay $16,000,000 less than for the corresponding period last year.....The Carrollton (Miss.) Grand Jury has failed to bring in a single indictment for the murder of those 15 "niggers" in the court-house; but it examined 165 witnesses.... Ferhydric gas, "the best illuminating gas known," "invented" by Col. McCarthy, it is said, can be sold for three cents a 1,000 feet—we are paying $1.75 for coal gas. This hydrogen gas is over 2½ times hotter than coal gas. If claims are true, it must soon come into general use.....Sec. Manning is well enough to drive out.....Ex-President Arthur is again reported to be a very sick man in spite of all denials.....Geronimo and those of his band who escaped with him from Lieut. Maus, the other day, have begun another series of horrible murders and atrocities in Arizona. Gen. Miles is now after them, Gen. Crook's headquarters having been transferred to Omaha, Neb.....Several of those injured by that Minnesota cyclone have since died. Sauk Rapids has been "wiped out."..... Congress is asked to give $2 a day for the period of his confinement to each union soldier put in a Confederate prison at any time during the war. About 25,000 such ex-pensioner are supposed to be living. The Committee on Invalid Pensions think $4,000,000 would be required; others say $10,000,000.....Another project is to pension for life everybody captured and confined in a Southern prison.....

AGRICULTURAL NEWS.

SATURDAY, May 1, 1886.

REPRESENTATIVE W. H. Hatch, of Mo., Chairman of the Committee on Agriculture, last Wednesday, introduced into the House the Committee's oleomargarine bill.....The Minnesota Knights of Labor have purchased 600 acres in Crow Wing Co., and will establish thereon a co-operative colony. The land is to be held in common forever; but the profits are to be divided yearly among the workers..... ....For the five months ending March 31, exports of beef, pork and dairy products aggregated $31,661,164, against $41,186,331 in the same time a year before.....England exported only 35 pure-bred Short-horns in the last quarter of 1885, 15 animals going to the Argentine Confederation, 10 to Denmark, seven to France and one to Russia.....A Total of 1,740 Short-horn cattle were sold at public auction in England last year, at an average of $172.68. In 1884 the average was $227.12 for 1,666 head. The year 1883 was between the two, and 1882 and 1881 were below 1885.....The imports of live stock and dressed meats from American and Canadian ports at Liverpool in January, February and March, 1885, amounted to 20,810 cattle, 2,055 sheep, 121,370 quarters of beef, 16,535 carcasses of mutton and 880 hogs. This year the totals were 11,518 cattle, 2,147 sheep, 101,612 quarters of beef, 6,403 carcasses of mutton and four hogs.....About 60,000,000 pounds of imitation butter were sold in this country last year.....The shipment of American apples abroad for the season, now concluded, aggregates 805,848 barrels..... .....Of the wheat imported by Germany last year, Russia furnished 56 per cent., Holland, 11 per cent', Austro-Hungary, 8 per cent., Belgium, 7 per cent., and the United States, 5 per cent.....Last year this country imported 509,447 bushels potatoes from Canada, 99,264 from Scotland, and 33,834 bushels from Bermuda. We exported 173,344 bushels to Cuba, 36,337 to Sandwich Islands, 43,492 to Canada, and 119,295 to other foreign ports. Imports, 642,545 bushels; exports, 302,468 bushels.....The farms of America comprise 837,628 square miles, an area nearly equal to one-fourth of Europe, and larger than the four greatest European countries put together (Russia excepted)—namely France, Germany, Austria and Hungary and Spain..... ....The Agricultural Society of France, with 5,000 members, will establish a French draft-horse stud book to "secure a disinterested and reliable registration" of the "Race Francaise de Trait"—French draft-horse race. It will admit Percherons, Normans, Bonlonnais and Breton and other local kinds, not as distinct breeds but merely as strains of the grand race of Francaise de Trait. Proof of purity of blood essential.....Arbor Day was widely celebrated in Massachusetts last Saturday, and is being celebrated in Ohio today.....The celebrated trotter Gen. Butler is dead at the age of 30.....The butchers of the country in convention assembled during the coming week at St. Louis, will talk of monopolies by dressed meat shippers, and of Western cattle kings. They will be especially bitter against the Chicago shippers, and will advocate Eastern butchers' boycotting of Western dressed beef.....For the year ending March 1, the Armour Packing Co., at Kansas City, slaughtered 62,575 cattle, and three other firms a total of 25,260, making an aggregate of 87,835, against 80,292 for 1884-5, and 58,856 for 1883-4....."Butterine" imports into the United Kingdom for the first three months of 1886 were 29,587,904 pounds, while the quantity of butter imported was 42,605,920 pounds. Not unlikely some "butterine" stole in as butter..... The sudden arrival of warm weather has been disastrous to the maple sugar crop of Wisconsin.

Crops & Markets.

SATURDAY, May 1, 1886

THE London wool sale closed April 21. The total amount offered during its progress, was 276,000 bales. Of these 112,000 bales were bought for Great Britain, 116,000 for the Continent and 2,000 for America. The remainder, 46,000 bales, will be offered at the next series. A comparison with the prices prevailing at the previous series shows the Australian and New Zealand, greasy, averaged 1½ cent and two cents lower than the previous series; do. fleece and scoured, two and three cents lower; and do. snow whites, two cents lower.

In Richmond, Va., the tobacco trade is dull. There is a disposition to keep leaf home for a better demand; storage and insurance very low, $1.25 per hogshead for four months; extra storage and insurance range three-fourths to one-and-three-fourths per cent. New bright West Virginia tobacco offering freely at low figures. Little interest in Kentucky and Western tobacco. A rebate of 90 to 100 per cent. on all imported ingredients entering into the manufacture of tobacco is sought whenever the tobacco is exported.

We give below the comparative wholesale prices in this market for various products during the past year. These prices are those given for the first of each month. The highest prices are quoted for butter, with a fair average price for the others. The pork and poultry were dressed, the beef alive. The articles are all quoted by the pound, except the eggs.

	Eggs.	Poultry.	Butter.	Pork.	Beef.
January....	27	12	30	4½	4.35
February...	22½	10	35	5¼	5¼
March.....	22½	12	34	5¾	5
April.....	12¼	12	35	6	5½
May.....	13	12½	29	5¾	5½
June.....	14	13	19	6	5½
July.....	13	12	20	5⅛	5
August.....	14	12	19	6	5
September..	16	13	23	6½	5½
October.....	21	12	23	5½	5
November..	28	14	29	5½	5
December..	23	14	28	5¼	4¾

Many tons of poultry were sold at 35 to 90 cents per pound to special customers, and many hundred dozens of eggs were sold at from 40 to 75 cents per dozen the year round. These fancy markets are generally secured by personal solicitation or through city friends, and are maintained only by constant care and attention. White Leghorn eggs sell for best prices in this market, though there is less distinction made here than there is in Boston. The great proportion of eggs come from the West and Canada. Fresh "near-by" eggs are generally sold to private customers. Eggs are packed in patent egg cases, or in barrels partly filled with cut straw. The most profitable season for egg production is from October to March. Live fowls find extensive sale among the lower classes. They are shipped in coops and boxes; the wire netting coop gives best satisfaction. Probably the Plymouth Rocks sell best alive. Their clean, neat color attracts attention at once. Most of the live poultry sent into this market are of no regular breed—common farm yard fowls. Dead fowls must be drawn. It is against the law to offer undrawn poultry here. Jersey State and Pennsylvania fowls command from two cents to three cents more per pound than Western stock. This is mostly due to the fact that the first-named stock appears in better condition, and presents a cleaner and neater appearance. The appearance of poultry has much to do with its sale. Rough, torn and discolored lots always find poor sale. The best selling poultry comes packed in boxes, breast down, with long straw or clean cloths between the layers of birds. As a rule, small shipments of poultry, live or dressed, will hardly pay unless one has special customers. It will probably be cheaper to sell small lots to the local dealers where cash prices can be obtained. In shipping poultry or eggs for the first time, write to any good commission merchant, or, better still, go and see him, and make a distinct bargain before sending; care and cleanliness will always be rewarded if persevered in. No distinction is made in the general market between thoroughbred and common fowls, except that a plump, yellow carcass will always command the best price.

"I have been afflicted with an Affection of the Throat from childhood, caused by diphtheria, and have used various remedies, but have never found anything equal to BROWN'S BRONCHIAL TROCHES.—*Rev. G. M. P. Hampton, Piketon, Ky.* Sold only in boxes.—*Adv.*

MARKETS BY TELEGRAPH.

SATURDAY, May 1, 1886.

PRODUCE COMMISSION HOUSE
ESTABLISHED 1865.
S. H. & E. H. FROST,
100 PARK PLACE, N. Y.
Shippers desiring to favor us will be furnished stencils, shipping cards, etc., on application. Promptness guaranteed. References, RURAL NEW-YORKER, Irving National Bank, etc.

THERMOSTATIC INCUBATOR.
Send for circular. **E. S. Renwick,**
19 PARK PLACE, NEW YORK.

3,000,000 SWEET POTATO Plants.—Early Golden, and all leading kinds. By mail, $1 per per 200; by express, $1 per 500; $1.75 per 1,000. Nansemond, $1.25 per 1,000. Write for circular. **W. W. Ruthbone,** MARIETTA, O.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

Walling-ford's Garget Cure
J. C. CHUTE, Windham, Me., had a cow whose bag was badly swollen. She gave milk from two teats only. He used *Wallingford's Garget Cure*, and two doses cured her. She has had no trouble since. Mr. Chute will endorse it as a good thing.
Send for circular.
W. W. WHIPPLE & CO., Prop'rs, Portland, Maine.
McKESSON & ROBBINS, N. Y. Agents.

C. P. JORDAN,
12 years a breeder of *Standard White Leghorns*. I have won hundreds of first and special premiums. No strain of this variety have won more first premiums for the number of times exhibited. Only two exhibits this season. At Meriden, Conn., every first second and special offered. At Stofford Springs, every first premium. At both shows had strong competition.
PEKIN BANTAM. I have three Breeding Pens, 6 birds in each; they are beauties; no breeder in America owns a better lot; all out of imported stock.
Send for circular. **C. P. JORDAN,**
P. O. BOX 1094. NEW HAVEN, CONN.

LANGSHANS.
EXCLUSIVELY.
Champions at Winsted, Conn., 1885; at Meriden, Conn., 1885-6; also at the Great International Show in New York City, 1886.
My stock is pronounced by the most competent judges **The Champions of America.**
Eggs, $1 per 13; $7 per 26; $9 per 39. Packed in baskets to carry any distance. Send for circular—free to all. Address, with stamp,
ROBERT SEAMAN, Jericho, N. Y.

MERIDEN POULTRY ASSOCIATION.
Its membership in Connecticut and neighboring States includes breeders of nearly every variety of pure bred poultry.
Send for By Laws. Roll of Members and Breeders' Directory free.
THE TENTH ANNUAL SHOW
WILL BE HELD
THE LAST WEEK IN DECEMBER.
Address **J. SHUTE,** MERIDEN, CONN.

Silver Queen Strain WYANDOTTES. Seven prizes in January, 1886 in Wooster Show.
Eggs, $3 for 13; $5 for 26; $7 for 39.
DR. A. A. HOWLAND, WORCESTER, MASS.

LIGHT BRAHMAS.
Several Breeding Pens of Light Brahmas for sale cheap. Send for 13th Annual Catalogue.
RIVERSIDE FARM, EAST BALDWIN, ME.

Mottled Javas, Brown Leghorns.
Pure Blood. None better. Eggs, $2 for 13; $3.50 for 26.
OLIVAR S. DUPAR, LEE, MASS.

ESTABLISHED POULTRY YARDS
In successful operation near New York, will sell half interest. Address "BROILERS."
Care of **L. N. CLARK & SON,** 38 DEY ST, N. Y.

PECK & RIGGS.
PRICE OF EGGS REDUCED. Will sell for the balance of the season from Prize Winning P. Rocks. $2 for 13. Address 345 ELM ST., NEW HAVEN, CONN.

HOW TO MAKE COMMON POULTRY PAY!
Seven years' experience of a MARKET POULTERER, on THE JOHNS HOPKINS UNIVERSITY FARM. Enclose ten cents to **CHAS. C. BUCK & CO.,** Cor. Howard and Franklin Sts., BALTIMORE, MD.

Send us your orders for EGGS from Langshans, Wyandottes, Houdans, Rose Comb, W. and B. Leghorns, also for Italian Bees and Queens, and Poland China Pigs. Stock all No. 1, and strictly pure bred. Safe arrival and satisfaction guaranteed. Instructive Circular free. Mention the Rural.
J. C. BOWMAN & CO., NORTH LIMA, OHIO.

POULTRY SUPPLIES.
Fresh Ground Beef Scraps, Granulated Bone, Crushed O. Shells. Also PURE GROUND BONE for Fertilizer; it is a special for Grapes and Small Fruits.
Send for Circulars and Samples.
Rendering works and mills at Worcester, Mass.
C. A. BARTLETT.

WILLIAM WOODLEY,
Breeder of Thoroughbred Light Brahmas. First prize awarded on Breeding Pens at Meriden, in 1883, 4, and 5. Second on Cockerel and Pullet, and Special for the highest scoring pair owned in Meriden. Eggs, $3 for 13; $5 for 26. Stock for sale in September.
Address **18 Crescent St., Meriden, Conn.**

BROWN LEGHORNS.
This variety has been bred by me for over ten years with great care.
Eggs from May 1st at $2 per dozen.
Also Collie Dogs for sale.
Mention this paper.

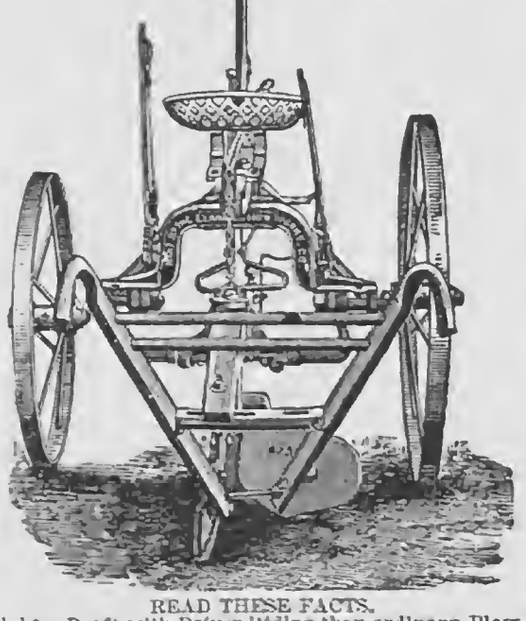
Our 50 egg machine, only $20, is giving unqualified satisfaction.

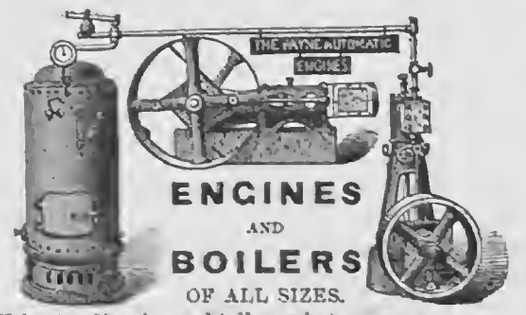
To the Kainit Trade.
ROBERT S. CARR,
Admiralit Ætstrasse 52.
TELEGRAMM-ADDRESSE.....ROBERT CARR.
HAMBURG, 1st of January, 1886.
The undersigned has the honor to inform all those interested in the KAINIT TRADE that he has been appointed by the STASSFURT SYNDICATE OF KAINIT WORKS, consisting of KÖNIGLICH PREUSSISCHES SALZWERK, STASSFURT, (The Royal Prussian Saltmine); HERZOGL. ANHALT. SALZWERK, LEOPOLDSHALL, (The Ducal Anhalt Saltmine); SALZBERGWERK NEU-STASSFURT, LOEDERBURG, (The Saltmine New Stassfurt); KALIWERKE ASCHERSLEBEN, GEWERKSCHAFT, ASCHERSLEBEN, (The Kaliworks Aschersleben), as their SOLE AGENT for the sale of this article to the United States of North America and Canada. As such, any orders will be carefully and promptly executed at the shortest notice and lowest possible current cost.
The demand for Kainit is steadily increasing, and the agricultural public, in becoming more acquainted therewith, is rapidly realizing the fact that the small cost of the article (it is the cheapest article for agricultural purposes) compares favorably with the results arrived at. As a standard Kainit is guaranteed to contain no less than 23 per cent. Sulphate of Potash and assuring all importers of the greatest care in executing orders entrusted to the undersigned, he is always ready to quote by cable or letter in reply to inquiries made direct or through his agents. Representatives for Baltimore; Messrs. PRIOR & VON COLLEN, 25 S. Gay Street, Baltimore. **ROBERT S. CARR.**

THE WILLIAMS

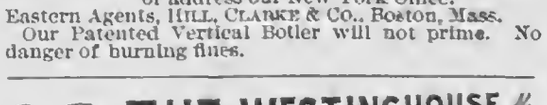
Grain Threshers, Horse Powers, and Engines.
Highest prize awarded these machines at the New York State Ag. Soc.'s latest trial, over a large number competing. Ample warranty and opportunity for trial given. For full particulars address
ST. JOHNSVILLE AGR'L WORKS,
St. Johnsville, Montgomery Co., New York.

THE ELKHART PLOW SULKY


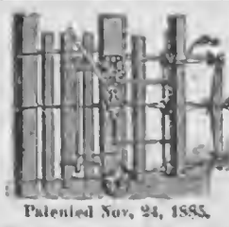
READ THESE FACTS.
Lighter Draft with Driver Riding than ordinary Plow with Driver Walking. Turns square corner without backing. It is wholly constructed of iron except tongue and front lever.
We claim and GUARANTEE that a Plow attached to the Sulky and carrying the driver, is from five to 100 pounds lighter draft than the same Plow doing same work without the Sulky. Write for prices.
ELKHART IRON WORKS,
ELKHART, IND.
Mention Rural New-Yorker.



ENGINES AND BOILERS OF ALL SIZES.
Write for Circular and tell us what you want.
B. W. PAYNE & SON, Drawer 106, ELMIRA, N. Y.
or address our New York Office.
Eastern Agents, HILL, CLARKE & Co., Boston, Mass.
Our Patented Vertical Boiler will not prime. No danger of burning flues.



Grain Threshers, unequaled in capacity for separating and cleaning.
Combined Grain and Clover Threshers, fully equal to regular grain machines on grain, and a genuine **Clover Huller** in addition.
Two Speed Traction & Plain Engines. 4 to 15 Horse Power, positively the most desirable for Lightness, Economy, Power and Safety. Boiler has horizontal tubes, and is therefore free from the objectionable features of vertical boilers.
Horse Powers, both Lever and Endless Chain. All sizes. Send for Catalogue. Address,
THE WESTINGHOUSE CO.,
Schenectady, N. Y.



Patented Nov. 24, 1885.
RICHMOND CHAMPION FENCE MACHINE
Surpasses all other wire and picket fence machines, for making strong and durable fences in the field, that no stock will break down. On rough, hilly ground, it keeps pickets perpendicular which no other machine will do without constant adjustment. It is easy to handle, uses any kind of pickets, and any size of wire. Write for circular and price.
WAYNE AGRICULTURAL CO., Richmond, Ind.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.
It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.
AS AN EVIDENCE OF FAITH
in my remedy I make the following offer:
1. I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.
2. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.
3. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.
Facts are Better than Assertions.
Please read the following testimony:
GIBSONTON P. O., PA., Feb. 2, 1885.
Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*
Yours very truly. WHITE & CO.
[N. B.—White & Co., since writing the above letter, have purchased $450 worth of the remedy.]
The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

For the Young.

NEVER STOP TO CROW!

I saw a Bantam rooster
  Strutting foolishly around;
He was just the valuest fellow
  That could possibly be found.
With his feathers all a-ruffle
  And his head held high in air,
He was just a feathered handful
  Of importance, I declare.
As he strutted through the garden
  With a step both high and firm,
On the mellow soil below him
  Lay a fat and toothsome worm.
All the other mighty roosters
  Had been hunting all in vain
For the prize which little Banty
  Felt himself about to gain.
But the foolish little fellow
  Thought that he must stop and crow,
Just to celebrate his smartness,
  That the other folks might know.
So he threw his small head backwards
  And he opened wide his beak,
And to him the sound was mighty,
  Though to me it seemed a squeak.
While the little chap was crowing
  All his foolish breath away,
Came a wise old hen and gobbled
  Up the fat worm where it lay,
So that when he stopped his crowing
  There was nothing to be found;
He had won a barren triumph,
  He had lost it all in sound.
Now remember, when Dame Fortune
  Puts her chances in your way,
Never stop to brag about it
  While you let them idly stay.
Be not like the foolish Bantam,
  Work with patience long and well
Then no need to crow your triumph,
  For the years themselves will tell.

—UNCLE MARK.

BROWN LEGHORNS.

The champion layers of the world. These are the birds of my choice on account of their beauty and their value as layers. When I began I bought the best stock I could find, and having taken great care in breeding, I think I can now say that my Brown Leghorns are as fine as any in the State of Connecticut. The first importation of Brown Leghorns into this country, of which we have any record, was about 50 years ago. They were called Red Leghorns and had combs and wattles larger than any seen before in this country. The pullets would commence laying when about four months old, and their reputation for prolificness became established beyond a cavil. This reputation has been kept up so that at present no one pretends to have fowls that will excel Brown Leghorns in the production of eggs. They are small, lively, erect of carriage, have large wings, are good foragers, small eaters, and turn what they eat to good account. They require a warm house in Winter on account of their large combs, but in my warm house, many a day in the past Winter I have brought in 15 or 16 eggs from a flock of 18 hens. Brown Leghorns have been improved, and it is easier to-day to find standard birds of this breed in the United States than in Italy.

Hartford, Conn. HOWARD A. GIDDINGS.

[Leghorns are the birds for eggs undoubtedly. It is not so much the bird, though, as it is the care that produces the eggs.—U. M.]

MONEY IN POULTRY.

I raise ducks only for fancy—Rouens and Dark Muscovas. I raised about 50 last year. The eggs hatched well in the incubator. I raised them in a brooder without any heat. Gave them soft feed, corn meal, stale crackers soaked in milk, and did not lose but one by weakness. They had good clean water three or four times a day. I do not think that a pond is absolutely necessary, but they want a place to wash when they begin to get feathers. I want to tell you something about my chicken house and the profits. I will give you facts without dollars and cents. Any one can make that out for themselves. I started Nov. 1, 1884 to build a house. I had 56 very good Plymouth Rocks and $20 in the bank. December 20 I had my house 24x26 feet ready for the chickens. Now for what I have done. I have increased my stock to 180 hens, with two fine breeding pens of Plymouth Rocks from the best in the country, and one very fine pen of S. C. B. Leghorns. I have paid for most of the feed I used. Paid $65 for incubators, fixed my house all over and now it is 24x58 feet, and I am now in debt about $20, with an income of 90 eggs a day. I ship 21 dozen per week to customers in New York City, for which I get 36 cents per dozen. I raised about 500 chickens last year. I used brooders that I made myself. They cost me 94 cents, besides the lumber and labor, which is very small.

Coxsackie, N. Y. JAY B LAMPMAN.

[Well done! That is good business. Who says chickens will not pay now? Won't you send us a description of your brooder?—U. M.]

LETTERS FROM THE COUSINS.

Dear Uncle Mark: I am not a little girl, but a little old woman, 61 years old. I want to tell the Cousins how I feed my chickens. Last Summer I raised 50 chickens, nine bantams and eight ducks. I never had a single sick one. A mink killed eight in one day, but the men soon killed the mink. I mix all the dough with milk, and put a very little salt, black and red pepper and soda in it. Chickens want plenty of good water in hot weather. In cold weather I take the corn in the house and heat it in the oven. We give water warm in cold weather too. We get our oats and corn ground together for the cows, so I mix some of that once or twice a week and put in it a pinch each of pepper, salt and soda. Our hens have been very healthy and have laid a great many eggs. Some of the hens got to eating their eggs. I took an egg-shell and filled it with dough very strong with red pepper. Since the hens started to eat that I have had no more trouble with them. AN OLD FRIEND.

Dear Uncle Mark: We have 10 Plymouth Rocks; eight of them are hens. We got them January 22d. One commenced laying January 28th, and laid 24 eggs before she quit, and she has commenced to lay again. They have altogether laid about 150 eggs. We have 37 Plymouth Rock chicks hatched; some of them two weeks old. Two of the hens wanted to sit; one was easily induced to lay again, but the other we could not stop from sitting. We would take her out and put her on the ground, but she would sit the same. At last we made her a nice nest and gave her 17 eggs. She is sitting well. We children love to hunt the eggs. We cultivated a plant last year and the year before last that we thought was one of the Garden Treasures. It made a large plant with large coarse leaves, square stem, and had a great many small greenish-brown flowers, and had a drop of honey in each flower. In the Fall it had a great many little green seed pods. We now think it is Figwort. The bees worked on it constantly. All of the members here have received their Sweet Peas but myself, but we have enough and I will help cultivate the Garden Treasures. Your niece,

Abingdon, Va. GRACE B. KELLY.

[I am glad the girls like poultry raising. I have always thought they could care for fowls as well as the boys, if not better.—U. M.]

Dear Uncle Mark: I am a little girl seven years old; and would like to join the Y. H. C. I have two sisters, Mary and Anna. Mary is 12 years old and Anna not quite three. We live on a large farm in Birmingham, Chester Co., Pa., three miles from West Chester. We keep a great many cows and hogs. We have six horses, two of them are carriage horses. We have chickens, turkeys and guineas. We live on "Historic Ground." The battle of Brandywine was fought near here, and the British marched right by this place. Birmingham Meeting House, where the wounded were taken, is only a mile away, and some of the soldiers are buried in the graveyard. We go to meeting close to it. Some of the hardest fighting was in what is now my Papa's woods, and some years ago, when they sawed into a tree, they found one of the bullets. My Papa was born here where we live, and my grandfather owned the farm, and great-grand-father too. We are going to have some flower beds this summer. We have a truck patch, and will have strawberries, raspberries, grapes and vegetables. We have a chestnut tree my Papa planted 40 years ago, when he was a little boy; and last year we sold $25 worth of chestnuts off it. We have other trees, but keep the nuts at home. Papa had a play-house built for us, it is beautiful yellow pine, and is a real house, we play "keep house" in it. It has two windows. I cannot read. Mamma does not care for us to learn too young. My sister Mary reads to me sometimes. So do Mama and Aunty. I like to have the letters in the Rural read to me. I am going to help feed chickens and hunt eggs this summer, for I am to be out as much as possible, as I am not strong. If you will have me for a member of the club, I will write again next Fall, and tell you how we make out with our flowers, chestnuts, chickens and turkeys.

MAGGIE SHARPLESS.

Birmingham, Chester Co., Pa.

[We are glad you wrote, Maggie. We are glad enough that there are no battles to be fought on your Papa's farm now. We hope you will get strong and well again this Summer. I am glad you are not in a hurry to learn how to read. There will be plenty of time for that.

Maggie's Papa writes that the chestnut tree is a Spanish seedling, nuts, medium sized and very early.—U. M.]

Letters Received from S. P. Shull; Ursa Major James H. Fregemba; Lou Hall; Effie Smith; Maude F. Wright; Eula Cox; Jimmie B. Bokaw; Arthur Smith.

Miscellaneous Advertising.

ANOTHER HOUSEHOLD NECESSITY.

Mr. Wild, the Inventor of Linoleum, notes a Discovery as Valuable as his Own.

Fifteen or twenty years ago it was found that a floor-covering could be made, looking like oil-cloth and lasting as long if not longer, and yet without that coldness to the tread which is one of the peculiar characteristics of oil-cloth. The new article was made of very finely ground particles of cork, mixed with linsed oil and other substances in mysterious ways which need not here and now be described. "Linoleum" was the name selected for it. At first it was put before the public on a very small scale. But its merits created a great demand for it, and is now a household institution, both in this country and in England. At the head of the Linoleum business, in this country, is the well-known house of Joseph Wild & Co., of 84 Worth St., New York.

The senior partner of this firm is Joseph Wild, Esq., a resident of South Brooklyn, and one of the most hearty looking gentlemen of his age anywhere to be seen. He is considerably over seventy, with snow-white hair, erect form, and a very cheerful countenance. To look at him one would suppose he never had suffered a day's illness in his life. Yet there was a time when Mr. Wild was an invalid, worn by active attention to business, and seeming to be on the verge of total nervous prostration. Concerning his invalidity and his restoration to health one of our correspondents recently had little conversation with him at his store.

"They tell me you were considerably run down in health, Mr. Wild!"

"It is very true, sir. I was not bed-ridden, nor was I entirely laid aside from business, but I had given myself very closely to my business affairs, and my duties in connection with the church and some of the Baptist benevolent societies had weighed upon me. A younger man than I might not have felt these burdens as I did, but at my time of life they began to make their mark on my constitution. I felt a lack of vitality and realized that my nerve power was about to fail me. My appetite was not as it formerly had been and my digestion was somewhat disordered. I needed in fact, revitalization. About this time I heard of Compound Oxygen, and I made inquiry of Dr. Turner, in charge of the New York office of this remedy, to see if it could be applicable to me. Learning from him that others who had been run as down I was had been benefited by the the Compound Oxygen. I procured a 'Home Treatment' with considerable doubt as to whether or not it would do me any good. This was about two years ago. Since that time I have been taking Compound Oxygen, not all the time, but frequently at intervals, when I have felt the need of it."

"Then you received decided benefit from it at the outset?"

"Very soon after I began to inhale I found that I was receiving new strength. And I was glad to note that it was real strength and not a mere stimulus. I noted also the steadiness of my improvement. There was no falling back but a constant and reliable advance. Daily I could feel an increase of vitality. My spirits were better and my power of action was greater. I was able to attend to my business and to all my other duties with far less strain on me than I had for some time previously experienced."

"And so you now find yourself as well as ever, and beyond the necessity of medicine?"

"For a man of my years I am as hearty and vigorous as I can expect. I am free from disease and pain and am attending to as much detail of business as if I were only fifty years old. As to medicine, I have no use for it, drug-medicine I mean. I do not call this Oxygen exactly a medicine; certainly not in the sense that drugs are medicinal. I regard it as a wonderful vitalizer and invigorator. And it as such that I even now occasionly resort to it when I feel the need. I keep it in the house and intend to continue doing so."

To the many gentlemen of advancing years who are over-worked and weary, and who feel themselves in need of revitalization, Compound Oxygen is, as in Mr. Wild's case, a valuable helper. The late T. S. Arthur, of Philadelphia, was brought almost from the grave by this means when he was quite an old man, and by it his life was prolonged for a number of years. The Hon. William D. Kelley, of Philadelphia, who is beyond seventy, attributes to Compound Oxygen, his recovery from from what had been pronounced a fatal disease. He still uses the Oxygen as a vitalizer and is in vigorous condition, attending to his legal and congressional duties as actively as of old.

For a valuable treatise on what Compound Oxygen is and what it does, write to Drs. Starkey & Palen, 1529 Arch Street, Philadelphia. The treatise will be mailed free of charge,

Because uric acid in the blood causes most human ailments is why Warner's safe cure restores to health so many people suffering from so many apparently different diseases. It neutralizes and removes the uric acid.

I START MEN
OF SMALL MEANS in the New lucrative business of "HOME PHOTOGRAPHY."
By the recent great discovery of substituting a Dry Gelatine film for Wet Collodion, the entire material is now prepared in large Photo. Factories, and sold READY FOR USE, similar to Cartridges for a Gun; Enabling Men or Women with **no experience,** to produce superior Photos to what formerly required long years of difficult practice; costing less than **50 cts.** for one dozen large photos, that sell for **$4** to **$6.** Is paying big with **other business** in *stores* or *shops,* or at **home,** or from *house to house.* The novel surprise of a man with complete apparatus, appearing at the door ready to photo. anything, Persons, Groups, Buildings, or Animals, secures profitable orders in nine out of ten homes; Affords **Steady Work** and pays **300 per cent.** profit.
To EARNEST applicants (one only) of *Process Illustrated,* Free, Sample Photos. **10** cents. FRANKLIN PUTNAM, M'f'r & Dealer in Photo. Apparatus, **483, 485** Canal St. N.Y.

PILES. Instant relief. Final cure in 10 days, and never returns. No purge, no salve, no suppository. Sufferers will learn of a simple remedy, free, by addressing C. J. MASON, 78 Nassau Street, N. Y.

Brewster's Patent Rein Holder.
Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.
E. E. BREWSTER, Holly, Mich.

GOLD MEDAL, PARIS, 1878.
BAKER'S
Breakfast Cocoa.
Warranted *absolutely pure Cocoa,* from which the excess of Oil has been removed. It has *three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup.* It is delicious, nourishing, strengthening, easily digested, and admirably adapted for invalids as well as for persons in health.
Sold by Grocers everywhere.
W. BAKER & CO., Dorchester, Mass.

TELEPHONES SOLD.
Don't pay exorbitant rental fees to the Bell Telephone Monopoly to use their Telephones on lines less than two miles in length. A few months' rental buys a first-class Telephone that is no infringement, and works splendid on lines for private use on any kind of wire, and works good in stormy weather. It makes home pleasant; annihilates time; prevents burglaries; saves many steps, and is just what every business man and farmer should have to connect stores, houses, depots, factories, colleges, etc., etc. The only practicable and reliable Telephone that is sold outright and warranted to work.
Chance for agents. No previous experience required. Circulars free. WM. L. NORTON, Buffalo, N. Y

PERSONALS.

SAMUEL J. TILDEN is reported to have made $1,250,000 out of a Lake Superior iron mine. It is thought that this isn't much over one-tenth of the old man's "bar'l."

THE stalwart form of Roscoe Conkling is getting to be a familiar figure in the streets and public places here. He has grown quite stout and lost somewhat of his old-time grace of movement. His hair is quite gray and his short beard snow-white.

SENATOR DOLPH, of Oregon, is regarded by the ladies as the handsomest man in the Senate. He is tall and broad-shouldered, speaks with a rich, deep, bass voice, and has a magnificent full beard, which falls to the middle of his waistcoat. He has a striking face and majestic bearing, both of which attract attention.

CHARLES A. DANA is 66 years old, but looks fully 10 years younger. He goes to the Sun office at 11 in the morning and leaves at four in the afternoon. All his editorials are dictated to a stenographer. When dictating he allows no one to interrupt him, though usually accessible to all persons, thus preserving his line of thought unbroken. His office is plainly furnished, the walls being covered with photographs of dead friends. His health is almost perfect.

Miscellaneous Advertising.

7,000 CHALLENGE WIND MILLS.

IN USE IN EVERY State and Territory of the U. S. It is a sectional wheel, has been made by us 15 years, and has never blown down without tower breaking, a record no other mill can show. Save labor and money; are simple, durable, cost but little. No trouble to get over high beams or to the end of deep bays. Thousands now in use. Wood Pulleys, Floor Hooks, etc. Send for circular and designs for trackling barns, to

U. S. Wind Engine & Pump Co., Batavia, Kane Co., Ill.

ECLIPSE

POST HOLE DIGGER.

The Greatest LABOR-SAVING tool ever invented for digging holes in the ground. This machine works on a new principle, and is unlike anything in the market. It is neither an Auger nor a Plunger, but is driven in the ground with a driving rod, which works in a pipe similar to a telescope. We claim for this tool:

1st. That one man can dig from two to three hundred holes two feet in ordinary ground in one day.

2nd. That it will dig holes any size or depth required.

3d. That it will work successfully in very hard or rough ground where other diggers and augers will not work at all.

4th. You stand up straight while using it, consequently no back-breaking work is required.

It will pay you to send for descriptive circulars and prices to COLE & FLEMING, Manufacturers, Springfield, O.

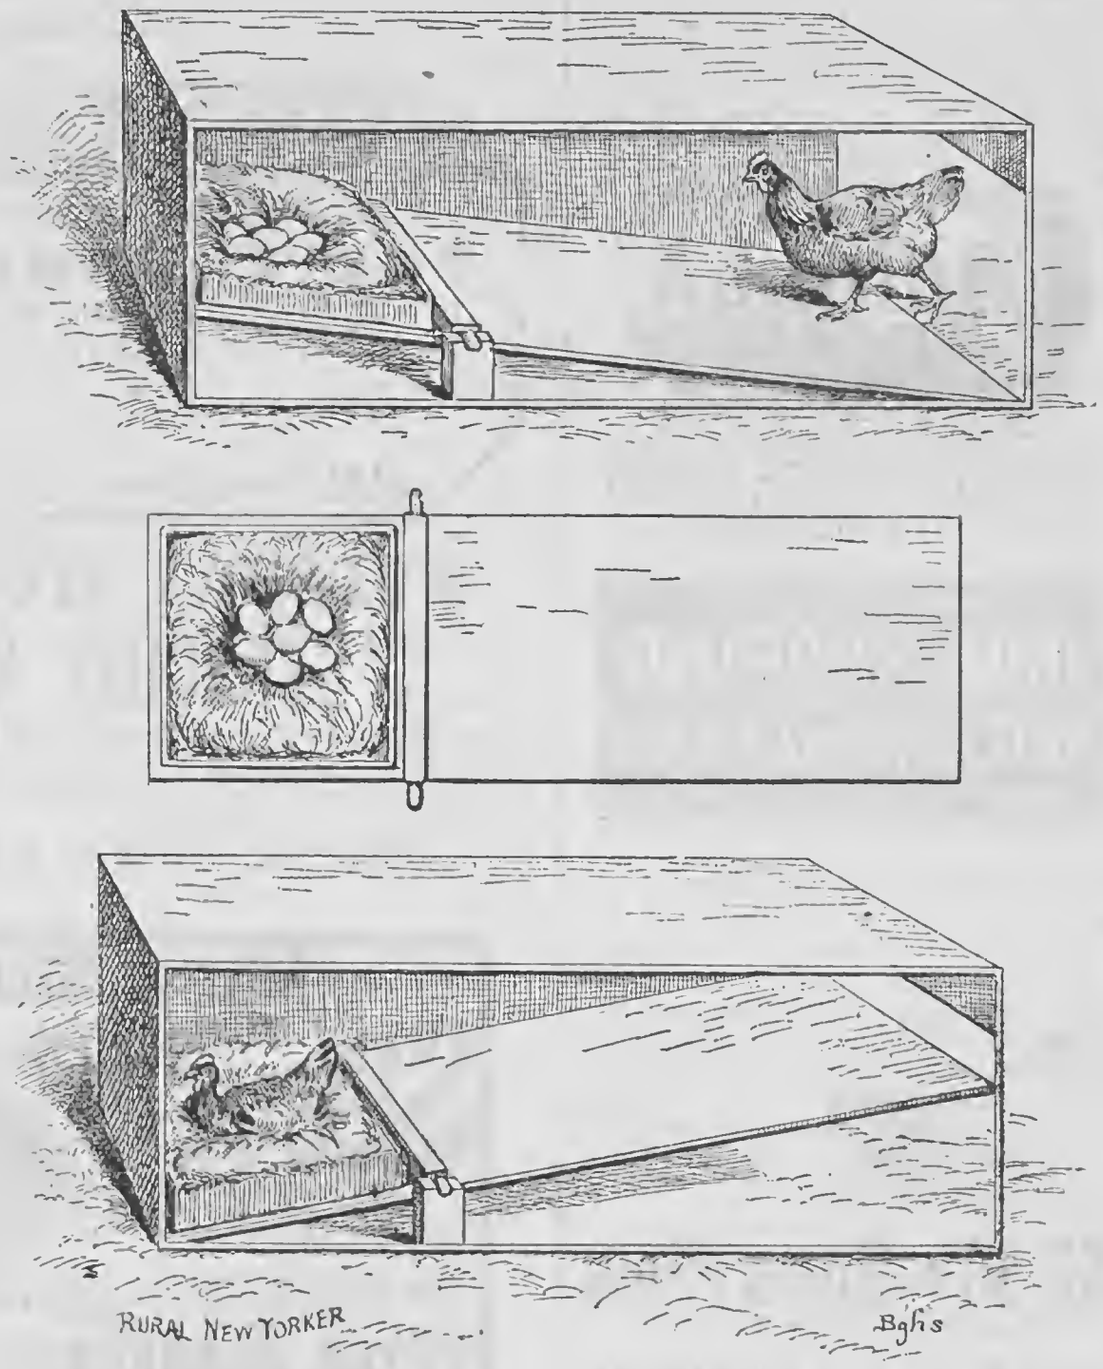
NEW YORK.



SELF-CLOSING NEST. Fig. 203.

MR. H. S. CHAPMAN saw, in a former RURAL, a description of a self-closing hen's nest. He has one which he likes much better. It is shown above at Fig. 203, and so well drawn that it requires but little explanation. It is made out of an old boot-case. The nest board is two inches narrower than the box, so that it can play up or down. It is balanced on the blocks of wood, as shown in the drawing. The nest is made by using an old tin pan or a box filled with straw. The weight is regulated so that when left alone the box will be open. On the entrance of Mrs. Wyandotte, the nest drops so that the opening is closed, and will not open as long as she stays on the nest. It is a bad plan to let hens crowd into a nest together. They will be apt to quarrel and break eggs. Why would not this arrangement work well with sitting hens?

COOLEY CREAMERS.

LARGELY IMITATED, BUT NOT EQUALED.
THEY HAVE A PATENTED PROCESS
WHICH NO OTHERS CAN USE.

Are used by more fine butter makers and stock breeders than any other apparatus, because they have proved to make the **largest quantity** and **best quality** of butter with **least labor** and **exponse.** They surpass everything in the Cream Gathering System. **Have both Top and Bottom Skimmers.** Cream drawn FIRST or LAST. *No danger or sediment.* Thick walls with dead air space. Used with or without ice.

SIX GOLD Medals and SEVENTEEN SILVER Medals awarded for superiority of process and product. Send for circulars giving facts and references sustaining these claims. DAVIS SWING CHURNS, EUREKA and SKINNER'S BUTTER WORKERS, CARRIERS, PRINTS, and a full line of Creamery supplies.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1894. NEW YORK, MAY 15, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

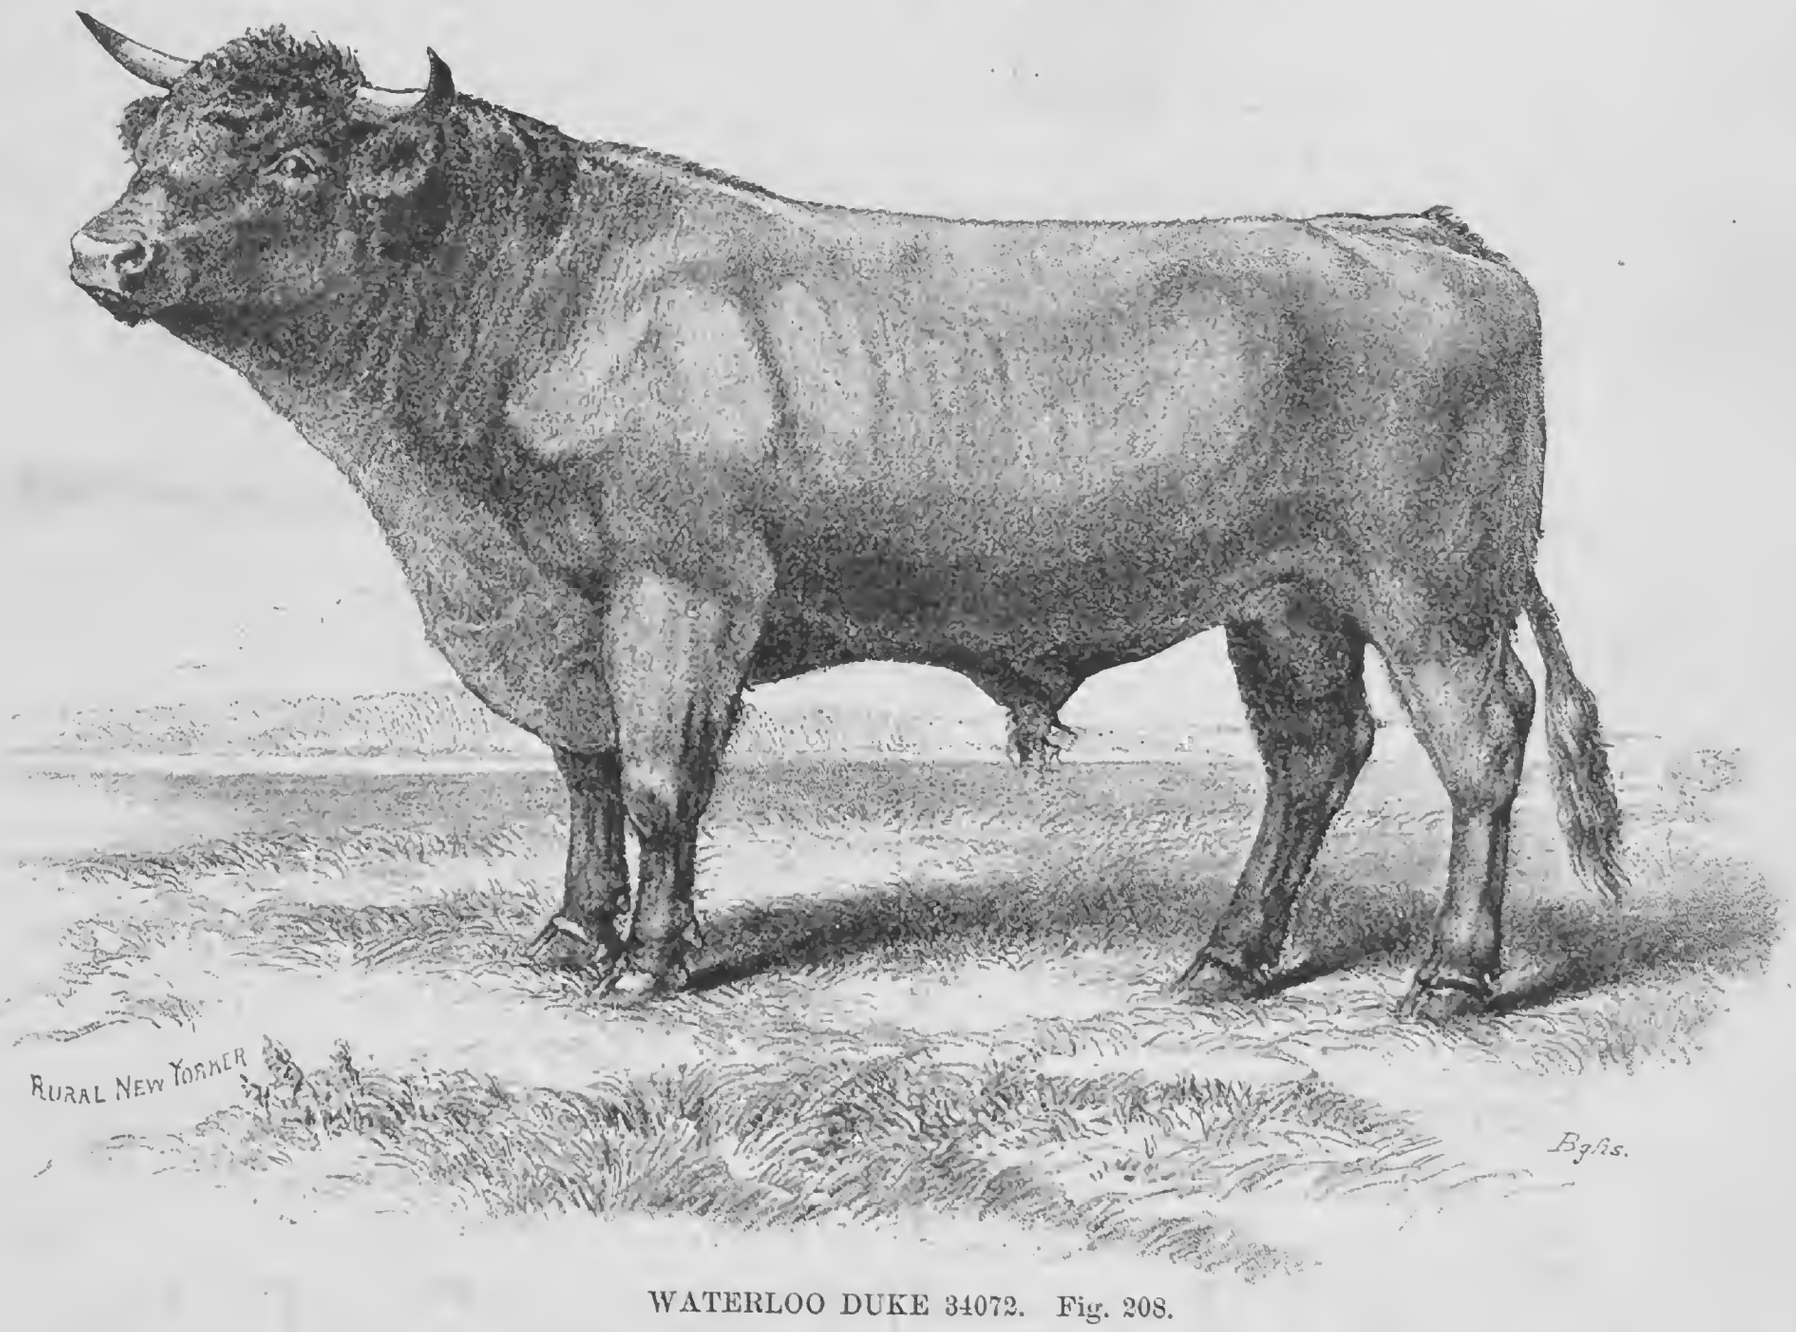
Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Herdsman.

WATERLOO DUKE 34072.

THE fine Short-horn bull shown at Fig. 208 is owned by Prof. A. J. Cook, and is held for service at his stock farm near Owosso, Michigan.

Waterloo Duke was bred by the Canada West Farm Stock Association of Brantford, Canada, Ontario. He was sired by imported Fourth Duke of Clarence, and is out of Oxford's Waterloo 5th. He is half brother to Clarence Kirklevington, the premium steer at the Chicago Fat Stock show of 1884. He is a wonderful stock getter, his superior excellence being transmitted to his progeny. His present weight is 2,500 pounds. The Waterloo tribe is famous in Short-horn literature, being considered one of the best of the Bates tribe. The picture is taken from an inferior photograph and is a trifle faulty in the fact that it makes the animal appear lighter in the hindquarters than he really is; otherwise the likeness is excellent. Prof. Cook is to be congratulated on securing this fine animal to head his excellent herd.



WATERLOO DUKE 34072. Fig. 208.

Sheep Husbandry.

Notes from the Western New York Farm.

LAMB FEEDING.

ARE ROOTS A NECESSITY?

WHEN chemistry shows roots so largely composed of water and of such low nutritive value, can we not substitute water to good advantage by wilting or soaking the dry food? We have received many letters of late, of which the above gives fairly the gist. We have by far too much respect for science and the agricultural chemists to belittle in any manner the one or to slight the deductions of the others, and yet we must be excused if we say we would much rather have the practical results of feeding a half dozen sheep with and without roots to the closest deductions of any chemical tests. The chemist when he analyzes the hay made from the growing grass, tells us that it contains, in a concentrated form, all the growing and feeding value of the grasses; but we all know that an old cow will make much more milk and butter when eating the succulent grass, though really taking much less actual nutriment. This is true, even though the hay were to be cut, soaked and steamed. There is some peculiar influence which this succulent food exerts upon the animal's mechanism, of which the chemist as yet can take no account, but which every feeder has, time and again, proved to be real. We have on many occasions fed different pens the same dry ration and, one with another, without roots, and in not a single instance have the roots failed to produce a better result, many times over paying the cost of production. Not only this, but as we have before said, the liberal use of roots will enable the sheep to eat and digest, profitably, a much larger proportion of dry forage and grain. If roots are mostly water, we would almost as soon think of keeping our sheep and lambs without forage as without a liberal supply of roots.

MANGELS AT FIVE CENTS PER BUSHEL.

Can they be raised for this, and, if so, how? More than 20 people have asked these questions. Let us consider the answer:—We raise, each year, from six to ten acres, and we have very seldom had a crop yield less than 1,000 bushels per acre, and we have had over 1,600 bushels. We think 1,200 no more than a fair average yield on good land, so that if we can raise and harvest the crop for $60 per acre, we get the roots at five cents per bushel. The way we secure such a crop is as follows:—We prefer a good, strong loam, and a one-year-old clover sod is first-rate, though a piece of corn or potato ground answers a good purpose if it was manured for the crop the previous year. We had a fair crop last year on a clover sod, and we shall plant this year on the same kind of fitting. In the Fall or early Winter we apply 15 loads of our rich barn manure spread from the wagons or sleighs. As soon as the barley and oats are sown—or sooner if in proper condition—this should be plowed and at once rolled and harrowed to prevent its becoming lumpy. In a couple of days, more or less, it should be again cultivated, rolled and harrowed until the surface is smooth and fine and the under soil fairly compact. The seed should be sown at once,—the earlier the better, after May 1st—with a common grain drill, using every fourth or third tooth, as they are seven or nine inches apart, thus placing the rows 28 or 27 inches apart. In sowing, we apply 200 pounds of some good brand of superphosphate per acre, letting it all be distributed by the tube sowing the seed and the one on either side of it, which should be so tied as to run within five or six inches of the one sowing the seed. It is the poorest kind of economy to scrimp in the seed. The books all say, sow four pounds; we never sow less than six. We buy our seed of a hardware firm here, who import it directly from England and charge from 20 to 25 cents per pound, the price varying with the variety. By using an extra two pounds the extra cost is from 40 to 50 cents per acre, and we would need to get from eight to ten bushels extra in the crop to pay this; but by using so much seed we insure a full stand and get from one to several hundred bushels more. About one-fourth of our crop is of the Mammoth Long Red; the rest of the Yellow Globe or Golden Tankard. The Mammoth Long Red is a good yielder, and is in good feeding condition earlier than the others; but the others yield fully as well, are less troublesome to harvest and keep much better for later feeding.

As soon as the rows can be nicely seen, run a hand cultivator (we prefer the Planet, Jr. as close to the rows as possible; if this is properly done, not more than an inch-and-a-half will be left uncut. In a week give a working with a horse and cultivator; and a couple of days afterwards go over them again with the hand cultivator and then "chop out." This is done with a common hand hoe ground sharp. Leave six inches of the row and cut out one foot, and again leave six inches, thus leaving hills six inches along the row and one foot apart. As soon as the leaves of the young mangels are three inches long they should be weeded and thinned. In doing this, use the hoe and fingers, and leave from three to five plants in each hill. This gives a greatly increased yield and prevents the mangels from becoming so very large and coarse, as they will when thinned to single plants. After this they should be cultivated often, and any strong weeds that have been left should be pulled.

HARVESTING.

In this latitude it is not safe to leave the mangels in the ground later than October 15,

as they are quite sensitive to a hard frost, and one hard enough to cause the skin to blister greatly injures their keeping quality. It is better to remove them to the cellars or pits on dry days, and it is most cheaply done by having several teams and wagons and two men in the field to pull and load and one at the cellar or pit to unload. We have the wagon driven by the side of the growing mangels; the driver pulls one row, and each of the other men pulls two rows. Each has a leather "harvest mitten" with one finger on his right hand, and pulling the mangles he places the finger of the mittened hand about the top, and with a slight twist removes the root completely and at the same time throws it into the wagon. As soon as the wagon is loaded, the driver starts for the cellar, another wagon taking the place. He goes to the cellar where a man has an empty wagon, unhitches his team, hitches to the empty wagon and starts for the field. The unloader has a rack or slide eight or ten feet long, 30 inches wide and made of slats 1x2½ inches, placed two inches apart and having sides four inches high; by allowing the roots to roll the whole length of this they are freed from nearly all adhering dirt and are put into good order for feeding.

STORING.

Whether stored in pits or cellars, mangels must be fully protected from frost, by which they are fully as easily injured as are potatoes. They must also be made dry before being stored in large quantities. When keeping in pits, we always place ventilators, such as drain tiles, or tubes made by nailing four boards each three or four-inches wide together, so that they project four-inches above the covering and down among the mangels. When putting on the final covering these should be removed, and the holes be stuffed full of straw.

THE COST PER BUSHEL.

Last year the account per acre was as follows:

Interest on land $150 per acre	$9.00
15 loads of manure, one-half charged to crop	7.50
200 pounds phosphate, one half charged to crop	2.00
Plowing	2.00
Fitting	3.00
Seeds, six pounds Tankard, 25 cents	1.50
Cultivating	6.00
Chopping out	1.25
Weeding	4.00
Harvesting	14.00
Total cost	$50.25

It will be seen that we have charged a large interest on the land; but it is good land, and as we would not sell it for less than the price mentioned, we have charged full interest, but as the crop was fully 1,300 bushels per acre, the cost per bushel was a little under four cents.

We have never seen such a sudden change from Winter to Summer. Three weeks ago, April 6th, it snowed all day, and the snow was a foot deep. Now—April 27th—wheat and grass are ankle-high, trees are beginning to leaf out. We are losing our Springs altogether. Wheat came through the Winter well, and now promises fair for a large crop. Our field of hand-picked Diehl-Mediterranean, on which we sowed only one bushel per acre, is as thick as a mat, and is as fine a field of wheat as we ever saw.

We have also a plot of the same cross as the Diehl-Mediterranean, and like it in every way—growth, width of leaf, color of straw, chaff and appearance of wheat—except that it is a perfectly bald wheat. We only had a single head of this, in the beginning, and have only just begun to realize its worth, and shall try to increase the quantity.

Our trial plot of some 60 varieties is now showing nicely, and among the number are several of the RURAL crosses which promise remarkable things. We shall say more of these bye and bye.

The Poultry Yard.

POULTRY NOTES AND SUGGESTIONS.

Love of poultry; poultry raising an avocation; feeding chicks; yards; buildings; cures; caution.

I DO not think it possible for any one to raise poultry and receive any great profit therefrom unless he takes pleasure in the business. When asked by those who, having little or no experience, wished to raise poultry for profit, whether I thought it would pay them to raise poultry as the whole or a part of their occupation, my first question has always been, "Do you love birds? Would you take great comfort in having them around you from morning till night?" If the person had no great liking for fowls, my answer was always, "No;" but if he had a real love for birds, and could make up his mind to give them the best care and attention, then my answer was "Yes."

If one has other means of support for a few years, or until he can make the business support him, and has common sense, let him get a few of the kind he thinks he would like best; take several poultry and agricultural papers that pay attention to poultry; use his best judgment to pick out the grain of good advice from the quart of chaff, and go ahead, increasing his stock as he gets experience, and he will be successful; but it is only now and then that one drops all other business for poultry raising. For the highest success, however, it should be carried on by itself.

Will some one who raises poultry and yet feels that it is not worth special care, and so, beyond throwing the fowls in the morning a quantity of grain to last till next morning, leaves them to take care of themselves, and who has kept an honest account of the outlay and income, give the figures showing the profit or loss? I am sure that in all cases where more than a very few fowls are kept, a loss well be shown.

Chickens should be fed at least four times a day till they are at least 12 weeks old, and for the next few weeks three times a day. Then separate from the rest all the pullets and as many of the best cockerels as will be needed for breeders, and feed them and the old fowls twice a day. The remaining cockerels should be allowed to range only in a good-sized yard, and should be still fed three times a day. If possible to avoid doing so, never feed corn meal clear, but mix with it one-half its bulk of shorts or fine feed. For chickens the finer the feed the better. If it is wet with hot water and allowed to cool before feeding, it is best. Feed corn, oats, oat-meal, cracked corn, wheat, etc. Do not feed chickens wheat till they are at least five or six weeks old. In cold weather, or when fowls are confined, feed plenty of scraps, shell, ground bone and cut hay. Let the last stand in water several hours after being cut before feeding. Chopped beets, cabbage, boiled turnips and potatoes are excellent.

A great many poultrymen say, "Don't get your fowls too fat." Good advice; but, "Don't let them get too lean," is as good at all times, and better during moulting. Do not feed young chickens on good, fresh eggs boiled, as very often advised. It will not pay. Sell the eggs; one seldom gets less than 12 cents per pound for eggs, and he can buy good, fresh shanks for three or four cents per pound. Boil them well, use the water to wet the feed, chop the meat, give a small quantity each day for a week or two, and it will answer the purpose as well as boiled eggs, if not better.

If one is keeping a small number of fowls, or as high as 100 or more on a farm, he should not confine them more than necessary. But if one is keeping large numbers, or where they can destroy crops, etc., they should be confined in flocks of about 50 to a yard. Better to have two yards to each flock than to have all in one. Then let them into one yard first, and then into the other for a few days at a time. I have and do keep larger numbers in one fair-sized yard, and take care to supply all they need as nearly as possible, and have them do well. I have kept breeding fowls in small yards, and by giving extra care have done fully as well as if they were at large.

Seeing that the houses are kept free from insects and are bright and clean is, I believe, the main point in successful poultry raising. Poultry buildings, need not be very costly or elegant; but they must be warm, tight, fairly well lighted, and placed where the ground will not get soggy, and where water will not stand around them in wet weather. If one wishes a dirt floor (but I advise a board floor in all cases), fill in with dirt at least four inches above the ground outside, and when you scrape up the droppings, be sure to take a thin layer of earth. When the earth layer has nearly all been removed in this way, fill up again with fresh earth. A board floor is easy to keep clean, if a little sand is scattered over it as soon as the droppings are scraped up.

When fowls are confined in cold weather the houses should be cleaned every morning. When they are at large, twice a week; when in yards, once in two days. Rub a little of some kind of grease or oil on the roosts once in awhile. Put fine tobacco or sulphur in the nest. Good dust boxes, plenty of dry earth or road dust thrown in all cracks and corners, will keep poultry free from lice.

I have never kept over 150 fowls over Winter; but whatever number I have kept I have found they paid a fair profit when rightly handled. As a rule, where keeping 100 fowls would pay, keeping 1,000 would not, because it would be more work to tend to all their needs, market the eggs, etc., than one man could possibly do. With the help of a stout boy he might accomplish the work, however, if he understood how to make the most of his time.

Where buildings are extra warm and sheltered, and eggs are desired more than meat, the Leghorn is the best breed here; but for hardiness and for both meat and eggs, the Light Brahmas and Plymouth Rocks; but the progeny of a cross of both with Leghorns would be better; preferably with White Leghorns.

The hatchet and block are the best cure as soon as there is a sign of disease. But fowls that are kept from drafts in their buildings, free from lice, fed wholesome food and kept from getting wet, and supplied with pure water, will be almost entirely free from disease.

To all new beginners, or those with but little experience, let me say: Use the hen for an incubator and brooder; but if you must have an incubator and brooders, do not buy or build an incubator that will hold over 100 eggs, and then it would be best not to fill it more than half the first two or three times, as that will be enough eggs to lose. When you have learned to get a fair hatch by taking the right kind of care of the eggs in the incubator, and of the chickens in the brooder, and want to increase your business, buy more rather than larger incubators.

Poultry raisers should not be so fond of bragging about the vast number of eggs per hen they get every year, or of the big profits they get from the eggs and dressed fowls; for they really deceive nobody except the ignorant; and sometimes some of these, inspired by such exaggerations, rush into poultry raising as if there were a bonanza in the business, and soon lose all they have been perhaps years in saving.

A PRACTICAL POULTRYMAN.

Providence Co., R. I.

MANAGEMENT OF WINTER LAYERS.

Leghorns; ventilation; sheds; exercise.

THE past Winter has given an opportunity for testing the merits of the different breeds as winter layers, and in so doing many theories have been overturned. Although the temperature has seldom been below zero, yet it has been far enough from the freezing point to injure all hens with large, single combs. The truth of the supposition that the Asiatic breeds are the best winter layers depends upon how the hens are managed. In every case where the Leghorns have been comfortably housed, they have given as good results as they usually give during the Spring and Summer. A very important matter in the winter keeping of hens is ventilation, and it is one of the most difficult of all the problems to solve. The majority of poultrymen recommend some kind of opening near the roof of the poultry house for the escape of impure air; but as the impurities are heavier, as a rule, than the atmosphere, and especially in cold weather, they sink to the floor instead of ascending, and the so-called ventilators near the top, instead of allowing the impurities to pass off, simply permit the escape of heat and admit cold currents, which invariably occasion colds and roup.

As the hens are partial to an open shed, it has been found an advantage to so construct the poultry houses that they will serve as open sheds during the day while the fowls may be protected from the winds and severe cold at night. This is done by placing the roosts at the rear, with a hinged board or door falling in front to inclose the fowls while on the perch. During the day the hens exercise by scratching in the open houses, and deposit their eggs in nests under the roosts. This is the true condition for keeping fowls—allowing them a covered space open to the air and sun—and they keep in excellent health under such a system. Every poultryman knows that hens are not fond of a closed poultry house during the day, and will abandon one that is warm and comfortable in order to have the benefit of any kind of shelter that is partially open, as by nature they prefer plenty of light and fresh air. Hence, though fowls should be kept warm and comfortable at night, when they are inactive, yet to secure the best results they require exercise in the open air during the day. This exercise keeps the blood in circulation, increases the appetite, works off the surplus fat and conduces to reproduction.

During the Winter all fowls that have fully matured are liable to become very fat, unless made to exercise, and it is safe to assert that more disappointments result from the hens being too fat than from any other cause. It is best to feed them well so long as they have plenty of exercise; but it is an injury to do so when they are shut up. Hence, in order to induce them to work, they should be allowed only a partial meal in the morning, thus forcing them to seek the remainder of their feed during the day by scratching in cut straw, leaves, or some other suitable material, giving them all they can eat before going on the perch in the evening. If the roost is in a close poultry house, ventilation may be best secured by a tube or pipe beginning within an inch of the floor and terminating through the roof, with a cowl over the top if convenient. So far as the use of open sheds is concerned, something depends, of course, upon the locality and the severity of the climate; but it is not necessary to suggest any particular plan for combining a warm place at night and a shed during the day, as each person interested may conceive of special plans; but a shed 15 feet long, 10 deep, five high at the rear, and eight in front, with a portion closed at one end, say five feet for the roost and nests, thereby leaving a space 10x10 for a shed, will be cheap, and it should accommodate at least 15 hens, the general rule being to allow one hen to every foot of the front, which affords ample room and prevents crowding. A SUBSCRIBER.

ROUP.

Nature of the ailment; progressive symptoms; treatment.

ROUP is nothing more or less than a severe cold in the head and may be either acute or chronic. Any cold is liable to develop into roup. Catarrh is another form of the same thing. Many claim that canker is a form of roup; but I have frequently had cases of canker without any sign of roup, and *vice versa*. I never lost a hen from canker; but I cannot say that of roup by any means. The first symptoms of roup are a heavy breathing, noticed by the distending of the throat as the fowl inhales, sometimes accompanied by a cough. Later there is a fœtid discharge from the nostrils. As fowls breathe habitually through their nostrils, the obstruction in the passage-way causes them to open their mouths to breathe—hence the gasping. Later the discharge dries upon the nostrils and prevents further running off, consequently the quantity of matter increases. Having no outlet it flows under the eyelids, causing them to distend, sometimes to the extent of blinding the birds, and death issues from starvation. Sometimes a froth appears at the corner of the eye, caused by the air passing up the tear duct, and making little bubbles. As the disease advances fever sets in, the bird loses its appetite and will stand and drink until the water runs from its mouth whenever it lowers its head, thereby polluting the water and spreading the disease, which is highly contagious. The feathers soon lose their glossy appearance and the birds stand moping in a corner, evidently in great pain.

As treatment, first of all remove the bird to warm, dry quarters; feed a variety, with plenty of green food—onions preferred—and give a little Douglas Mixture in the water. Give also a pellet of the following mixture every morning and evening for three days:—One teaspoonful each of Cayenne, ginger, saffron, chlorate of potash and powdered rhubarb; one teaspoonful of tincture of iron; three tablespoonfuls (about 1½ ounce) of hyposulphite of soda and one ounce of powdered assafœtida. Powder and mix well.

I got the above receipe several years ago, and have lost but few fowls since. I once bought a few fowls that caught the roup in transit, and it spread, through my neglect, until 52 of my flock had severe attacks, yet I lost but two. If the eyelids are swollen, bathe in camphorated oil. The scab should be removed from the nostrils as often as possible. A slight pressure of the finger at the back of the roof of the mouth will cause the matter to flow abundantly. Kerosene and Cayenne will sometimes cure light cases. Many prominent breeders recommend it highly; but I have found nothing that is absolutely sure in the later stages of the disease. The only true way to treat it is to prevent it by careful attention to the minor details and by proper housing in bad weather. A. R. CROWELL.

Middlesex Co., Mass.

POULTRY OBSERVATIONS IN THE SOUTH.

WITH proper care, fowls are as productive at the South as they are at the North, and are decidedly larger. There is a perceptible difference in size between Southern and Northern specimens of the same breed. The White and Brown Leghorns seem to be best adapted to a warm climate. Light Brahmas and Plymouth Rocks do well here. A cross of Light Brahmas on our native fowls will give the healthiest chickens we have. So far as I have observed, fowls in a warm climate, with good care, are as healthy as they are in a colder climate. To improve the farm poultry, I would advise buying eggs of thoroughbred fowls, hatching under the common hens, and crossing upon the native stock. The best flock of hens I ever saw in this country was made up in this way by securing a sitting of Light Brahma eggs and letting the chickens run in with the common poultry. No man has any business to keep poultry, who will not put a fence between them and his garden. It

would be much cheaper and better to have a yard for the hens. It is cheaper to fence them in than to fence them out. We can sow Burr clover in their yard, and thus secure good green pasture for the hens. N. B. BRIDGES.

Starkville, Miss.

BRIEFS.

CELERY—As usual, I find that Boston Market has kept better than any other variety, white or red. For winter use, celery should be sown about the end of April, or early in May. Sow in the open ground or a cold-frame, and merely shade a little from warm sunshine.

WITLOOF is a large-leaved form of chicory, and a capital winter vegetable for use in salads. Sown in May or June in rows like carrots, it forms strong roots before Winter, and is not liable to run to seed. We lift it at the same time we lift our other roots in the Fall, store the roots in sand in the cellar, and, as we pack a lot together heads up, in moist earth in deep boxes, and bring them into a warm, dark place, growth soon begins, and heads of yellow leaves are pushed up. These are the parts we eat.

SNAP BEANS—For the very earliest and latest I like White Flageolet, not because it is the best bean (for it isn't); but because its pods are about fit to eat by the time most other sorts come into bloom. Mohawk and Valentine among green-fleshed sorts are my stand-bys. The stereotyped advice is "sow once every two weeks during Summer for succession." Well I don't go by that advice; instead, I sow twice every week from the end of April till the first of September, and I am never without beans from June till October anyway, and I always have them brittle and tender.

SUCCESSION SOWINGS.—Take peas or beans or corn, for instance: many people sow the mid-season and late varieties of any of these at the same time, and in this way secure a succession. Well, this is an easy way of doing it, but a very uncertain one. Take peas, for instance. My plan is to sow Alpha twice a week from the end of March till into May, and Champion from early April on. My May Alphas will come in in time to catch on to the April Champions, and so on.

MANY VARIETIES, except or experiments sake, are a nuisance. When you have determined what variety best suits your land, stick to it. Take corn, for instance; you don't want an extra-early variety, an intermediate, and a late. If you think a gain of three or four days in earliness worth growing an extra early variety, then well and good; if not, sow but one variety, and each succeeding week till August put in a few more seeds of it, and it will give you an uninterrupted supply of corn from July till October. No corn that I grow gives me better satisfaction than Concord. Now, neighbor Lucas complains that it isn't as good with him as are some other kinds.

ASPARAGUS.—I began cutting April 21st, and shall continue to cut till the first of July. Asparagus is the farmer's vegetable. As a farm crop it is one of the surest, most marketable and profitable that he can grow. For home use there is nothing better. Once set out, the plantation is good for 20 years, and we can cultivate it entirely by horse power. It comes in in Spring when we have very little other, if anything, in the way of fresh, green vegetables. Spinach in the open ground does not always winter well, neither do German greens; the cabbages stowed away over Winter are about used up, or have begun to rot, and the early cabbage won't be in for some time yet. Unlike peas or beans that last so short a time, asparagus lasts in good cutting condition for nine or ten weeks, and we needn't bother about successions. Asparagus comes in at the time when we are busiest with our other crops, and then all the care it needs is to cut and eat. Before the asparagus season is over we have cabbage and cauliflower, peas, beans, spinach and other vegetables.

Farmers needn't growl about bother with garden truck so far as asparagus is concerned. It is cheap enough to begin with. A thousand two-year-old plants cost only $8 to $10, and a thousand plants would set out a row 700 yards long, or seven rows 100 yards long. He may sow the seed and raise his own plants. Plants at three years old will yield a fair cutting; at four years a full crop.

Long Island, N. Y. WILLIAM FALCONER.

I HAVE found that fall-sown spinach is easily killed with kindness. The books tells us to give the young plants a slight covering of leaves or other litter for winter protection. Three years ago, I covered a large bed after the most approved method, and every plant winter-killed. Some plants that came up by accident outside of the bed were saved. Since then I have not protected fall-sown spinach, and almost every plant has survived.

THE rules of horticulture do not always hold good. For instance, I read not long ago, an article on ferns, written by one of our best florists, in which the writer said that it was utterly impossible to grow ferns without thorough drainage of the pots; still a lady of my acquaintance succeeds admirably in growing different species of this beautiful plant in large sea-shells, which have not the shadow of an aperture for drainage. Again we are told that it is useless to try to keep squashes through the Winter except in a dry, and moderately warm place. As a matter of fact, however, I have kept the past Winter a sample of the Hubbard Squash in a room connected with the greenhouse, in which the atmosphere has often been so damp that the condensed water has run down the walls, which are now much mildewed. This squash remained sound until after the first of April.

WHY is not the celeriac more esteemed? I regard it as one of the best vegetables we have for late winter and spring use. The flavor is more marked and delicate than that of celery, and it lacks the stringiness that the latter vegetable has when cooked. Packed in sand during the Winter, the roots remain plump, and the flavor becomes more delicate the longer they are kept. It may be grown without hilling up, and is as easily kept as beets or parsnips.

WHAT is the objection to covering the bulbs of onions with earth while they are growing Last season I made the experiment of hilling up the rows of a small plat of extra early red onions when the bulbs were about half grown. I could not see that the size of the bulbs was diminished, while the quality was certainly better than in the same variety grown in the usual way. The bulbs were more tender, sweeter and milder. They were slightly soft, but kept nearly as well as those not hilled up.

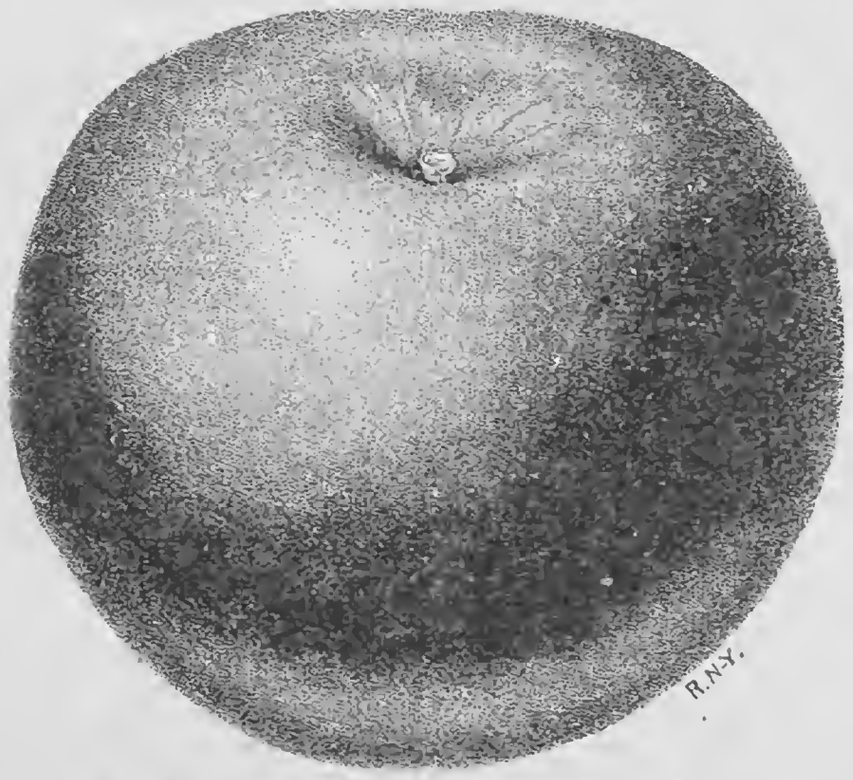
I AM glad to note that public opinion is being aroused against the wholesale destruction of the smaller birds to gratify the demands of fashion. By the way, what has become of the barn swallows? I can well remember when the eaves of my father's barn were lined with a row of the large mud nests of this interesting bird. But for several years past, I have not seen a single swallow's nest, either on my father's barn or elsewhere. It seems to me that the almost total disappearance of the swallow from our barns within so short a period, is a very strange circumstance.

THE neatest covering I have ever seen for benches in a green-house is moderately fine sifted gravel. It has a singular appearance, and the additional advantage that the roots of plants, creeping out of the bottom of the pots, do not attach themselves to it, as they do to sand or earth. E. S. GOFF.

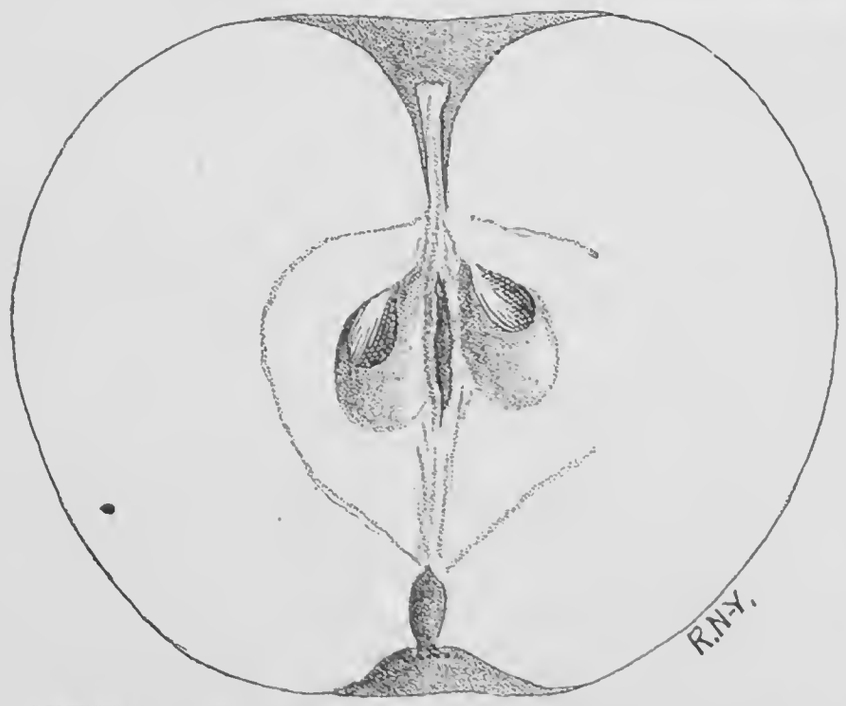
Pomological.

THE ARKANSAS BLACK APPLE.

SPECIMENS of the Arkansas Black Apple, illustrated at Fig. 209, were brought to this office by our friend, J. B. Rogers, of Essex Co., N. J., who got them during a visit to St. Louis. The apple is large, conical, a little one-sided and very heavy. Indeed, it is the heaviest apple of its size we have ever seen. Stem medium, three-quarters of an inch long, slender, planted in a narrow, regular cavity of medium depth. Calyx small, closed in a small, shallow, uneven basin. Color a dark red, shading on the sunny side almost into black, the whole surface irregularly marked with light-yellow dots. The cavity is a little inclined to have russety patches in it. Skin the densest and most resisting we have ever seen on an apple; where broken or cut the edges are almost as sharp as a knife. Core small and having few seeds a yellowish shade of white. Flesh very firm, fine-grained, breaking and juicy, and though so hard, by no means tough. Quality very good. Flavor pleasant, something like that of the King. A desirable market apple.



ARKANSAS BLACK APPLE. From Nature. Fig. 209.



ARKANSAS BLACK APPLE. (Cross Section.) Fig. 210.

Dairy Husbandry.

BUTTER MAKING AS A BUSINESS AND AS A CHORE.

WHILE I am a farmer and interested in the welfare of every branch of farming, it seems to me that the RURAL is over-zealous in its defence of butter against oleomargarine. For my part, I consider the "oleo" much better than the RURAL paints it, and the butter—the bulk of it—much worse. As between "oleo" and average butter, I prefer the oleo, and am confident that a large majority of those people who are limited to one or the other, have the same preference. To clear myself of any suspicion of perverted taste or pecuniary bias on the subject, I will say that I, farming in Kansas, buy my butter of a dairy in Michigan, and have it sent me by express, a tub at a time, as I need it. Does the RURAL realize what disgusting stuff country butter often proves to be, or how carefully the best oleo is prepared? The ingredients of the latter are no secret—they are nothing but good butter, tallow and lard. What better is the fat that comes out of a cow's udder than the suet of her loins, or how is good lard, so manipulated as to be palatable, more objectionable *on* the biscuit than *in* the biscuit?

Let me outline the history of that grade of butter which suffers most from competition with oleo. It is manufactured in small lots by tired housewives, ignorant of the best methods, provided with inadequate appliances, having no ice in Summer, no spring-house, no "milk room" but a tin safe in the kitchen. This meager product, prepared at such a disadvantage, by hands perhaps already over-tasked by other work, is sold or traded to the "store," where it is packed with other lots from the neighborhood, of all colors, streaked, yellow and pale; the over-salted, under-salted, milky, hairy and bald all go together, and the mixture is consigned to the city commission merchant. The bulk of that butter goes to the "bull butter" men; who mix it, rework it, wash it, churn it in sweet milk (as oleo is churned by the way) sweeten it, color it uniformly and make it quite presentable. They put it in a neat package, just as oleo is packed, and mark it with a lying brand "Rock Spring Dairy"—when, in truth, it had its second birth in a sub-cellar of the city. Both oleo and "bull butter" are improvements: they are frauds only when they pretend to be what they are not.

There are cheats in all goods; shoddy cloth, paper leather, chicory coffee and oleo butter. I should like to see everything sold on its merits, and marked with its true name; but I have no expectation that butter can be given exceptional immunity in this respect, or be freed from imitation by laws. The greatest possible help for it would seem to be in the hands of the butter-makers themselves, and would be simply to make all the butter "gilt-edged"! Then where would the oleo come in? Why, the dairymen in their independence of it could emulate the farmers of Colorado who are said, by irrigation, to carry their indifference to rain to the point of making faces at the clouds.

Is there anything chimerical in the suggestion that all the butter that is made might just as well be made good? No appreciable additions would be required to the "plant;" the same cows would do, the same pastures, the same feed and even less labor—and compared with all these the expense of necessary fixtures would be a bagatelle. The principal requirement would be to bunch the cows into dairies large enough so that butter-making would become a business instead of a chore.

Is it not the case that where people make a business of butter-making, they commonly make it good? Is it not also the case that where they commonly make it as a "chore," they commonly make it poor? The man who makes my butter doesn't care whether oleo is branded at all, or colored green or brown, or given away. His clientage is secure. His goods are uniform, reliable, gilt-edged. He gives his mind to his business and finds enough in it.

Wyandotte Co., Kans. EDWIN TAYLOR.

R. N.-Y.—The RURAL has never uttered a single word in excuse of poor butter; it has printed numerous columns urging improvement in the manufacture of butter, and telling how to accomplish it. It has never denied the existence of a vast deal too much miserable stuff, deserving the name of grease rather than of butter; but how can the manufacture of a genuine article be improved by the fraudulent substitution of a counterfeit commodity? This poor stuff generally comes from people who must make that or nothing, because they have neither the time, conveniences nor, above all, the knowledge and skill to turn out a better article. The low prices they get for their butter, owing to the competition with counterfeit products, instead of stimulating them to improvement, discourage them and lead to greater carelessness. Since the introduction of bogus butter has the production of inferior genuine butter decreased beyond what might naturally have been expected from progress in dairy education, the introduction of improved dairy appliances, and the extension of the creamery system? Had bogus butter never been invented, would not all these agencies for improvement have been just as active and effective as they are now?

We hear a great deal of the merits of the production from those interested in the manufacture and sale of bogus butter. They claim that it is as healthy as the best butter and much more palatable than a large part of the "rancid stuff" sold by grocers. Why, then, hasn't one of them come boldly into the market with this "healthy, superior product" in its natural state, and sold it for what it is on its own merits? Had this been done from the outset, dairymen might have been injured by the competition, but they would certainly have had no just cause to clamor for repressive legislation. Had it been offered for sale for what it really is, and in such a guise that no purchaser or consumer could be defrauded in obtaining or using it, who can for a moment think that the present outcry would be raised, not only from one end of this country to another, but in every other nation where the fraudulent concoction has been palmed off on the public for genuine dairy butter, and this has been done from first to last wherever it has been offered for sale.

The processes for making the concoction are patented, and there is no secret about its preparation. The principal manufactories in this country are cleanly, and pains are taken to deodorize the product, and get rid of all disagreeable tastes and smells; but, at the best, a discussion of the manufacture is not a pleasant theme for those troubled with squamish stomachs. We are constantly referred to the unexceptionable products of the large, clean manufactories; but which of the friends of the concoction ever refers to the multitude of little dark, filthy holes wherein all sorts of foul, rancid, deleterious fats from all kinds of animals are manipulated by frowzy, dirty workmen to produce an article that can be sold for a price as much under that asked for prime oleomargarine as the latter is under that for which good genuine butter can be offered?

The fact is that little, if any of the stuff could be sold for table use were it duly labeled, and were the entire operation legibly printed on the inclosing package. A little cream or butter is stirred into it to give it a butter flavor and annatto is used to give it a butter color, simply to enable the dealers to sell it for genuine butter. The manufacturers, big and little, are aiding in this fraud. They are turning out an article made of common fat from the carcasses of dead animals, compounded with gastric juice "made from macerating the stomach of a sheep or pig," and coloring and flavoring it to imitate butter, with the sole object of enabling dealers to impose on the public. Hotel and boarding-house keepers, and other large purchasers may know what they buy; but these, for gain, dishonestly palm it off as genuine butter on the consumers. Even if the manufacturer sells the dealer every pound of it for exactly what it is, he has made it for a fraudulent purpose, and knows that the consumer will be cheated, and is therefore morally as guilty as if he had stamped on every package of it "Pure Orange County Butter" and peddled it as such at his own door. The truth is that if the elements of fraud were eliminated, the entire business would collapse. Away, therefore with all the talk about persecuting the manufacturers of a healthy product from the fat of dead animals "with a view of destroying an important American industry." If the manufacturers were to leave out from their dead animal fat, only what is added purposely to cheat the consumer, they might fry out every dead carcass from Canada to the Gulf, apply to it all the gastric juice found in the stomachs of all the dead pigs in the country, and however large the sale they might obtain for their pale product, the clamor for anti-oleo legislation would be reduced to a growl from a few still disgruntled dairymen, and a murmur from the many sanitarians who might fear ill-effects from a product into the composition of which so many unwholesome substances might enter without much risk of detection.

AN ANTI-SELF-SUCKING DEVICE.

A NUMBER of our subscribers have written us of late that their cows had become addicted to sucking themselves. It has been proposed to apply various bitter preparations to the cows' teats, so that the taste would break off the habit. These remedies rarely have the desired effect. They must be applied every day, and there is danger of contaminating the milk. A leather strap fitted with sharp nails, fastened around the nose, is effective, but the safest treatment after all is to place the cow in such a position that she cannot reach the teats. A device which will work well is shown at Fig. 218. The drawing was sent us by Mr. T. H. Staplin, Jefferson Co., N. Y: *a* is a wooden yoke; *c*, a leather band; *b*, is a strap fastened to *a* at *d*, and to *c* again on the other side.

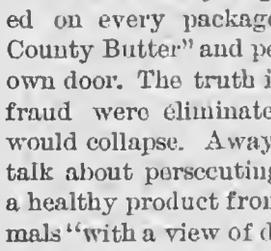


Fig. 218.

Horticultural.

HORTICULTURAL BOYCOTTING.

ONE would suppose that in these days of "boycotting," all the attempts to apply it to business purposes were quite sufficient without introducing it into scientific matters. Its odious character has, as it should have, the contempt of every intelligent man. Yet the RURAL'S respected correspondent, T. T. Lyon, in a late RURAL, comes out flat in favor of the principle as applied to pomological matters, and, like the great railroad magnates, declares he will not recognize anybody or thing which does not do as this or that society prescribes. Thus, with regard to the wholesale change of the names of fruits by the American Pomological Society he says: "The rules of the Society declare explicitly the right of the originator to name his origination; but, nevertheless, the Society declares that if an objectionable name be bestowed, it will refuse to recognize or consider the same until the objectionable feature shall be abated."

Possibly any cultivator who might happen to raise the finest fruit of any kind—apple, pear, grape or strawberry—ever produced, would not care a fig what a pomological or any other society might declare about the matter. It is the great public he wishes to reach, and though he certainly would hope to have the good wishes of such an association, designed to promote pomological information, it would in no way be essential to, or detract in any way from the importance and excellence of the variety. Neither coercion, prohibition nor boycotting will avail much in such a case. If Mr. Lyon rightly interprets the declaration of the American Pomological Society to be what he says, we can only regret any such action.

In the article alluded to by Mr. Lyon, I stated distinctly that the remarks of the President of the Society represented precisely my own views, so far as the recommendation to adopt only plain, characteristic or appropriate names. That was all we could do. There is not and could not be any law to prevent any originator of a new fruit from giving it a name, no more than for denying him the right to name his own children.

But it was not in regard to the future but to the past, that I object to these "new" names, and not because of any particular reverence for them as such; but because of the endless confusion the change is likely to create. Because Mr. Downing thought the Revising Committee "might properly have gone even further" in the list of revision, does not justify their action, or add anything to their authority to do so. There is no objection to nicknames, and nurserymen and cultivators who have no time to write them in full, could abbreviate as much as they please. Because it is not very important whether a pear is a Duchess d'Angoulême, a Duchess of Orleans or a Duchess of Bordeaux, Duchess is enough; or whether it is a Doyenné Blanc, a Doyenné Rose, a Doyenné Gris, a Doyenné Boussock or any other Doyenné. Either or all will do for a report or a label; but when we come to pomological works intended to promote the science, we want the entire and only name by which the variety has been, and I hope will continue to be known until it shall disappear by age, decrepitude, or unfitness for cultivation.

And this leads me to embrace the opportunity to thank my old friend "Horticola" for his hearty indorsement and support of the principles I laid down in regard to the alteration of old and authorized names. Those who never looked beyond a catalogue or one or two fruit books to learn the names of fruits, may think it needless to retain old names; but to one who has searched carefully through every English, French and Belgian work he could possibly procure, in order to obtain a knowledge of all the leading fruits known or introduced for nearly two centuries, to cultivate the greater part of them, to identify them and discover all their numberless synonyms, such attempts to change our nomenclature are simply discouraging to all progress, and lead us to believe that our pomology is nothing more than empiricism trying to become a science.

C. M. HOVEY.

Boston, Mass.

REFORM IN FRUIT NOMENCLATURE.

I NOTICE with pleasure the discussions that are now going on in regard to the proper naming of fruits. The RURAL exerts a powerful influence, and I hope it will aid this most important work so that hereafter we shall have no more improper, vulgar or superfluous names attached to some of our most beautiful fruits. Think of the more than two hundred varieties of pears that have Beurré prefixed to them. How useless the term Butter to Diel, Superfin, Hardy and most of the others of this class. But there are some exceptions which we cannot control, and must let Beurré Gris, Doyenné Gris, with some few others of a similar character, stand as they are. But if any one desires to retain the indecent and ridiculous names which some of our fruits now bear, out of respect to orthography or antiquity, let him do so; but let us no longer cumber or disgrace our catalogues by a continuance of them. "OLD DIGGER."

A HINT TO FRUIT GROWERS.

THE Wagner Apple is one of the best grown in California, for all purposes. It is fine for marketing—red, with yellow flesh, tender, juicy, large, a long keeper (till March), and very late to put forth blossoms. At this date, April 9, a month after other sorts began to blossom, the Wagner shows no signs of life in its branches. They are apparently as dead as last year's brush. For all regions subject to late spring frosts this habit renders the tree a sure bearer, and invaluable. Grafting may be done without hesitation, by transferring the same day from the Wagner into another tree. This is my experience. Try it.

Cloverdale, Cal. J. B. A.

A NEAT PEA TRELLIS.

FRIEND L. H. Turney, Fairfield County, Conn., says with regard to the pea trellis illustrated at Fig. 211, that it is made of two-inch-mesh wire netting. Two 12-inch strips are used four inches apart and eight inches from the ground, so that the top is 36 inches high. The 12-inch width is preferred simply because it is cheaper than meshes of

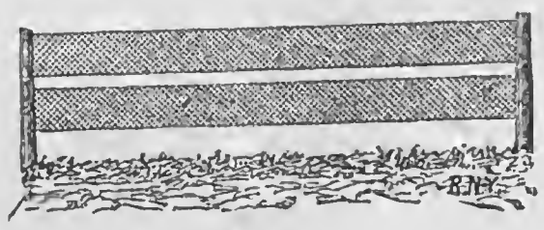

Fig. 211.

greater width. A strong stake is set at each end of the row of peas, and the wire is then drawn taut. He thinks this a decided improvement on the old bush method of supporting peas, as the crop can be cultivated with a minimum of trouble, and picked much more easily with this support than with the other.

Farm Topics.

THE SOURCE OF NITROGEN IN CORN.

SIR J. B. LAWES, BART., LL. D., F. R. S.

THE evidence derived from experiments in the United States is of such a conflicting character that it is impossible to draw any conclusion from it in regard to the source of nitrogen in corn. Inasmuch as it is a plant of the same natural order as the other grain crops, we might reasonably expect that corn would derive its food from the same sources, subject, however, to the great difference in its habit of growth.

At the present time there is hardly any one who doubts that nitric acid—either liberated from organic nitrogen existing in the soil, or as applied directly to it in manure—is the main source of the nitrogen of wheat, oats and barley. If these crops were sown at the same time, and, further, ripened at the same time as corn, we might expect that they would get a larger supply of nitrogen from the soil, and so be less dependent on a supply from artificial sources, as it is during the hot summer months that the nitrification of the soil is most active. The cultivation of corn in the States bears a strong resemblance to the cultivation of the root crop in this country; and the great increase in the growth of roots by the application of phosphates, has given rise to the idea that these broad-leaved plants derive much of their nitrogen from the air. This idea is not confirmed by our experiments.

At Rothamsted, in one field under continuous mangels, the land which receives abundance of mineral manures, but no nitrogen, grows five to six tons per acre of roots; but by the addition of rape cake, salts of ammonia, or nitrate of soda we can grow a crop of 20 to 30 tons per acre. In the next field, where Swede turnips are grown under experiment in an ordinary rotation of crops, once every four years, the crop manured with superphosphate only, rarely exceeds seven tons, while when the crop is grown with rape cake and ammonia it will, in a good season, reach 22 tons per acre.

It is quite useless for me to attempt the growth of corn as a crop; but I have grown some plants in one of my experimental fields, and have satisfied myself that—as regards the influence of manures—corn possesses all the characteristics of a cereal crop, and none of those of a leguminous crop. The effect of salts of ammonia, and nitrate of soda, was to increase largely the vigor of the plant, the breadth of the leaves, and—what is of special importance—the color of the leaf. There is something remarkably beautiful in the color of the leaf of a corn plant when abundantly supplied with ammonia or nitrates; but while we find that the application of nitrogen—as ammonia or nitrates—influences the color of the maize, as well as that of all our other grain crops, we do *not* find that these manures influence in any marked degree the color of the leaves of leguminous plants.

We have 12 to 14 leguminous crops growing in one field. Part of these are manured with salts of ammonia and nitrates, but as no one going over the experiments would be able to distinguish where these manures had been applied, I cannot admit that corn and leguminous plants have properties in common in regard to the sources of their nitrogen. It appears to me that all the evidence points to nitric acid as being the source of the nitrogen of corn, and the only way to disprove this would be by growing continuously very large crops of corn by means of mineral manures alone.

Rothamsted, England, April 20, 1886.

Farm Economy.

A CONVENIENT SACK-HOLDER.

FOR the home-made sack-holder shown at Fig. 213, we are indebted to Mr. W. D. Sawyer, Weld Co., Colo., who finds it very useful where there is only one to do the work usually performed by two. The design is original, and infringes on no known patent. It is made of a piece of board, A, 2x8 inches and 30 inches long, and two pieces of scantling 1x2 inches and 42 inches long planed smooth. For half the length of these, holes an inch apart are bored large enough to admit a nail, as seen over C. C. Four pieces, B. B. B. B., of two-inch stuff fasten the uprights C. C. to the board A., 17 inches apart, as shown. Two pieces 1x2 inches, and 10 inches long, and two others 1x2 inches and 4 inches long, are then nailed together so as to leave a hole 1x2 inches in the middle. Into each of these drive two headless wrought nails. Sharpen these and bend them upwards; put these "heads" on the uprights as shown at D., and in each bore a hole to correspond with the holes in the uprights; insert a nail; hang the sack on the nails; and lower or raise the "heads" to suit your convenience or the length of the sack.

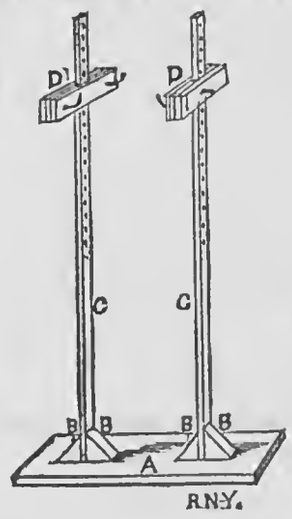

Fig. 213.

TO RAISE A WAGON BOX.

THE arrangement shown at Fig. 219 is in use in a two-story wagon and light tool shed recently built by Mr. G. E. Capel. The shed is 16x20 feet with 10-foot posts. Two wagons stand side by side, and above them can be put away plows, cradles, hoes and other light tools. It frequently happens that it is necessary to change the wagon-box in a great hurry. The hands are all busy and there is no help to be had. In such a case the design shown in our illustration will be valuable. A tarred rope is securely fastened to the joists over both ends of the wagon-box. This rope can be easily passed down in a loop under the end of the box and up through a pulley where it will hang down within reach. A hook is fastened to the end of the rope, which, when the box is pulled up, will just reach to a ring fastened in the rope, into which the hook is placed. When one end has been drawn up, the driver steps to the other end and pulls that up by means of a similar contrivance. When not in use the rope is drawn down, so the loop will be out of the way. No stock will chew the dangling rope, as it is heavily tarred.

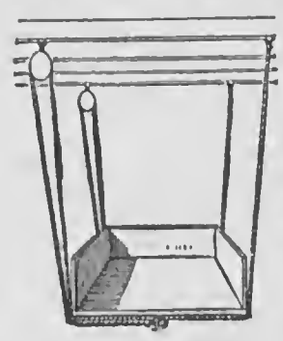

Fig. 219.

A CHEAP CISTERN.

THE "cheap cistern," recommended by our friend George Pettan, Sauk Co., Wis., is shown at Fig. 212. Any handy number of water-tight barrels are arranged alongside of a guttered and spouted building. The spout discharges the rain-water from the roof into the first of these, and when this is nearly full a tin spout conveys the surplus water to the

next barrel, and so on till all are filled. It would be well to have the first barrel a trifle higher than the next, and so on with the

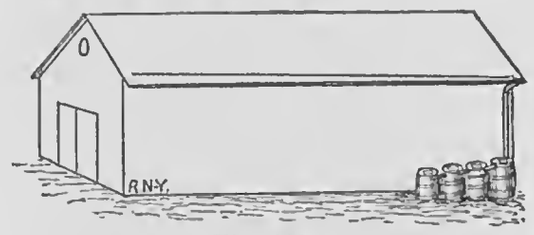

Fig. 212.

others; but as this can be effected by piling earth under the barrels, there is no reason why they should diminish in size, as shown in the cut. Indeed, as water seeks its own level, if the connecting spouts were horizontal, the water would flow along easily from one barrel to the next, as soon as it had reached the level of the spout in the discharging barrel.

What Others Say

MORGAN HORSES.—The Mass. Ploughman is deserving of credit for the accuracy of its short-hand reports of the excellent proceedings of the Farmers' Meetings held in Boston weekly. Some weeks ago John E. Russell, Secretary of the Massachusetts Board of Agriculture, talked about horses. The Morgan was a remarkable family of horses. It was not a breed or a race, but a family. It was descended from one little horse, named Justin Morgan, that was taken by a Vermont creditor for a debt. This horse was taken from West Springfield, or certainly from Hampden County in Massachusetts, where he was bred, into the State of Vermont, and fortunately retained an entire horse, and was the progenitor of that splendid family of horses that we all of us know, and that so many of us remember as the Morgan stock of Vermont, as, indeed, of all New England. That little family of horses brought into the State of Vermont more reputation and more money than any other thing, unless it was the Merino sheep, and probably more than these. Sec. Russell, as a boy, remembers those short-coupled, short-jointed, full-breasted, fine-headed, pointed fox-eared horses, weighing from 950 to 1,000 pounds, rarely more than 15 1-4 hands high, not quite high enough, but of splendid and enduring qualities, with a domesticity of character that he has never seen or known equaled in any family of horses. What has become of them? In the first place, it was a family of horses in which the blood was all in the male line. There was no re-inforcement of anything to keep that family running over two or three generations. The foal from the first cross is one half Morgan. The second cross is ¼; the next, ⅛; the next, 1-16; the next, 1-32; the next, 1-64; the next, 1-128; the next, 1-256 part. Where is your Morgan stock after it has gone through so many changes? Your name is there, but your blood is gone. The blood of any popular sire, where there is nothing but a family and not a race, is gone. We have heard of the old English stock, but we have not got the blood of any original progenitor. It is divided up and lost in the crosses. So it is with the Morgans. The blood has not had any re-inforcement and, therefore, the family never could run beyond a very short time without giving out.

BUSH'S MESSENGER.—Pedigrees in our road horses, when they go back 25 years, are as mystical as the history of the heathen gods. There is a name that has been made much of in the pedigree of horses brought from Maine, viz., "Bush's Messenger." This was a horse owned by Philo Bush, from whom he was named. Bush cared little for road or trotting horses; he was a trainer of thoroughbred race horses, and 20 years ago had charge of the race horses belonging to Mr. Leonard Jerome. He said that the horse called "Bush's Messenger" was named "Messenger" by him, and he had not the least knowledge of the horse's origin, nor a high opinion of his value; yet this horse was for years considered the last repository of the blood of imported Messenger, and his name is a red letter in many of the trotting pedigrees.

PERCHERONS.—Mr. Russell paid a well merited tribute to Mr. M. W. Dunham of Illinois, who has imported from France so many of the Percheron breed. This is one of the most important breeds of horses raised in the known world. They are very much like our Morgan horses of 40 years ago, except that they are two or three sizes larger. They look just as the Morgan horses would if they were of ideal size. They have their quick action that no other family of large horses that he knows of have had. These Percheron horses are of immense utility in farm work. They are of very early maturity. They can be put to work without fear of injury when they are from 18 months to two years old. These horses now bring fair prices and are selling for farm work for from $160 to $200—the horses being four or five years old. Now there is no farmer in Massachusetts, Mr. Russell thinks, who can raise horses and take the risk on one or two colts for any such price as that. He has raised a good many colts, and cannot raise a colt in Massachusetts and pay the interest on the money and the municipal taxes and all the burdens that lie so heavily upon agricultural shoulders, unless he can get from $300 to $500 for a colt when he is four years old. Farmers don't get high prices for anything, but they have to pay high prices, even if they don't get high prices for their own products.

BUYING HORSES.—In buying horses, one of the old troubles of the buyer was that he was liable to buy an old horse. In Mr. Russell's time that was the thing to be guarded against. You were almost certain, in going to market, to be stuck with a horse that somebody had turned off either on account of his temper or age, and did not want him any longer. This is not the case with horses brought here from the West to our farmers for sale. They are young horses almost invariably, and have not lived long enough to have their temper spoiled. That is a very great advantage. In the first place, they are young, because the breeders do not want to pay for keeping any longer than necessary; and in the next place they are sound, because they have been examined once already. Those who have bought them are very careful about running the risk of buying unsound horses and paying the freight here where they are to be sold again; so that you have the advantage of first-class judgment on those horses already on the part of the horse buyer. But there is another thing which you must look out for. You must be sure that you don't get stuck with a young horse—although that is only a temporary defect. Mr. R. has examined horses that were offered for sale in Boston as six years old when they were only three. He has seen splendid animals offered for coupe purposes, for a single heavy carriage, that were actually just coming three years old this Spring. Youth is a defect, however, that is very easily remedied. There is nothing that is so readily cured by time. That applies as well to horses as to boys, and if you give them time they will get over it. Many times have young horses been put to work just at the period when digestion and their whole system are affected by the fact that they must change their set of teeth. For a horse does not get a full set of permanent teeth until he is five years old. Consequently he should never be put to continuous hard labor until he has reached that age.

CARE OF COLTS.—When a colt is born on a farm every farmer ought to know how to treat his mare so as to increase her flow of milk. He should give the colt all the nutrition that is possible, and keep it growing as well as he can while it is still upon the dam's udder. Many of these old mares are poor milkers, and all that can be done is to increase the flow of milk, and that is a matter that all farmers understand thoroughly in dealing with their cows. The same thing that produces a good flow of milk in a cow will produce a good flow in a mare. If the mare is put where the colt can get at the feed, within two or three weeks the colt will be eating freely of bruised oats and sweet hay. Foals should come in April or May, or late in the Fall after fly time. Young things need to grow and to sleep. The flies in one of our summer pastures torment a young foal beyond endurance. There is no more distressing sight than a young foal at pasture in August or September. If a foal is dropped at that time it may be kept with its dam in a loose box or dark stable during daylight, otherwise it will make a poor start in life. There is no pedigree or royal line of equine blood that can stand the torment of flies. It is an old English proverb that half a horse goes down his throat. You must have a good appetite in the animal if you ever expect to have stamina and vigor of constitution. A colt wants to be kept eating and growing and exercising and anything except fattening, as long as he has a time assigned him by Nature to grow. You can starve an old horse. You can turn him out somewhere upon a barren pasture or a rough hill-side to fight the flies in the Summer and battle with the elements, and if you bring him back in the Fall and put him into the barn and give him good keeping, you can get him in good condition again, and Nature will restore the waste and make him a strong horse again. But if you stint a young animal during the growing period of life, you have lost the precious time that will never again come to you. This opportunity lost is never regained. When you have once made a stunted animal, you can never again make the bone and stature that Nature would have allowed if you had given generous feed.

FARMERS SHOULD NOT TRY TO RAISE "TROTTERS."—When the colt is three years old, it occurs to our farmer to see what horsemanship can do for him, and he generally sends him to some local trainer to be broken and "developed for speed." But usually the most practical thing about the trainer is his bill, and his time is the least valuable of anything which he has to give. Usually before the trainer begins the farmer thinks that the colt will be worth about as much as Maud S. or Dexter, but by the time he is through and the bills are paid, he finds that $150 is all he will bring, or $250 at the outside. If a farmer is a sufficient horseman he will give up the idea of breeding that phenomenal creature which is known, not as a horse, but as a trotter. There are two or three kinds of horses. One is a trotter, but that is not merely a horse. It is an animal that has an aptitude to learn a certain trick which is called trotting. It is not natural especially, any more than it is natural for dogs to be born with stumpy tails. If the roads are smooth enough, and if the wagon or sulky is light, and if the weights on the feet are properly adjusted, and if the animal at the other end of the reins has got the right sort of hand and won't give it away to somebody else, the horse may make a phenomenal record. But this is not one of the pursuits of the farm, and any farmer or farmer's boy that links himself in any way with the business has deviated from the true and straight course that belongs to legitimate agriculture or husbandry.

HANDLING THE COLT.—There must be no jerking, no loud words, nothing quick in the movements about the colt, but everything slow in motion. There must be no loud shouting or anything of that sort. The horse has got to be gradually familiarized with the work which he has to do, and his muscular strength must be developed at the same time. With young horses there is no better plan for breaking them than to put them at work before the plow. Mr. Russel thinks that there is no way in which the horse's temper can be better developed than by putting him on the plow when he is about three years old, and teaching him how to be patient of the obstacles that have to be met in that work. That is the way he trains his colts, and they know how to step into the furrow or out of it when they are told, and they recognize "Haw" and "Gee." With this practice they get a splendid training, and it affects the whole after life of the horse. They expect that obstacles will be met when they are in the carriage, and they realize that they are to be quiet. For instance, when the plow strikes stumps, or roots, or stones, and brings everything up suddenly, the young horse, expecting something of that sort, will stand until the trouble is righted and everything starts smoothly again. They will remember this. He would not allow his family to use carriage horses that were not familiar with the plow, and that would not mind "Haw" and "Gee" in the carriage, if necessary. His wife's carriage horses, when they are lightly worked, are occasionally put upon the plow and made to do a few hours' work. The result of this experience is that they are not alarmed at noises behind them and the sudden bringing up at a root or concealed stone; they become more attentive to the voice of the driver, and every way wiser and safer.

EXAGERATING POULTRY PROFITS.—O. S. Bliss says, in the New York Tribune, that a specialist located in a densely populated section of country, in close proximity to numerous manufacturing and commercial cities where every egg and chick he raises is in quick demand at fancy prices, with no commissions, no freights, no breakages or other losses, real or constructive, to be deducted from the account of sales, can unquestionably net $2 per hen from a flock kept for the production of eggs, chickens and fowls, leaving entirely out of question all fancy stock breeding. But when such a man in a meeting of farmers deliberately asserts that "every farm of 70 or 100 acres can carry 100 hens or upwards at a net profit of $2 per hen, the assertion is misleading and harmful. If the average farmer, remote from local retail markets, and compelled to sell his products through the regular channels of trade, as the great majority of them are, can net $1 per hen he does well.

THE NATIONAL SEED DISTRIBUTION.—The city of Washington, says Ben Perley Poore in the Cultivator, is just now a great seed establishment. In the entryway of every hotel and boarding-house where a Congressman lodges, are large mail-bags filled with packages of seeds, each done up in a great quantity of brown paper, and securely tied with strong twine. Go to the room of a Senator or a Representative, and you find whole stacks of these bundles of seeds, varying in size from those which hold several quarts of grain, down to the dainty little package of flower-seeds. These packages are directed to favorite constituents, franked to secure their free transmission through the mails, and strewn broadcast over the land, with the expectation that each one will bear at least one vote. There are grave objections to this free distribution of seeds, Mr. Poore is well aware, especially those of seedsmen, who fancy that their sales are interfered with. But he thinks this is a mistake. Many a man who would not have a vegetable patch or a flower-garden, is economically moved to cultivate the seeds sent him, rather than to have them wasted. It is a pleasant thing for a farmer living almost out of civilization to receive these remembrances from his Senator or Representative at Washington. They cost a good deal of money, he admits, but the seed purchased is mostly grown in this country, the paper and twine are made here, and the poor women and boys who put up the packages are often thereby enabled to keep families from starving.

THE LATEST AND BRIEFEST.

IT seems that M. Pasteur has treated about 800. Of these 38 persons had been bitten by wolves—the others by dogs. Of those bitten by dogs only one died. Three of those bitten by wolves have died of hydrophobia. M. Pasteur is of the opinion that there is no difference in the poison of the mad wolf and mad dog; but the severity of the wolf bite is far greater.....

A WRITER in the American Garden suggests that early peas and tomatoes may well be grown together. The peas may be gathered before the tomatoes have made much growth.

MR. PARKER believes that by spraying apple trees with London-purple, they may be rid of the codling moth and the "whole crowd of insects" that infest them. He prefers London-purple to Paris-green because it is much cheaper and because it does not settle in water, needing one person to stir it as one drives along with the force-pump. Mr. Rathbone who has experimented a good deal finds that half a pound of the purple to 60 gallons of water is plenty. The purple should be wet, forming a paste, before putting it in the barrel. Then it will mix readily and not float on the water.....

THE Farm Journal wants farmers' wives to strike for fewer hours of labor and better pay. Good! If they would boycott the dinner table a few times, there would be a sudden call for an "arbitration meeting."....

A COUNTRY Gentleman writer tried the experiment of hauling manure from the barn-yard in Winter, and placing it in heaps on a steep hillside to see how much of the value would be washed out of it by rains. The result was that the increased growth of the grass from the washing did not extend five feet below the heaps. The winter spreading of manure has given excellent satisfaction with us—but our land is level.....

L. F. ALLEN finds a dairy cow quite to his satisfaction in a cross-bred Guernsey, the progeny of a Guernsey bull and a Shorthorn cow. Such animals are of good size and flesh, and gentle and kind. Their yield of milk is continuous and the percentage of cream is quite equal to that of the Jersey.....

MR. JOSEPH HARRIS wants to know why it is necessary to make the land so rich for onions, and, also, why early sowing is absolutely essential to success? Mr. E. S. Goff answers, in the American Garden, that the roots of the onion occupy far less space in the soil than those of any other vegetable. The roots take complete possession of the soil beneath them, forming a circle about eight inches in diameter and for a depth of but 10 inches. Hence it is that the soil *must* be rich. Hence it is that we may grow them so closely together. Hence it is that early sowing is necessary. The roots must be made before the summer drought occurs.....

JAMES RANKIN says breeding for the Standard is one thing and breeding for the market is another and quite a different thing. Many of the "points" so-called, required by the Standard are worthless when breeding for the market.....

HE might use as an illustration the feathers on the second toe of the Light Brahma, or the black tail of the Wyandotte.....

HE says a cross between a Plymouth Rock cock and a Light Brahma hen produces the best chickens for the early market, giving early maturity with plump bodies and meat of excellent quality.....

HE has not, however, been able to successfully perpetuate the cross, as the produce deteriorates rapidly, and a large proportion of the eggs prove infertile.....

PHILANDER WILLIAMS says that one breed of poultry is about all any man can success

fully breed. Other varieties may be tried as an experiment, but a man must become identified with a breed before he can secure the confidence of purchasers and obtain fanciers' prices.....

He says it is usually more satisfactory to sell chickens or fowls, than eggs.....

Prof. Shelton says that while most of the students at the Kansas Agricultural College are sons of farmers, many of them get their first lesson in hauling manure a-field on the College farm. The Kansas College is doing good work. The students will take the lessons they have learned home with them. The value of the education will show on the farms of Kansas.....

R. M. Littler, the Secretary of the National Butter Cheese and Egg Association, says that farmers who do not cast their ballots in accordance with their own wishes, and for the promotion of their own welfare, have no business to be free men.....

The Farm Implement News says that a sharp knife in a mowing machine saves time, team, labor and temper. Right, successful hay-making begins with good tools.....

The Western Rural thinks many men are handicapped with accomplishments. Their step is too delicate; their touch too soft; their boots too polished and their gloves too fine. These are not the kind of men who have aided civilization.....

Sprinkling eggs in the nest during incubation is often recommended, but it is immeasurably better to thoroughly wet them by dipping. Mr. Bliss's practice for several years has been to wet all the eggs about the 19th or 20th day. If the hen be taken from the nest so that the eggs are in full heat, which is much better than to take the eggs after the hen has gone off and they have become partially cooled, the water should be at a temperature of 100° F. If they are cooled the water should be tempered accordingly, so as not to suddenly heat up the shells. The eggs at this stage will endure considerable change of temperature if it is not too rapid, but it is better to avoid it altogether.....

Experiments made at the Massachusetts Agricultural College to ascertain what distance apart corn should be planted, the variety being a medium-sized, early, yellow dent, show that rows three feet eight inches apart and 11¾ inches apart in the row, yielded the most. The next heaviest yield was from 13 inches, the lightest from 15½ inches, which was the lightest stand.....

The straw of the Welcome Oats was weak, that of White Russian stiff. We doubt if the oats were true to name. At the Rural Farm, the straw of the Welcome is fully as strong as that of the Russian.....

In another series of experiments, 19 inches apart in the row, the rows being the same, gave the lowest yield, and 13 inches gave the greatest. The best yields may be said to have been obtained from one foot apart in the row.

A hot-bed heated with a home-made coal furnace was constructed last Fall at the Michigan Agricultural College. This has worked well. Prof. Bailey thinks it will prove to be a cheaper hot-bed than the manure beds in common use.....

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

Cornwall, Ont.—The season is more advanced than ever before known in this section of Canada—fully three weeks ahead of the average. Trees are just coming into leaf, and the weather is mild and genial. Wheat, as a rule, has wintered well, and the farmers are well on with their spring work. Sugar-making is an extensive industry, and the quantity and quality of the product is unusually good this year. Maple sirup sells readily for $1 a gallon, and many farmers make several hundred gallons. Y.

Connecticut.

South Glastonbury, Hartford Co., April 19.—We are having a very favorable Spring here, and the season is about two weeks earlier than last year. J. H. H.

Dakota.

Mandan, Morton Co., April 30.—Last Summer hail destroyed all our crops. The weather has been very cold since April 25, the ground on two mornings being frozen an inch deep. Farmers are about through seeding. There is a large acreage of grain. Wheat looks first-rate. I picked the first prairie flowers to-day on land that was burned over last year. G. W. G.

Illinois.

Leaf River, Ogle Co., April 29.—General farm work began April 12. We had weather hot enough for June the first few days, but it is cooler now. The frequent spring rains have delayed the getting in of crops. No corn will be planted for a week. Grass is growing nicely. Farmers in general have had bad luck with young pigs, having lost 40 per cent. This is our year for fruit. D. E. K.

Marion Co., April 26.—Last year's strawberry crop was too large for the demand. We all as fruit growers lost money. The vines for the coming crop are looking well at present, and are covered with blooms, and prospects are grand for an abundant crop this year. T. H. McC.

Louisiana.

Pottarville, East Baton Rouge, April 27.—Crop prospects for this section are gloomy. The cross-roads store loafers (who are such only on rainy days) declare this season to be the most backward of any within their remembrance. The excessive and long-continued cold weather, with the superabundance of rain, has delayed planting, and crops generally are from three to four weeks late. Very little oats passed the Winter in safety, and few planters put any in this Spring. Corn is just being worked the first time; usually it is from three to five feet high at this season. Cotton seed is scarce, and planters are buying from the oil mills, as a great deal of land has to be entirely replanted. Plant cane looks well on the highlands, but the stubble was mostly killed. Early potatoes looking well. Last night a heavy hail-storm passed over this section, leveling fences and blowing trees down. The hail ruined garden vegetables, breaking tomato vines, cabbages, beans, peas, etc. The cotton which was up suffered severely, but it will be several days before we can find out whether replanting will be necessary. Corn and potato vines were riddled. R. G. B.

New Jersey.

Hightstown, Mercer Co., May 1.—Wheat and grass look better than at this time last year. Peaches look well: one-third killed. Cherries killed very badly indeed—over one-half. Prospect for all other kinds of fruit fair. Prices low: wheat, 95; corn, 45; oats, 40; butter, 25; eggs, 12; potatoes, 70 cents per bushel. J. S. B.

New York.

Apalachin, Tioga Co., April 27.—The warm weather of the past two weeks has brought vegetation forward rapidly; there is need of rain at present. Wheat looking fair, with the exception of some places which were winter-killed in spots. Oat seeding about over—about the usual area. Potato ground is being fitted as rapidly as convenient. Dakota Reds, Burbanks and White Stars are the principal varieties that will be planted. Potatoes selling at 35 to 40; oats, 28; wheat, $1; veal calves, 4 to 5 cents alive; butter, 20 cents; eggs, 12 cents; other things in proportion. C. F. G.

Sharon Centre, Schoharie Co., April 30.—The weather has been unusually fine for the last half of April. Sowing is very nearly all done, although we expected grass to be badly winter-killed, we have never had as good a growth in April as now. Clover sown last year looks very fair. I have 16 acres that would make very fine feed now. Fruit and forest trees are leafing out very fast. Plum and cherry trees in blossom in April have hitherto been unheard of in old Schoharie; but we have them now. Should we have a late frost, much injury will follow. This is a great hop section and a great many vines have been killed by the open Winter. A good many will be plowed up. Some whole yards were killed; those that are alive are very uneven, some large enough to tie, while others have not started; poor prospects for a crop. S. L.

Union Spring, Cayuga Co., April 24.—Wheat, grass and clover are looking very good. Farmers are busy plowing and fitting ground for barley, of which a great deal is raised in this county. We have had very good spring weather for two weeks; vegetation is two weeks in advance of last year. O. L. C.

North Carolina.

Shore, Yadkin Co., April 24.—We have a grand prospect for fruits in most parts of the State. Peach buds were killed in a few low places; but in general a good crop is expected. N. W. C.

Ohio.

Mt. Blanchard, Hancock Co., May 1.—Rural New-Yorker, Stratagem and Prince of Wales Peas are now up. They are excellent. The Flageolet Beans are the best we have ever tasted, and are as good in Winter as in Fall. Very few farmers hereabouts value a hot-bed. My lettuce is ready for use, while most of my neighbors are just sowing their seed. My first ripe tomatoes of the Rural's seed were picked on July 14 last year. The Plymouth Rocks are my favorite hens for a small flock, though I mean to try the Wyandottes. Weather beautiful. Spring work never so well advanced. Fruit prospects could not be better. Pasture already good. J. S.

Shreve, Wayne Co., April 28.—Times hard. April was snowy, muddy and disagreeable up to the middle; since then like Summer. Vegetation is coming forward faster than I ever knew it to come at this season. Fruit prospects good. I never knew mosquitoes so numerous in this month before. H. M.

Texas.

Evant, Coryell Co., April 16.—Farmers are up with their work; only about half as much land under wheat as last year, and what was planted was partially frozen out during Winter; but what came through looks fine. Oats a large area and looking fine. Early planted corn froze out in the latter part of March; corn generally up. Cotton planting is the order of the day. The peach crop was thinned out by the late freezes, and in some places completely ruined. Prices, corn, 40 cents per bushel; wheat, 75 cents; oats, 25 cents. In spite of the freeze at the end of March, the R. N.-Y. Peas are now loaded with bloom and young peas. Pulaski Peas planted March 10 are now in bloom. G. J. B.

Houston, Harris County.—Corn about two feet high and in bloom; rather small; good strong stalks. Crop prospects good. Our market is well supplied with new Irish potatoes, cucumbers, dewberries, strawberries, peas, snap beans, cabbages and everything in the vegetable line at very low prices. Cotton, corn and sugar-cane look well. A great many cattle died last Winter. Of Short-horns I lost 15 head. They won't do for this country. Success to the Rural! T. B.

Vermont.

Bakersfield, Franklin Co., April 29.—Weather cool and dry; no rain for two weeks. Farmers busy putting in crops. Sugar season short—about two-thirds of a crop. Sugar is worth from 5 to 7 cents. Potatoes plentiful at 50 cents; butter, 18 to 20 cents; wheat, $1; oats, 50 cents; hay, $12 to $15 per ton; cows, $30 to $35 apiece. M. S.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a seperate piece of paper.]

SILAGE FOR FATTENING CATTLE, ETC.

L. M. L., Cortland, N. Y.—Would it be a good investment to build a silo and fill it with silage for fattening cattle through the Winter? Just before Winter most farmers have heifers which they wish to stable instead of inferior dairy animals, such as farrow cows, light milkers and old scrubs. They haven't room for all, and at weeding time the Bologna sausage man alone wants to buy, so that prices are very low, and many a young cow in fair condition goes at "scrub" prices, because she is not wanted in the dairy, and the dairyman as a rule, does not raise much grain and cannot fatten her profitably, buying the grain to do so. I have this Spring seen cows fat enough to butcher, that have been fed on silage and milked all Winter and were coming in, and the owners said they had had very little grain; now if silage increases the flow of milk and fattens breeding cows, ought it not to fatten a steer or dry cow very fast?

Ans.—The feeding of cattle for the market upon farms is necessarily becoming a most important matter for farmers to consider, and the methods of growing feed and of feeding deserve careful study. As regards the questions put by our friend, we have to say that silage is an excellent food under special circumstances; that nothing is gained in the process in the feeding value of the fodder; but that some loss occurs through the fermentation. This loss, however, is reimbursed by the more palatable and digestible condition of the fodder when ensiloed. Corn fodder so prepared is therefore a better winter feed for fattening cattle than dry corn-stalks; but it is not so nutritious as hay. But again, this difference against the fodder vanishes when it is known that 20 tons of green, succulent feed, equivalent to five tons of hay, can be grown upon an acre of land which would not produce more than two tons of hay. As 80 pounds of silage per day will fully feed a fattening steer with a proper allowance of grain, the 20 tons grown upon an acre would feed a herd of cattle for five months, and there is no doubt that the cattle would do better on this ration than on an equivalent quantity—20 pounds—of hay. No more grain would be required to be fed with silage than with hay; eight pounds of corn meal and two pounds of cotton-seed meal would be sufficient for a medium-sized—a 1,500-pound—animal. The succulent condition of the fodder would tend to make the digestion of the meal easier and more complete and the animal would therefore gain more on such feeding than on wholly dry fodder. This effect of succulent food is well known in regard to the value of roots for winter feeding, the results attained being more favorable when these are given along with the dry hay and meal. The manure question as connected with feeding fattening animals, is one of the highest importance, as it relates to the enrichment of the land under this system of winter feeding. Straw and all other kinds of fodder can be used for feed, and all sorts of absorbents that can be gathered may be made available in place of the straw. Swamp muck dried and forest leaves are the most valuable: hardwood sawdust is next in value; but from an extended experience with soft-wood sawdust we should decidedly caution farmers against its use. It is too dry and heats freely, and although it might serve for cattle fed on succulent food, better than for horses, yet it contains so little fertilizing matter and decays so slowly that anything else, even sand, would be preferable. The profit of feeding cattle is at present quite small; but the indirect profit in the shape of manure is always sufficient to pay the farmer for the labor, while the fodder and grain, although this latter may be purchased, are repaid for at better prices than they could be sold for in the market. The profit made, however, is always in proportion to the skill employed in the feeding and in the economical management all through the business, the buying and selling being done with judgment so that losses are not made.

NORTHERN FRUITS IN THE SOUTH.

W. A. J., Long Island City, N. Y.—Will fruit trees grown in Northern nurseries, change seasons when planted in the South—say in Southern Virginia?

Ans.—There is little objection, save that of distance, to the use of Northern grown trees for planting at the South; or *vice versa*. It is true, however, that the later varieties (more especially of apples and pears) are increased in size, and mature early as they go southward. This is not found to be an objection, in the case of early or summer varieties, since increased earliness is the object sought. Such apples as Baldwin and Rhode Island Greening, however, while they are increased in size at the South, lose both in quality and season, becoming fall apples, while fall apples mature in Summer: Baldwin and Rhode Island Greening are found to be of little value south of central Pennsylvania and Ohio. Northern peaches succeed perfectly at the South—merely maturing earlier. Cherries do not generally succeed at the South, and may be expected to be only moderately successful in Southern Virginia; although in a cool situation—say a Northern exposure—with suitable soil, and only moderate annual growth, they will probably give satisfaction.

MYROBOLAN STOCKS FOR PLUMS.

G. S., Ontario, Oregon.—My neighbors and myself have bought fruit trees from a traveling agent for a Walla Walla nursery firm. We were told that they had been grafted on Merrablin roots, imported from France, and we were charged $1.50 extra for each root. Is there such a root; and were we swindled?

Ans.—There is, so far as we know, no stock of this name used in the propagation of fruit trees. The similarity of names, however, induces the suspicion that the fruit trees referred to may be plum trees, which are sometimes worked on the Myrobolan or Cherry plum, (Prunus cerasifera) a native of North America, sometimes employed as a stock for the purpose of dwarfing the plum. These stocks are sometimes imported from France to be used as stocks for the Garden plum, (P. domestica).

PIGS AND SMALL FRUIT FARMING.

W. A. P., Rockport, Ohio.—1. Is it practical for a small fruit farmer to buy and fatten pigs profitably, applying the manure to his fruit plantation? 2. If he has but little milk, of what age should the pigs be when he buys them? 3. Is it possible to make a floor of matched boards, that will save all the liquid manure in the pig-pen?

Ans.—1. To a limited extent, so that the milk, swill, weeds and refuse fruit and vegetables will make the greater part of the feed. 2. He should buy shotes or pigs three months old, as such pigs would do well with little milk and wheat middlings with coarser food. Matched plank will make a tight floor, and the liquid will run into the manure in the rear of the pen and may be absorbed with earth, muck or any dry substance thrown on the manure or put into the pen. In warm weather the pen must be cleaned every day. The floor should slant to the outside.

TANNING SMALL SKINS.

Several Subscribers.—To tan small skins, lay them down, flesh side up, and remove all pieces of flesh with a sharp knife. If not fresh, soak in moderately salt water until soft. Apply a mixture composed of equal parts of salt and alum, made very fine and saturated with a fluid composed of two parts of water to one of muriatic acid. Double the edges of the skin all around till they meet, and then roll up as compactly as possible and place in a cold place. If at the end of 24 hours, any portion of the dressing has disappeared, apply more and re-roll. At the end of two days, stretch the skin on a table or other flat surface, and with stones or sharp brick rub it until dry. Apply thick soap-suds into which cotton-seed oil has been placed; again rub till dry. Repeat the soap and oil emulsion and rubbing until the skin is sufficiently pliable.

EFFECTS OF MAGNESIA ON THE SOIL.

W. H. S., Providence, R. I.—I can obtain wood ashes in which burnt magnesia is largely present as a waste product; what effect would its application have on land?

ANS.—Magnesia is similar to lime in its influence on soil, but less active. The decompositions and transformations of the compound silicates and its action on the inert humus of the soil will be of the same nature as those produced by lime, but less energetic. The mixture of wood ashes and magnesia will be beneficial to most soils, especially to open, sandy soils where potash and phosphate of lime are deficient. The more wood ashes in the mixture the better for the crops.

Miscellaneous.

H. R. H., Farmville, Va.—Sumac seeds can be obtained from Thorburn & Co., New York, costing $1.50 per pound. We do not think the cultivation of sumac will be profitable unless one is so situated that he can make a business of it. Unless one is near a market and has facilities for gathering, drying, baling, etc., etc., the crop can hardly be made to pay. Most of the sumac used in this country is imported, chiefly from Sicily. Of the domestic product, more is gathered in Virginia than in any other State, the headquarters of the industry being at Richmond.

F. E. S., Cañon City, Colo.—1. The peach tree bears fruit only on the young shoots of the current year's growth. Raspberries generally bear fruit on the last year's canes. Some kinds bear also on the canes of the current year's growth, as Belle de Fontenay, everbearing caps, etc. Grapes bear fruit on the shoots which issue from the last year's wood. 2. The Leghorn, we think, lays the largest egg, size of fowl being considered. We do not know as to the yelk.

J. W. S., Melvern, Kans.—Among the small fruits adapted to a high and dry, light, gravelly soil, the best of strawberries are: Downing, Crescent, Cumberland and Sharpless; also try Jewell, Parry and May King. Raspberries: Cuthbert, Shaffer, Turner, Caroline, Earhart and Ohio. Blackberries: Kittatinny, Early Harvest and Snyder. Currants: Fay's Prolific and White Grape. Gooseberries: Downing, Houghton; try Industry.

R. M., Galena, Ills.—The mushroom has no visible seeds, but there is little doubt that it seeds as all other vegetation does, and that its seeds are what are known as spores. What we see of the growth of the mushroom is a thread-like substance called "spawn;" but we think that is only a secondary condition from the development of the spores or seed. There is no way in which mushrooms can be propagated by cuttings or anything of that kind.

W. H. J., Argentine, Mich.—Cuttings of the "common privet," mentioned as desirable for a hedge plant in a late RURAL, should be found at any well-established nursery. Price about $2.50 per hundred. The seeds are offered by Thorburn & Co. of this city at $1.50 per pound.

W. D. C., Foxboro, Mass.—Kerosene and lard oil for ticks on sheep should be in a mixture of equal parts. Rub well in with a cloth or sponge, or open the wool here and there, and pour from a can.

S. J. M., Reading, Mich.—For "yellows" (rust) in raspberries, there is no better remedy than to cut out the affected canes and burn them.

DISCUSSION.

C. H. H. ST. ALBANS VT.—In the F. C. of the RURAL of April 17th, an inquirer asks what should be done for a cow that had been falling off in flesh for six weeks, and which was troubled with "wolf-in-the-tail." The answer intimates that the cow doesn't get enough of suitable food to eat; and the inquirer was told to feed her liberally. Now, I don't consider this any answer at all. The cow could be cured by putting a tablespoonful of camphor in each ear. A cow of mine in the same condition was cured by this treatment. She suddenly ceased to eat, became sick and gave little milk, finally giving none at all. Several of my neighbors, good farmers, advised the above treatment, and although I thought it too severe, I followed the advice, and the camphor proved just the thing for her. She milked freely after a few days, and is now all right. I had bored her horns a few days before using the camphor, but I believe the latter caused the cure.

R. N.-Y.—An old "saw" accounts for much credulity in this world—*post hoc, ergo propter hoc*—after this, therefore on account of this. Because one occurrence or condition follows another, it is often considered the result of the other; whereas, in reality, there may be no more connection between the two than there is between the early crowing of one's neighbor's cock, and the nature of one's own breakfast; or between the discovery of the new comet in Cascopeia, and last Tuesday's bloody riots in Chicago, a week afterwards. It is this semi-superstitious and wholly credulous tendency of many to look upon an antecedent occurrence as the cause of a subsequent one with which it may have no causative relation, that induces many people to believe in dreams, many others to pin their faith on worthless medicinal nostrums, and still others to think the best remedy for an empty stomach or a softened tail in a cow, is to pour camphor into her ears, or bore holes in her horns. Dreams and events are occurring so constantly, that it would be passing strange if an event didn't sometimes occur after a dream which might readily be imagined by a superstitious person a forecast of it. Diseases and ailments are constantly disappearing from natural causes, as the morbid secretions or other deleterious conditions that cause them pass off in due course without medical treatment; but if any nostrum however worthless is taken, or any treatment however foolish or objectionable, is given shortly before the disappearance of the ailment, the "cure" is at once attributed to the medication, although it may occur not *because*, but *in spite of it*. The thousands of dreams that never foretell anything, the hundreds of doses and boluses that never do a shadow of good; the multitude of "remedies" that torture the dumb creation, aggravating instead of healing their ailments, are all forgotten, while the single supposed verification of a dream; or the single supposed instance of the efficacy of a nostrum or of a particular mode of treatment is remembered and bruited abroad, strengthening the credulity and gullibility of many, and constantly creating fresh dupes. In the present case, the symptoms strongly indicated malnutrition of the cow; and if the treatment prescribed has been followed, it is likely the animal has fully recovered by this time.

J. B., GUINEY'S, VA.—In a late RURAL a correspondent proposes that some one should "hunt the whole earth for a grass to reclaim North Carolina and Virginia." The grass to do this is here now, and is known as Wire Grass by people generally who regard it as a great curse to corn, wheat and tobacco growers. The much-abused Wire Grass of this section is, however, the Bermuda Grass of the Gulf States. Knowing the merits of the grass from some years' residence in Mississippi, after settling here I planted some, much to the amazement of my neighbors, and last May shipped to Richmond a cow that had been wintered, without shelter, in a field of this grass, with corn-stalks, and the butcher said she made the fattest beef he had ever seen. I have now another cow, a three-year-old heifer, a two-year-old and a yearling that have been wintered in a field of this grass with an addition of only top fodder and straw, and they are very fat and in prime condition. With hay in the barn and this grass in the field, I expect to be able to turn off export cattle without grain every month in the year, judging from my experience with the stock on hand, which do not belong to any of the beef breeds. My son who has been in New Zealand does not care for any New Zealand grasses here, as we have better kinds already.

R. N.-R.—The identity of the Wire Grass of Virginia with the Bermuda Grass of the more Southern States has long been known. Over 40 years ago, Randall, in his Sheep Husbandry in the South, spoke highly of it, and within the last decade it has been frequently commended in the RURAL under both names, attention being called to their identity whenever the more local name "Wire Grass" was used.

A. L. C., DORCHESTER CO., Md.—I think Mr. Minch, and T. T. L, are both right in their way in what they say of the yellows in peaches in a late RURAL. If a tree is so far gone with the yellows that the pit in the stone is shriveled, it will probably produce a diseased tree; but if the disease has advanced far enough, the seed apparently receives no nourishment, and has not sufficient vitality to germinate. The apparently healthy tree from which T. T. L., got his seed, was really badly affected, the disease showing itself principally in the seed, as I think it will sometimes do. I have often noticed that in opening a free-stone peach, the stone will open with the peach, and the pit is generally shriveled. Such seed would be apt to produce "yellowed" seedlings, and the trees from which such seed are gathered will be likely to show unmistakable evidence of yellows next year. I don't believe much in the contagiousness of the yellows, having pruned diseased trees and then healthy ones with the same knife, and seen no ill effects.

O. H. A., CHARLOTTE, VT.—Having heard that Pringle's Hulless and the Chinese Hulless Oats were the same, I tested them side by side two years ago, and found Pringle's to be distinct from the other. The kernels were a trifle larger, and the straw grew up nearly twice as high. Dr. Sturtevant writes me that he isn't sure that the seed planted at the New York Experiment Station was Pringle's. In a late RURAL the Chinese and Pringle's were declared to be identical on the authority of a report made by an employé of that station.

R. N.-Y.—As has already twice been stated in these columns, we sowed Pringle's Hulless Oats when first announced, and could see no essential difference between them and the old Chinese Hulless.

S. D. W.—Has anybody tried the following plan of "handling" celery to prepare it for winter-quarters? In October gather the stems and foliage, and place around the same an open wire link to hold them as gathered. If the plan is good, the links can be made rapidly by winding small annealed fence wire round a windlass similar to well rope, and then cutting the wire into rings with a cold chisel while wrapped on the windlass, cutting against a bar of iron imbedded longitudinally in the latter. The rings of annealed wire can readily be opened a little for larger plants, or closed considerably for small ones, and once made would last a lifetime.

G. W. S., OHIO.—Some time ago the RURAL made some inquiries about Xanthoceras sorbifolia. I consider it one of the most valuable and handsome early spring-flowering shrubs. Although the past Winter afforded a severe test of hardiness, it came through uninjured in wood or bud.

R. N.-Y.—The RURAL has three seedlings growing, from seed sent us by Mr. Wm. Falconer. They germinate very freely.

C. M. H., BOSTON, MASS.—A late RURAL gave an account of our friend Col. Wilder's azalea, 24 feet around and seven feet high. At the same exhibition I had the original plant of my seedling azalea, Suzette Hovey, which was 27 feet in circumference and eight feet high, raised in 1840, probably the largest and most profusely flowered azalea ever exhibited in this city.

C. C. S.—Lime at eight cents per bushel will be a cheap fertilizer for the purpose mentioned. Apply the hen manure in the hill or drill with a slight covering of earth, and scatter the ashes on the surface to be cultivated in.

A CORRECTION.—In the RURAL of April 24, C. P., Kirkville, Mo., speaking of the Earhart Raspberry, said: "It is stated that 16 gallons of berries were picked about Sept. 1, from two rows six or eight rods long, in this neighborhood." And from his own experience with other varieties, he thought this statement a great exaggeration. Many, doubtless, like ourselves, agreed with him; but he now writes us that he had 16 *quarts* in mind, and that the word *gallons* was "a slip of the pen." Fortunately he had taken a copy of the letter, so that, contrary to the usual custom, even he acknowledges that in this case the poor "printer," who has generally to shoulder all such blunders, was not in fault.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

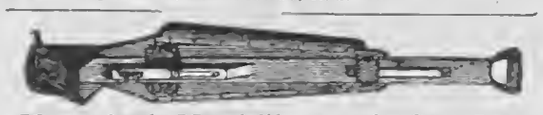
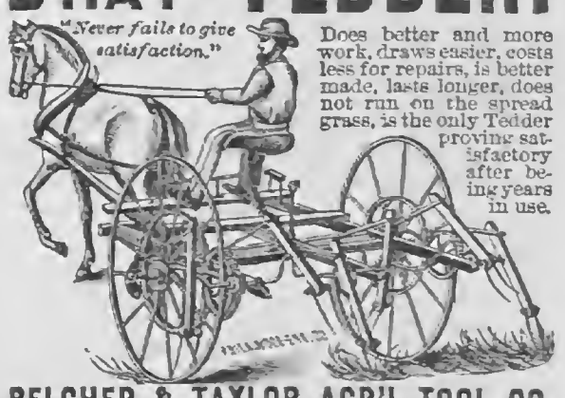
TO FARMERS. This simple invention is used in milking cows, particularly where there is any soreness. Made of solid silver, and sent by mail to any address on receipt of the price, 50 cts. Address The Milking Tube Co., 102 Friendship Street, Providence, R. I.



Macomber's Hand Planter, *for Corn, Beans, and Beet Seed.* The BEST in the world. Money refunded if it does not prove satisfactory, after a fair trial. Agents wanted. Send for circular and terms.
S. M. Macomber & Co., M'f'g's, Grand Isle Vt.
For Rhode Island address L. G. SHERMAN & CO., PROVIDENCE.

IF YOU suffer from "blood taint" in any of its three stages, whether "primary," "secondary" or "tertiary," that produces such horrible ravages, and results in cancerous humors, sloughing sores, and communicates its effects to the innocent and helpless, do not have yourself treated by the old methods, and by those who will fill your system with mineral poisons, which invariably leave their effects, the remedy ofttimes being as bad as the disease, but give yourself thorough treatment, with that high grade, standard blood alterative and specific; Warner's safe cure, the best known, best reputed medicine for kidney, liver and blood disorders in the world, always safe and always sure.

BULLARD'S HAY-TEDDER!



Does better and more work, draws easier, costs less for repairs, is better made, lasts longer, does not run on the spread grass, is the only Tedder proving satisfactory after being years in use.

Faith Increasing.

BUFFALO, N. Y., Sept. 22, 1885.—Some time ago, I had a patient suffering from Bright's disease. Urine nearly half albumen, with casts. Used all the regular remedies. Of no avail. Began to give Warner's safe cure, but had little faith. First bottle, patient began to improve, and after half a dozen bottles was entirely cured of kidney trouble. Have since prescribed it in many instances with success.—J. D. A. POHLE, M. D., 739 Michigan Street.

WE WANT ACTIVE AGENTS
TO SELL THE
Renner Combined Alarm and Door Bell
In every County in the United States and Canada. Geo. C. Owens, Modesta, Cal., says: "I have canvassed one day and took 22 orders." In same letter he ordered two gross. Wm. McKim, of Grand Haven, Mich., says "he took 13 orders in 10 hours." Profit on Bell, $2.50. In our EXTRAORDINARY OFFER to Agents we agree to take back all Bells unsold if the Agent fails to clear $125 in 30 days. Illustrated Circulars sent free. Address
RENNER MANUF'ING CO., Pittsburg, Pa.

Lifts 20 to 50 tons worked by 2 men; 5 sizes. Price, $35 to $70. Stands on runners. Circulars free. H. L. Bennett, Westerville, Ohio.

SATURDAY, MAY 15, 1886.

Our Parker Earle Strawberry plants are variegated. Is that as it should be?

Eight Japan Chestnuts were received May 3 from the Storrs, Harrison Co., of Painesville, O., which weighed exactly 11¼ ounces.

If the number on your address label is 1894, your subscription expires with this number; if 1895, next week; 1896, in two weeks, etc.

This season we are trying the effects of excessive nitrogen applications upon potatoes. We are also trying the effects (for the second time) of all sorts of chemical fertilizers, separately and in every combination.

North, South, East and West the Rural's method of corn culture is gaining advocates—drill planting, level and shallow cultivation, and spreading the fertilizer or manure near the surface.

Now, after two weeks of sunny skies, a gentle shower comes to help on the oats, the early corn, the wheat, the peas, the potatoes, the grass. It is an early Spring, and the country is *so* beautiful that we are sorry indeed for the poor people that are confined to the monotonous, prison-like life of the city.

If one desires to sicken of strawberries, let him purchase those that come from the South in April. If one wants to dull his appetite for sweet corn, let him plant the *earliest* varieties. The earliest sweet peas are insipid as compared with some of the wrinkled kinds which come in only two or three days later. The earliest tomato is good for nothing. We might extend the list somewhat.

The "Mikado" is to be prized as an ornamental tree It is now (May 4) covered with its large white blossoms 1¼ inch in diameter, while those of other pears will average scarcely one inch. The leaves, too, are twice as large as other pear leaves, and more glossy. The fruit was illustrated in the R. N.-Y. last year. Except for canning it is worthless.

Turbulent agitators who set the laws of the country at defiance deserve no pity or favor. The foreign anarchists who, after receiving here chances of advancement they could never have met with at home, try to put their insane political and social theories into practice among us at the cost of blood and conflagration, must be promptly and pitilessly suppressed. As turbulent mobs, their treatment should be short, sharp, and decisive; as individual lawbreakers, their punishment should be prompt and severe.

Referring to Dr. Lawes's article on page 320, "The Source of Nitrogen in Corn," we may be excused for again referring to our experiment which, two years in succession, gave us nearly twice as much corn (grain) on plots which received potash, phosphate *and* nitrogen as on those which received *only* the potash and phosphate. All similar experiments with potatoes made on the same poor land, give substantially the same result. We can't grow crops on this field without complete fertilizers. If the corn plant gets its nitrogen from the air, potash and phosphoric acid should suffice at the roots.

We are sorry to see the statement "going the rounds" that tomatoes from seeds sown in the open ground will give ripe fruit as soon as the plants raised in the house or in frames. It is true that when the plants are grown too thickly and are not transplanted, they become feeble, yellow and "drawn," and when planted out require two or three weeks to recover strength enough to start into vigorous growth. But if not crowded too closely in the seed-bed, and if they are started early enough to be transplanted once by the middle of April, they will form strong, healthy plants with ample roots, and will give fruit a month before those raised in the open ground.

Master Luce, of the Michigan State Grange, has appointed June 10 for Children's Day. The day will be generally observed throughout the State by all Granges. For one day in the year the children will be masters of the situation. They will be seated first at the table, and as far as possible be aided to take the place of the older people in arranging and carrying out the entertainment. In fact the older people will appear as spectators, and try to crowd themselves into the places usually occupied by the boys and girls. This plan is a good one. It will surely interest the children in the useful work of the Grange, and teach them lessons in dignity and importance. We believe in giving the boys and girls a fair chance. The children of to-day are to make the history of to-morrow. Train them well for the work.

The Lower House of Congress has called on the Commissioner of Agriculture for information "as to the amount of wheat and corn on hand in this country, where it is located, the number of acres of winter and spring wheat now in the ground, the amount likely to be required for exportation, and other information on the subject." We are glad the House takes interest in such matters. The information will be valuable, and nobody is in a better position to collect it than the Commissioner. Much of the information sought is given in the monthly reports; but this special demand is likely to cause extra effort and secure more detailed and trustworthy information. Some see the fine hand of speculation in the matter; but why shouldn't Congress be honestly interested in the greatest industry in the nation—the one that imparts animation and life itself to all the others?

A respected friend who justly assumes that the R. N. Y. approves in the main of the new fruit nomenclature, remonstrates that, without protest, we should have deseribed and illustrated an apple with the preposterous name of "Grandfather Smith's Favorite." Our friend is quite right, and we thank him for calling attention to the oversight.

Several years ago the Rural expressed its opinion very positively as to the changes which the new nomenclature proposed, and we have no wish to alter that opinion. There is something which violates one's sense of the appropriateness of things when one is obliged to hear or to utter the coarse, absurd names which many fruits, both old and new, have received. We would not restrict the names of fruits to a single word by any means, providing the names were free from such objections, and especially if they were such as to aid in impressing them upon the memory or indicated some striking peculiarity. Otherwise, the shorter the name the better. But these little matters will regulate themselves. The main thing is to purify and reform our fruit nomenclature.

SPECIAL.

Those who, having applied for the Rural's present seed distribution prior to May 8th, have not yet received it, will kindly notify us by postal at once.

May 13 has been decided upon as a "field day" for the discussion of the Agricultural Committee's oleomargerine bill in the House of Representatives. The several bills on the subject were referred for legal consideration to the Judiciary Committee of the House, supposed to embrace some of the brightest legal lights of that body. In its report, just made, while it concedes that Congress has the right to tax oleomargarine for revenue purposes, it objects to such legislation and declares that the evils arising from its manufacture and sale must be remedied, not by Congress, but by the States.

The product has obtained its present sale by fraudulent misrepresentation. Supervision of its manufacture, as an uncolored product, by the General Government is the only way to prevent a continuance of this fraudulent practice. Such supervision must entail expense which should be paid by the manufacturers. For this reason, and to put it on an equal footing with the product it has for years been dishonestly injuring, it should be taxed. If the handlers of it should ever be forced or taught to make and sell it without disguise, for what it really is, the tax might be reduced so as to cover merely the cost of supervising the manufacture. It is not so much against the concoction itself when properly made, as against the fraudulent misrepresentation of it, that the dairy world is in arms.

It is calculated that the eight hour movement can affect only one in ten of all the workers in the country, the other nine-tenths being engaged in occupations in which shorter hours are impracticable, such as farming, herding, fishing, railroading and the like. All the other workers, however, as well as the great body of non-workers—the ailing, the old, and the young—must contribute towards the ease and comfort enjoyed by this one-tenth, but which they cannot share themselves. How are farmers who must suffer from the advance in wages or, its equivalent, the shortening of working hours of operatives, to gain any benefit from the labor agitation? The Knights of Labor and Grangers of Texas and Kansas have for some time been co-operating, and the State Grange and State Assembly of Knights of Labor of Michigan, have lately held a two days' conference at Detroit with a view to perfecting a similar scheme. It is proposed to establish distributing agencies at various central points in the State, where produce and merchandise of all kinds shall be gathered through purchasing agents, and then distributed to the members of both organizations. The plan, it is claimed, will not antagonize the merchants or commission men, as full prices will be charged for all goods, the profits to be paid back to the members in the shape of dividends. It is to be hoped that some means will be devised by which the farmers of the country shall partake of some of the advantages for which other toilers are contending.

"The Slaughter of the Birds" was the subject for discussion last Monday at the May meeting of the Sorosis, a club whose headquarters is in this city, and which is representative of the female culture, literature, intellect and fashion of this Western Hemisphere. It was conceded that women were "largely responsible" for the "injury to the welfare and beauty of our country by the destruction of our native birds;" but the English sparrow was justly denounced as an "intruder and a nuisance." In view of the fact that the slaughter of the birds "is calculated to alarm the lover of Nature and the agriculturist," it was resolved "that the members should pledge themselves not to use the plumage of native birds in any manner whatever," and that they would forward their "names to the Audubon Society to be enrolled among its members." Audubon societies (called after John James Audubon, the celebrated ornithologist, who died in this city in 1851), have already been established in several of the States by lovers of birds, haters of cruelty and friends of the farmer, and the movement is steadily extending. What a glorious thing is enthusiasm! Was there ever a great reform effected without it? Friends and neighbors may laugh at the enthusiast in any benevolent, humane or otherwise noble cause; but if their opinion is worth a thought, the laugh is tempered with kindliness, and right down in the hearts of the most "practical" of them there is an increased, if half-pitiful, respect. Oh, for an enthusiast in the cause of the birds in every neighborhood!

THE FIGHT AGAINST TEXAS FEVER.

The usual annual fight against Texas fever was begun last Thursday by Governor Oglesby of Illinois, who issued a proclamation, scheduling "all that portion of the United States South of the 35th parallel of latitude (the southern line of Tennessee) east of the Mississippi River; and south of the 36th parallel (running 30 miles south of the northern line of Arkansas) west of the river. The scheduled region embraces a small part of Southern North Carolina, the whole of South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana and Texas, nearly the whole of Arkansas, the Indian Territory, New Mexico and Arizona. The importation of cattle into Illinois from this whole region is prohibited hereafter between April 1st, and November 1st, or account of the existence therein of Texas or splenic fever, except under certain regulations prescribed by the State Board of Live Stock Commissioners and approved by the Governor. This year the proclamation is to go into effect on May 15. The Governors of the other States which are specially liable to infection will, doubtless, at once follow the example of Governor Oglesby. Then we shall probably soon hear once more of Winchesters and bloodshed on the "dead line," along the southern boundary of Missouri, Kansas and Colorado, especially the latter, the men of the North resolutely barring the march of the death-dealing herds which the men of the South, with equal resolution, are foreing onward to the "finishing" pastures of Nebraska, Dakota, Wyoming and Montana, or to the railroad shipping points for the markets of Kansas City, St. Louis and Chicago.

The cattle of the scheduled country are themselves, to all appearances, quite healthy; yet they impart the deadly fever to Northern cattle feeding on the pastures on which they have grazed, traveling over the roads on which they have been driven, or coming in contact with the bedding or feed which they have disturbed. If they are shipped by rail or river under proper precautions, no objection is made anywhere to their passage, and it is probable that this will be the exclusive mode of transfer ere long. A telegram early in the week from Albany, the northern terminus, nearest to the Panhandle, of the Texas railroad system, says the trail north from that point is now fairly open, and fully 45,000 head of cattle have started northward. Thousands of these were brought by rail from the southern and western parts of the State, as the severe drought through those sections forced cattlemen, owing to the scarcity of water and grass, to send their herds as far as possible by rail before starting them on the trail. This has never been attempted before, and cattlemen find that instead of the customary losses on the trail, there is no loss at all, and that the saving in time, wages, deaths and condition compensate for freight charges. The general impression there is that in a short time there will be no national cattle trail, as transportation will be found cheaper by rail than on the hoof. The resolute stand taken by the scheduling States will probably hasten the perception and acknowledgement of this fact.

BREVITIES.

Early potatoes at the Rural Grounds began to show above ground April 30.

We find many flowers on the Rostiezer Pear tree, that have six and seven petals.

The Yellow-flowering Horse-chestnut is the first large tree to clothe itself with leaves and blossoms

The leaves of the Variegated Tulip Tree, when first they unfold, are distinctly green and yellow.

During a walk in the woods last week we found that many of the flowers of the strawberry plants there growing were pistillates.

Circus time is at hand. Let the boys go, and go yourself. You will feel better for it, and all hands will do better work.

Chrysanthemums from seeds started in pots the last of February, were planted in the garden May 5th. It is supposed they will bloom in the Fall.

May 3.—Oats are well up, and thus early checked by drought. Oats never wholly recover from the effects of dry weather any more than potatoes do.

If ever the hens need yarding it is now. They will scratch up seed as fast as you can plant it. It is a shame to keep your wife chasing hens out of the garden. Fence them in or out.

The excellent cuts of Bantam fowls used in last week's number were kindly loaned us by Mr. Belmont Perry, of Woodbury, N. J. We unfortunately omitted his name from the descriptive article.

Our method of strawberry culture is to mulch with old manure in the Fall, and not to touch the soil until after fruitage. Then the soil between the rows is turned under and all weeds pulled up between the plants.

Water the horses frequently. We can't possibly urge this matter too often upon our readers. It will pay. If there is no water near the field, haul out a barrel on a drag, so that the horses can get a drink between times.

The making of gilt-edged butter exclusively is as much to be desired by the dairy interests of the country as that all men should deal honestly is to be desired by the public at large. We do not think, however, that the first of these ends is any more likely than the second to be advanced by the fraudulent handlers of oleomargarine, although friend Taylor is more sanguine in another part of this issue.

We have never before so early in the season seen so many potato beetles. It is not found that they do much damage to the leaves, though after so long a fast, it might reasonably be supposed that their appetites would be very keen. But potato beetles are *sui generis*. Any animal that, when its body is cut in two, walks off as if nothing had happened and lives for several days afterwards, might be expected to do other strange things.

In Nebraska alone the Union Pacific Railroad holds 2,344,901 acres of land which is not taxable, because the road has purposely neglected to take out patents for it. It is withheld from settlement, however, until its value shall be increased by the settlement of the adjacent sections by persons who have to pay taxes to open up and "improve" the country. The wealthy railroad magnates, without paying a cent of taxes, thus add to their millions on account of the taxes levied on poor settlers.

Miscellaneous.

SHORT TALKS FROM FARMERS.

ANY man who says, "Put tarred paper around young trees," doesn't know his business. I can kill more trees with tarred paper than all the mice or rabbits in the country can kill.

Ashtabula Co., Ohio. J. H. M.

It is well to kill all venomous snakes, but all the innocent species should be spared, protected and classed among the friends of farmers and fruit growers. Such snakes live wholly on small animals, insects, slugs, bugs and worms. Their size and activity enable them to consume more of these than birds or toads can manage. Where snakes are driven entirely away, insects, bugs and worms will surely multiply. Why not call the attention of entomologists, societies for the prevention of cruelty to animals and all others to this subject? Is it not time that the traditional hatred between the races of man and of serpents should have an end? The harmless snakes show their willingness to drop hostil ities by fighting our insect enemies. Shall man be behind them? S. W. H.

Madison Co., Ind.

My ducks at one year old, with free access to a pond of water, did not lay as well as they did at two years, confined with 20 hens, in a medium-sized yard, and given only a milk-pan of water. A small flock of ducks will pay far better than a pig. They will eat anything and make little trouble. SUBSCRIBER.

Steuben Co., N. Y.

A house lined with tarred paper is the nearest insect-proof of anything I have found in 20 years' work. The odor from the tar is conducive to the health of the fowls. Tar is called "healthy" for human beings. Why should it not be so for fowls? A lining of tarred paper on the house will surely help to line the egg basket with winter eggs. Try it.

Clearfield Co., Pa. H. F. S.

OUR bed-room opens into the dining-room. It takes a tremendous fire to keep both rooms hot in Winter. We can't afford to keep the door open all the time. My wife has invented a way of warming both rooms, that works like a charm. She suggested sawing off the top of the door about one-third down from the top. I did this and put another hinge on the lower part, thus making two doors out of the old one. A wooden button on the lower part holds them in place. In the afternoon we can open the upper door by turning the button and swinging the door on its hinges. The hot air at the top of the room passes into the bedroom just fast enough to keep both rooms comfortable. Try it. It is better than trying to keep the door ajar. H. M. C. G.

Orange Co., N. Y.

That Dakota furnace strikes me like a good thing. We have lots of old brush and chips every Winter, that could be used up in that way. Old stumps and roots have to be all hacked up before we can get them into any of our stoves. If we had such a furnace we could put them in whole. I have an idea that I can have a big tank made in the form of a "drum," so fixed that the last act of the heat before passing away will be to keep water hot. Then, by means of pipes, I can have hot and cold water with any of them. C. P.

Plymouth Co., Mass.

In spite of all that has been said against carp, I think it pays to keep them. My carp pond pays me well. I would not be without it. You can't have good carp with poor cooking.

Bucks Co., Pa. R. C., JR.

Two things on my farm have always troubled my eyes—numberless small stones and a bad "cat hole." One dry Summer I dug a well down through the "cat hole" till I came to gravel. Then I hired some boys to pick up stones, and dumped all we could pick up into that well. Then I put a dozen loads more at the bottom of the hole and scraped dirt over them. I can plow over the hole now without any trouble at all. I kept picking up stones at odd times and dumped them along on the road and put gravel on them. I have now got the best piece of road in this township in front of my farm. J. S.

Oakland Co., Michigan.

In this southern portion of Illinois, land is literally "tired." Thirty years ago it produced 60 or 80 bushels of corn per acre; now the average is but 20 or 25 bushels. For years farmers have taken all they could from the land and returned nothing—not even rest. Farmers are too much in the old ruts where their fathers worked so contentedly. The fathers had but few wants which were inexpensive and easily supplied. The present generation have many wants more costly and difficult to supply. Hence it is that so many boys leave the farm and seek other employment, and in after life regret the change.

Marion Co., Ills. J. L. H.

The best roosting poles that I have come across are iron rods wrapped about with thick woolen cloth. This cloth is saturated with kerosene with a small addition of oil of sassafras. No chance for lice there. "BUFORD."

Caldwell, Ky.

Orchards are white with bloom, and promise much this season, peaches alone excepted. Small fruits in good condition. Have tried keeping peach pits for use the second year by burying them three feet under the surface; it is a success.

Here is an explanation of the growth of weed seeds, such as morning glory, etc., year after year, on clean cultivated ground:—they are, part of them, buried at each plowing below their proper depth for germinating, and lie dormant. B. B.

Sangamon Co., Ill.

CATALOGUES, ETC., RECEIVED.

"RUSTLESS" IRON.—Catalogue from the Wells Rustless Iron Works, 9 Cliff Street, New York. The "Rustless" iron-work has been in the American market for about four years, though it has been in use for a much longer period in Europe. By means of treatment, first with superheated steam and then with highly heated air and carbonic oxide gas, the outer surface of the iron is converted into magnetic oxide of iron. This oxide is known in its natural state as magnetic iron ore. It has withstood centuries of exposure to both fresh and salt water. The cost is less than that of galvanizing or enameling. The rustless iron pipe is excellent for conducting water. Lead pipe is poisonous and many of the preparations used in preventing the rusting of iron contain lead or zinc, both of which are slightly acted upon by water. The "rustless" iron is free from all poisonous components, and as the work is done by heat, gas and steam, every crevice is reached. The "rustless" hollow-ware seems destined to come into very general use. We advise our friends to send for this exceedingly interesting catalogue.

THE BUCKEYE FORCE PUMP.—Catalogue from Mast, Foos & Co., Springfield, Ohio. The value of a pump depends upon its durability, simplicity, ease of operation, and safety from frost in Winter. It is claimed that the Buckeye pump possesses these valuable qualities in the highest degree. It is said that there are 100,000 of them in use in all parts of the country. The cylinders of the Buckeye are made of brass or of iron, lined with porcelain. The leather for the valves is of the very best quality, in fact, all material used is calculated to last for years. The stuffing or packing box found in most force pumps is not used in the Buckeye. The pump is easy to work, the flow starts at the first or second motion of the handle, and stops the moment the pumping ceases, thus leaving no dripping water to freeze on the platform. To learn the superiority of this implement more fully as well as to study the mechanism of pumps in general our readers should send for the catalogue.

MICHIGAN HORTICULTURAL SOCIETY.—Fifteenth annual report of the Secretary, Charles W. Garfield, Grand Rapids, Mich. Horticulturists and pomologists will find much to interest them in this volume. Michigan is becoming famous as a fruit and vegetable State. Secretary Garfield is one of the hardest workers in the profession. Readers of the present volume will be disappointed to learn that the usual Secretary's Portfolio has been omitted. The bright and condensed clippings that made up this portion of former volumes will be missed. The loss is well made up by a report of the last meeting of the American Pomological Society. This report is the best we have seen. The volume is so full of sensible hints and sound facts that we most heartily commend it to our readers. Every Michigan horticulturist who understands his business will secure one.

KELLOGG'S ROYAL SALT.—Circular from the Butter Preservation Salt Co., 384 W. 11th St., New York. The trade-mark of this new company bears a motto which should be dear to the hearts of the dairymen: "No more rancid butter!" This salt has received the very highest testimonials from chemists, business men and practical dairymen. Col. Wm. Crozier, an authority on dairy matters, considers this salt the best of all the brands he has ever tried. He rightly says that impure salt is a curse to butter-makers. It is certain that no inferior article could secure the testimonials which are printed in this circular. Our friends will do well to investigate the merits of this preservative. Address the company, as above, for the circular.

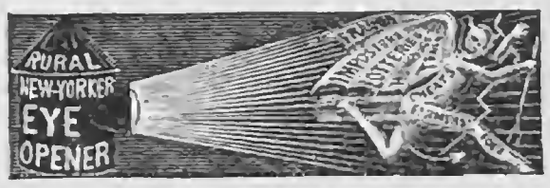
MISSOURI STATE BOARD OF AGRICULTURE.—Eighteenth annual report of the Secretary, J. W. Sanborn. It is unfortunate that the addresses of the secretary and the office of publication of the report have been almost omitted. They should be plainly printed on the title page. We also criticize the economy which necessitates the printing of such a volume in paper covers. The present volume is one of the best of the series. Every Missouri farmer should procure the book. The bulletins by Prof. Sanborn, The Grasses of Missouri by B. T. Galloway, and Stock Improvement by Prof. Shelton of Kansas, are worth the price of many a volume on agriculture.

SENECA LAKE GRAPE-GROWERS' ASSOCIATION.—Proceedings of the second annual meeting held at Watkins, N. Y. There is a great deal of interesting information to be found in this little pamphlet. One thing is certain—the men whose thoughts are given were practical grape-growers who spoke from experience. Among other articles we note a History and Progress of Grape Culture, Alumina as a Fertilizer, and The Vineyard from the Beginning to its Maturity. The Secretary discusses the shipping and handling of grapes. The pamphlet will be of interest to all who cultivate the vine. It will be sent on receipt of a stamp by the Secretary, C. N. Wixon, Penn Yan, N. Y.

KING OF THE HAY FIELD.—Catalogue of the Mallory Trackless Hay Elevator, manufactured by Herbert Baker, Toledo, Ohio. It is claimed that this is the best known device for filling a barn with hay. It is said to be the only hay elevator on the market that will deliver the hay at the sides and corners as well as at the end of a large mow. Fewer hands are required for pitching the hay into place on the mow than when the track elevators are used. The reasons why these elevators should be used are well stated in the catalogue. They should be read by all who desire to procure such implements.

INSECTS AFFECTING THE ORANGE.—A government pamphlet of 225 pages by H. G. Hubbard. The insect enemies of the orange are exhaustively and practically treated. The pamphlet is beautifully illustrated, the insects and their effects being well shown. A necessity to orange growers. Sent out by the U. S. Department of Agriculture.

THOROUGHBRED POULTRY.—Circular from Philander Williams, Taunton, Mass. Light Brahmas, Wyandottes and Plymouth Rocks. We saw specimens of birds from Mr. Williams' Yards at the New York Poultry Show. They were well worthy the prizes which were awarded them.



WHEN Texas became part of the Union after the war of '45, she retained all the public lands, so that ever since the United States have owned no land in the Lone Star State except a few small areas ceded for military posts, etc. Great and notorious as the corruption has been in the illegal appropriations, and dishonest cessions of the public lands of the United States, scandals have been still more outrageous and flagrant with regard to the public lands of Texas. These have been ceded and appropriated in the most unscrupulous and corrupt fashion, until now there remains no public domain in Texas. The large tracts still not owned by private parties are set aside for school and university purposes, or are asylum lands or belong to railroads. There are still a great number of old land certificates out, however, and as there is no land which they can cover, the holders, unable to sell, have in many cases illegally placed them upon lands specially granted for the above purposes, with the hope that at some future time the Legislature may be induced to make the certificates valid. There are several thousands of them outstanding, nearly all bearing date of about 100 years ago, when Texas belonged to Mexico. There are few of them in Texas, most of them having lately been sent for sale into the Northern States. It would be well to be careful about investing in Texas land certificates.

Blake and Riley are the names given by a pair of lottery swindlers arrested the other day in Milwaukee, Wis., for using the United States mails for fraudulent purposes. Thousands of letters were mailed by them to persons in all parts of the country, but especially in the West, inviting the recipients to invest. Each contained a fac-simile of the Louisiana Lottery scheme and a four-page circular giving a description of the lottery, with the name M. HUBER & CO., GENERAL AGENTS. Accompanying the circular was a "confidential," type-written letter from "Huber & Co., Bankers and Brokers, 431 Milwaukee Street, Millwaukee," stating that although the business was perfectly legitimate, yet as many doubted this, the writers, upon the receipt of $9, would send a ticket for the lottery, and if the ticket did not draw a $50 prize, they would send one each month until a prize was drawn; or upon receipt of $20 they would send four tickets, and if a prize was not drawn, then they would send 10 tickets a month until a prize was drawn. Thousands not being able to resist the tempting offer, sent on their money; but few of them ever received even a ticket, and not one of them ever got a prize. Why waste space in mentioning this swindle, after it has been suppressed—in carefully locking the door after the horse has been stolen? Because similar swindles have been flourishing for years, and will flourish for years to come, but not henceforth, it is to be hoped, on money enticed out of your pocket.

Complaints come from several parts of the country of a wolf in sheep's clothing. The beast dresses as an itinerant clergyman, and professes to be on a Bible-distributing tour. He asks for meals and lodgings, generally at farm-houses, talks a little pious clap-trap; but insists on paying for his meals and other accommodations, on the plea that the Board that has sent him on his travels requires him to do so and to show vouchers for the cost. He pays his entertainer a quarter, gets him to sign a receipt, and benignantly departs. Later that receipt turns up at a bank, or in the hands of some other "innocent holder," as a note for $100.25.

John Crawford, Marshall County, Ind., agreed to accept a sickle-grinder from an agent, and signed a postal card to that effect. In a few days he was notified that 36 sickle-grinders had been shipped to him as per written order—bill $216. He compromised by giving his note for $175. John Crawford won't in future be so ready to sign his name, even by way of accepting a gift from a canvassing agent, however sleek and glib-tongued.

A plausible rascal is selling Plymouth Rock eggs in Michigan for $75 a dozen, guaranteeing to buy all the chickens hatched therefrom at $100 each. The eggs are boiled. He or another member of the same tribe may turn up in your neighborhood to-morrow with this or a kindred swindle.

The EYE-OPENER'S notes show that this little trick has been practiced successfully in different parts of the country four times within three months, and attempted thrice more, and the Eye-opener's notes and clippings can't cover a tithe of the cases that actually occur:—A glib-tongued, well-dressed, solid-looking swindler comes along, and after more or less bargaining and bantering agrees to buy a farmer's place, depositing from $25 up, to bind the bargain. Shortly a confederate makes his appearance, and is very anxious to buy that particular farm, for which he is ready to pay, say, $500 more than the price offered by No. 1. He generally manages to work on the farmer so effectually that the latter agrees to let him have the farm, if he can get No. 1 to surrender his claim. On his re-appearance, No. 1 is ready to do so for, say, $200, in addition to his deposit, which the farmer pays him, and waits anxiously for the appearance of No. 2. No. 2, however, of course, never appears, and the farmer has paid $200 for the experience here given to you for nothing.

For Women.

CONDUCTED BY MISS RAY CLARK.

ELIAKIM GRAVES'S WOOING.

PART II.

WHEN Deacon Graves emerged from the woods and entered the wide meadow which was a part of the Drake homestead, he sat down and put on his stockings and shoes. And now unaccountable and hitherto unknown sensations began to creep over him. He felt weak and faint. What if Desire herself should come to the door? What should he say to her? Where would he find words to convey his meaning? And as he walked slowly up the lilac-bordered path to the front door, his knees trembled and he grasped his red silk handkerchief as though it were a rope to save him from drowning.

There was no light in the house. In those days people were in the habit of "sitting in the gloaming" on short, summer evenings. Eliakim knocked faintly, half hoping no one would hear him. There was a sound within as of some ponderous weight striking the floor. Then heavy footsteps, and the door opened disclosing the short, fat figure of Brother Drake, robed in his night-shirt.

"Good-evening:" said Eliakim.

"Good evenin', good eveuin', good e-v-e-n-in'," quacked Drake in a hesitating monotone, which became more assured as he slowly recognized his visitor.

"How are you prospering, brother? how are

you prospering?" questioned Eliakim in his short, crisp way.

"Wall, I'm so's to be waddlin', Deekin; so's to be waddlin'. Come in, Deekin, come in."

"No," replied Eliakim. "Is—I mean have you any pigs to sell, Brother Drake?"

"No I hain't, Deekin. I swan I sold the last one this mornin'. Did you want some, Deekin?"

"I wanted to enquire," was the answer, and Deacon Graves turned quickly and retraced his steps down the lilac-sceuted path.

He was routed, but not vauquished. He would combat this new foe of fearful self-distrust which had risen like a giant in his pathway. He would conquer it, and wheu opportunity offered, again seek an interview.

A couple of weeks had elapsed. The weather was unnsually warm and sultry with freqnent showers. Deacon Graves drove over to the village store one morning in his one-horse wagou to purehase some codfish and black molasses. As he entered the store a womau, dressed in a purple print gown and big gingham sun-bonnet, turned from the counter. As she pushed back the protecting bonnet he saw the snn-shiny face of Desire Hopkins. She greeted him pleasantly and passed out. A sudden inspiration seized him. He forgot the purpose for which he had come. He would ask her to ride and unburdeu his mind on the solitary road. So he hastily unfastened "Old Fan" and drove up beside her as she was carefully picking her way along the muddy street.

"Will you ride, Sister Hopkins?" said he, sitting very erect and bracing himself with the reins as again he felt that unaccountable feeling creeping all over him.

"Thank you. It would be a great favor," replied Desire, and she climbed up over the wheel aud seated herself beside him.

Eliakim's gaze was rivetted on the point of old Fan's ear.

"How is your mother's health this Summer, Brother Graves?"

"Good," snapped Eliakim. Quite unconscious of the Deacon's feelings towards her, Miss Hopkins chatted pleasantly of the crops, the weather and the church. The Deacou answered only in monosylables. His ideas would not frame themselves into words. The power of speech had left him. A cold perspiratiou broke out on his forehead. He grasped the wagon seat and drove at a pace which sent the soft mud flying in all directions. His opportunity was almost lost. Only a long hill now intervened between them and the place where Desire was now staying. Half-way up, driven to desperatiou by the fear that he might lose her, he made a mighty effort and began:

"Sister Hopkins, I have been thinking—that this will be an uncommon good year for turnips."

A little surprised by his manner, Desire pushed back her bonnet and looked up in his face. She saw the agitation depicted in his countenance, and straightway her womanly perceptions divined his secret. She blushed deeply, bnt Eliakim's gaze was fixed on a distant elm tree, and he saw it not. And being a modest woman, she sat silent.

Her destination reached, Desire Hopkins climbed unassisted ont of the wagou, merely saying: "Thank you, Brother Graves," to which her admirer responded: "You're much obliged, I'm sure," as he backed his wagon slowly around in the narrow road. Disappointment and hopelessness rode side by side with him on his homeward way, and he never once thought of the codfish and molasses until his mother inquired for them when she set about getting the breakfast the following morning.

And the busy seasou came on apace. "From early dawn till dewy eve" Eliakim Graves labored, patiently and uncomplainingly, while his heart ached with its burden of unconfessed devotion. The tall form grew gaunt and the venerable feather-bed could no longer soothe its occupant to untroubled slumber. He saw Miss Hopkins every Sabbath at church and she was always present at the Wednesday evening prayer meetings. But his limbs refused to move towards her; his tongue was as lead in his mouth when he would have spoken.

By and by a rumor came floating on the hazy, fruit-scented, autumn air to the effect that Judge Watsou (a portly, pompons widower with seven children) was paying attention to Desire Hopkins; and Deacon Graves himself caught the Judge "casting sheeps' eyes" over into the corner pew where Desire sat, resplendent in a new blue velvet bonnet with purple pansies. And the Deacon, half beside himself with love aud fear, was powerless.

And so the weeks went by, and Thanksgiving Day was at haud. There was to be a donation party at the house of the minister and everybody was invited. And, of course, everybody went and took his wife, mother, sister or sweetheart, as the case might be. And Desire Hopkins was there, and so was Eliakim Graves, also Judge Watson. For a time the company sat bolt upright aronnd the rooms, conversing in whispers as though the occasion were a funeral.

Then a merry youth out in the great kitchen proposed a game of "snap-and-catch-'em" and soon a large ring was formed in the spacious room. The sound of flying feet and shrieks of laughter woke up the company in the other rooms and one after the other edged out to "see the fun." Soon, nearly all were participating in the lively game, and "Needles Eye" and forfeits were proposed. In the course of the latter game Desire Hopkins was found guilty of misdemeanor and sentenced to "go to Rome," and her compauion on the journey was to be none other than Deacon Graves, who had persistently kept his seat in a corner. When Desire, in obedience to the rules of the game, walked modestly up to him, holding out her plump hand, Eliakim, though he would gladly have gone with her to the Antipodes, if he might, silently shook his head. No persuasion could move him, and he sat grimly in his chair and watched Desire as she made the journey with the odious Judge, and afterwards saw him lead her to a seat on a sofa and sit down beside her.

The sight was too much for the Deacon; he grew desperate. Something must be done immediately or all was lost. He rushed out into the open air to cool his fevered brain and devise some plan to get the start of the Judge.

As he walked up aud down the long lane which led to the barn, his eye fell upon the Judge's fine gray horse hitched in an open shed.

A bold idea suggested itself to the almost despairing mind of the Deacon. He unfastened the halter, threw it carelessly over the horn of the saddle and struck the spirited animal a blow which sent him flying out of the yard and up the road toward his home. Then he walked into the house, and standing in the door of the parlor, said in a loud, full tone: "Judge Watson, your horse is loose!"

As the Judge, filled with dismay, started quickly and left the room, the Deacon coolly crossed it and took the seat by Desire's side, which had just been vacated. He had conquered the giant at last and was perfectly cool and self-possessed.

"Sister Hopkins," said he, in his crisp, abrupt way, "I want a wife. You suit me; will you have me?"

And Desire Hopkins, who had been considering the matter ever since that revelatiou had come to her during their ride on that sultry June morning, answered:

"Yes, Deacon Graves, I will."

LIZZIE CLARE.

FOR, OR AGAINST HOME COMFORT.

THE decoration craze had seized the three Selby girls, and when the parlor overflowed and father persisted that there was enough and to spare of trumpery in the dining-room, they turned ou the overflow to the spare room. Walls, mantel and brackets were soon full, and the cry was "still they come." To cap the climax, one of the girls bought a second-hand scroll-saw of a mother who coaxed it away from her boy for some valuable considerations in the way of mince pie and doughnuts for nutting excursions. And now the decorative business began in earnest.

Abby "could learn scroll sawing if a boy could," and learn she did. Presently the old clock had an open-work border; then the pictures were all adorned; a wall cabinet screwed on between the windows to hold more placques and cups of Susy's painting, and all she could not dispose of elsewhere found a resting place in the spare room. Crochet and needlework were Louisa's strong points, and something in her line fluttered from every chair, mantel and window curtain.

They all thought what a blessing it was they had such a careful housekeeper as mother, to do the sweeping and dusting in the midst of so much labor-making finery. They believed in a divisiou of labor. They made the nick-nacks and she took care of them. There are many modern households which divide the work that way—the more the pity.

The transient guests who enjoyed (?) the hospitality of that spare room never forgot the occasion. Summer or Winter, when you entered it, the chill, dank air from a sepulcher seemed to greet you. The blessed out-door air and sunshine must be resolutely shut out, for it would fade or make havoc with some of the airy finery. One must move about as he would in a crowded china store to avoid disaster to some work of art it had taken long and patient toil to make. "Overdone" would have been an appropriate motto to hang on the wall. The whole would answer for a museum or bazaar, but was not comfortable for a living room. The subject quite lately up for discussiou at the womau's Club—"Sorosis"—in New York is an appropriate one for many young ladies of to-day to thoughtfully ponder. "Do the present interior decorations of our homes promote comfort and hapiness, or discomfort and needless service?" was the substance of it, though not the precise words. The overdone style is certainly not productive of that most blessed quality in auy household—home comfort. OLIVE.

"FIGHTING THE ENEMY."

I TOOK up a book this evening and read the title, "Fighting the Enemy." Now I do not know what enemy it refers to, as I have not read the story, but it started a train of thought. Have we not all enemies, even in these peaceful days? Certainly we have to contend with our inclinations sometimes and subdue them. How hard it is to make ourselves perform our duties always all housekeepers will acknowledge; oh! what a fight we have to shake off the enemy when the monotony of our work appears to disturb the tranquility of our souls. Why should we call it monotony? It is an enemy who whispers the suggestion. Let us conquer him.

At other times we are troubled because we cannot have all the conveniences and luxuries in our homes which we think we should so much appreciate. Why do we not make the very best of what we have? Because our foe—discontent—is attacking us. Let us crush him! Shame on us! we have unnumbered blessings to be thankful for! Have you not in visiting large cities noticed how those who are determined to "make a display" are tormented with a great number of enemies which we, who live in the country can keep at a distance? Think of the fathers and mothers who sacrifice themselves that their sons and daughters may enter and keep a fair standing in fashionable society! Oh! if only they would conquer the enemy, vanity! their children would become more noble men and women; the daily papers would contain fewer accounts of dishonest transactious by those who will not destroy this giant evil. Once I thought if I were an artist I would paint a large picture of a vast army moving along the dusty highway, tired and heated. By the roadside should be a fallen warrior—large and handsome, but fallen, not killed—utterly discouraged by the long march. I thought that to be a type of human life, and that the weary one should receive a large share of sympathy, because of all he had to contend with. But now, there should be a companion picture; the fallen soldier must rise and press on, until the enemy is subdued, for it is much grander to conquer than to yield an inch to our despair. After a while we shall lay aside our weapons and take up our palms. Then shall we rejoice if we have unflinchingly performed our work and kept down our adversary; fighting under our great Captain who bids us follow His lead. S. S.

Domestic Economy

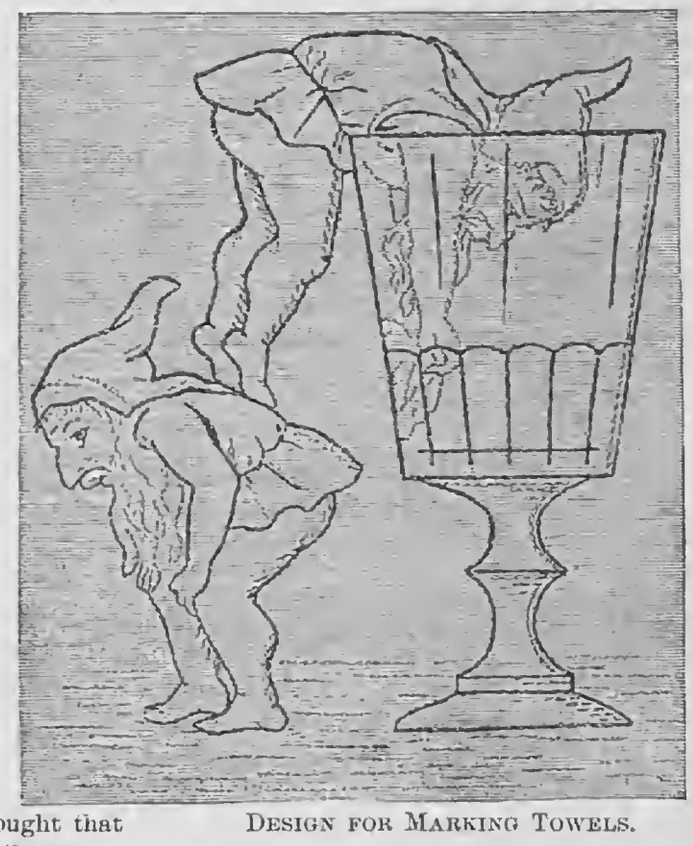
CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOUSEKEEPING IN CALIFORNIA.—VI.

MARY WAGER-FISHER.

ONE of my Oakland acquaintances who has employed a good many Japanese in her kitchen—one at a time—entertained me one day with some of her experiences. She finds the Japanese more intelligent than the Chinese; but not so interested in their work. She thought a high-priced Chinaman—$30 a month—the best servant one could anywhere secure. The Japanese come to this country to be educated; the Chinese to make money. My friend explained that the reason she had had so many Japanese was owing to the fact that as soon as they earned a little money they went to school. Shortly before, she had employed Iberaike upon condition that she should teach him how to work, and he was to remain with her for a year. She spent almost one entire week in the kitchen teaching him how to cook, and soon after he came to her with a sorrowful countenance. "I am grieved to inform your loveliness," he began, "that I have conferred to Sanometer, and he tells me that I must go to school immediately" (Sanometer was a leader or adviser of the Japanese); "and that I must sacrifice my body to my country's good." Iberaike was quite a high-toned Japanese, too much so for kitchen work, and he had great ideas of serving his country. His successor Ken knew nothing of work, and evidently did not wish to. He read John Stuart Mill, and talked learnedly on political economy. He spoke some French and was very desirous to go to France. His mistress asked him one day why he did not study medicine, as good physicians were needed in Japan. With a scornful toss of his head he said: "Woman can study medicine."

For some time this lady had a Japanese servant named Mori, who had been at school considerably and wrote very amusing English letters. One time he was ill and had to go to an hospital, and he sent her news of himself on a postal card: "My sickness not well now." Again, in trying to supply his place for his employer, he wrote: "Dear Madam, Please you take this boy, who his name is Yahemma as Japanese name, but you call his name Gerge. I will remember your kindness, especially I thank you that you tolled me this words: 'You try to become a good man.' This your kind word coast me more million dollars"—meaning worth more, etc. Again he wrote, "I hape anxiously to know how your families are in this warme weather. Is Mr. B. healthy working on his business? Also your daughters and sons? I had begun to study my lessons at the last Tuesday. In my lessons, Greek and Latin are very hard, but I am trying to learn them slowly. I have sent you Gerge at the last Friday, but he is not a boy who I promised you. It is Masuda who I promised you to work in your house after me. When I leaved your house at the last Friday, Masuda could not go to you for some business, and Masuda sent me Gerge. At that day Masuda promised Gerge that Masuda must go to you after Gerge worked two weeks in your house. I think Gerge wish to go away from you by the reason which I written above. If Gerge leave your house, then my friend Masuda who I promised you, will take work in your house. Masuda is a nice and smart boy, but he cannot understand English well. Please you tell him how to do every thing, and you can pay him what you think, $2 or $2.50 a week in first week. If Masuda can not work in your house, you go and find another school-boy in Japanese Gospel Society. I think you can find some nice school-boy there."



DESIGN FOR MARKING TOWELS.

In discussing housekeeping, East and West, this lady—Boston born and bred, but who has long lived on this coast—said that housekeepers on the Pacific Slope did not wear themselves out with household cares as did those in the East—their housekeeping was less fine and there was more dirt in the corners! They were, however, cleanly in all essential things, but had reached the point of knowing what to do and what to leave undone, and did not worry over non-essentials. As there is far less of the kind of economy practiced here that Benjamin Franklin enunciated in the now trite axiom: "Take care of the pennies and the dollars will take care of themselves," than in the East, another kind of economy is practiced, that saves time and strength—two factors that many of us undervalue. Instead of "eternally darning" stockings for the boys, mothers buy the cheap hosiery and discard it when the holes become formidable. A dozen pairs of stockings at 10 cents a pair will last a long time for even work and play wear, and

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

cost no more than one really fine pair for Sundays. Of course, what a boy needs is a pair of buckskin leggins that reach up to his neck, or his waist at least, and 17 pairs of calfskin shoes per annum, which was the number worn out by a certain New England girl, who afterward became a great and notable woman—partly because she had an unusually strong and well developed body to begin with. Then the washing and ironing almost universally are done out, and the laundry is as much a feature and necessity of society here as the small grocery or country store in the East, the mill and the blacksmith shop—and it simplifies housework wonderfully. The cheap and excellent laundering of the Chinese has undoubtedly had much to do with popularizing this branch of work, and the steam laundry will take the place of the Mongolians as they are driven out. With "bread from the bakers," it is easy to see how a great many families can dispense altogether with "hired help," and when all woman kind is "above" working in the kitchen; housekeeping then can be made possible by the transfer of the heavy work to outside forces. Public kitchens will probably also be established, where meats can be roasted and soups made—and, all things considered, it will be economical financially, too.

PATTERN FOR KNITTED LACE.

CAST on 16 stitches.

1st row.—(a) Knit 2, thread over twice, purl 2 together, knit 1, thread over twice, purl 2 together, knit 1, thread over twice, purl 2 together, (a) knit 1, (b) thread over twice, narrow, thread over twice, narrow, knit 1, (b),

2d row.—(c) Slip 1, knit 1, knit 1 and purl 1 in double loop, knit 1, knit 1 and purl 1 in double loop, (c) knit 1, (d) thread over twice, purl 2 together, knit 1, thread over twice, purl 2 together, knit 1, thread over twice, purl 2 together, knit 2, (d).

3d row.—Repeat from (a) to (a) 1st row, knit 3, repeat from (b) to (b) 1st row.

4th row.—Repeat from (c) to (c) 2d row, knit 3, repeat from (d) to (d) 2d row.

5th row.—Repeat from (a) to (a) 1st row, knit 5, repeat from (b) to (b) 1st row.

6th row.—Repeat from (c) to (c) 2d row, knit 5, repeat from (d) to (d) 2d row.

7th row.—Repeat from (a) to (a) 1st row knit 7, repeat from (b) to (b) 1st row.

8th row.—Repeat from (c) to (c) 2d row, knit 7, repeat from (d) to (d) 2d row.

9th row.—Repeat from (a) to (a) 1st row, knit all the rest.

10th row.—Knit 14, repeat from (d) to (d) 2d row.

11th row.—Repeat from (a) to (a) 1st row, knit all the rest.

12th row.—Bind off 8 stitches, knit 5, repeat from (d) to (d) 2d row.

There should now remain 16 stitches on the needle as at the commencement. Repeat from 1st row. DAISY.

HINTS FOR THE DINING TABLE.

NAPKIN rings are in bad taste, as a soiled napkin is not supposed to be put upon the table a second time. This for people who can afford to practice high etiquette; but if you do put a napkin on the table a second time, then by all means have some means of distinguishing it from that of another person.

Breakfast napkins are very pretty with the family initial embroidered in the center. In the end it is the best economy to purchase the best of napery; good double-damask, Irish linen. There is almost no limit to the usefulness of such goods. If you darn the small thin places as soon as they begin to wear, they will last an indefinite period as table cloths, and afterwards the borders which do not wear so rapidly, will make good napkins for everyday use. The parts that are too much worn for this, make good glass and china towels.

I saw at a friend's house some very pretty side-board covers. They were made from the border of an old-table cloth; several inches of the pattern were traced with red marking cotton, forming a showy border. They were lined with old white muslin, and when starched very stiffly, stayed clean for a long time.

Where there are children, in purchasing new table napery it is better to buy heavy, coarse linen for every-day wear. Keep the clean napkins in a drawer with lavender and other sweet herbs, or small bags of orris root, so that they will come to the table smelling of these, instead of vile laundry soap.

At a fashionable dinner the napkin should be allowed to drop unfolded by the side of the plate after the meal; at a social dinner follow the example of your hostess.

Philadelphia. MRS. A. E. MELVILLE.

B. B.'S.

A FEW months ago a lady contributor to the R. N.-Y. recommended corrosive sublimate very emphatically. Now, several years ago I had a double stone building that I converted into a kind of "flat" for tenants by subdivisions for families and with numerous extemporized board partitions for bed-rooms, and in less than two years the house was alive with B. B.'s. The lady's antidote was my favorite, and by the greatest vigilance I could in a measure hold the upper hand, but could not exterminate them. I then decided to give a thorough trial to pyrethrum—more commonly called Persian Insect Powder. The plant is now cultivated in this country. A Mrs. Hill, of California, had 100 acres in 1884, and manufactured 10 tons, and in 1885 she planted 200 acres more. It usually sells at about $1 per pound. I sprinkled about an ounce in empty bed-rooms, and proportionately more in larger rooms, and closed the doors to confine the odor to do its deadly work. In occupied rooms a sheet was spread on the floor or carpet, and a good thumb-and-finger pinch, or half teaspoonful was sprinkled on each loose article of bedding and wearing apparel hanging in the room, and all were tied up in the sheet so that the odor might effectually permeate each article. The powder was liberally dusted on the ends and edges of the mattresses and ticks, and rubbed in (it disappears under the rubbing like starch flour), and a small trail of the powder was drawn round on the strips that support the slats and in the grains or notches for them, and some was sprinkled on carpets and around baseboards. This was done in the morning, and the rooms were kept closed till bed time. The experiment proved a grand success—the house was cleaned.

Others in this vicinity have tried with equal success—and some feel as though they had little sympathy for those who are troubled, and persistently fight the pests in the old-fashioned ways of overhauling and scalding. Though scalding kills those exposed to it, it does not touch those that are secreted about the walls, nor those just hatched and attached to the clothing, and hence the failure to make a total extermination. I think an ounce-and-a-half to two ounces about right for an ordinary bed-room and bed—no matter about the number of B. B.'s, it takes just as much odor in the air of the room to kill five as to kill a thousand. All the rooms of a common house can be treated in less than an hour, so the saving of labor more than balances the cost of the powder.

An ounce put into a gill of cold water with as much whiskey to keep it from spoiling, and used as cologne water on the heads of children or on dogs, will eradicate vermin.

S. D. NEWBRO.

DOMESTIC RECIPES.

A GOOD PLAIN CAKE.

ONE cup of brown sugar, one egg, one cup of sour cream, a pinch of salt, two cups of flour, one teaspoonful of soda, flavor with nutmeg.

PICKLED CRAB-APPLES.

I WISH to tell the sisters if they are intending to make sweet pickles out of Hyslop crab-apples, to put them out doors over night, and let them freeze solid—this will take out all the bitter taste. Do not thaw them out but put them in the steamer and steam till done, then pickle as usual.

When making frosting, use only the freshest eggs.

A few drops of kerosene in cooked starch keeps the irons from sticking.

MRS. RUTH E. HOOSE.

POTATO SOUP.

THE following is, I think, an improvement upon the potato soup given in RURAL of Jan. 16. Boil one large turnip cut into dice, three tablespoonfuls of rice and a small spoonful of salt in two-and-one-half quarts of water for three-quarters of an hour. Then add 12 large potatoes peeled and sliced and cook until they fall in pieces.

Mix one tablespoonful of flour with one egg, and add to one pint of milk and stir in while boiling; add a piece of butter the size of an egg. Boil up and serve.

TURNIP PIE.

Not having any carrots, I tried turnips, and they were excellent, made the same way as pumpkin pies. One medium-sized turnip will make two pies. EVA M. HOLMES.

WALNUT CAKE.

BEAT one cup of granulated sugar with half a cup of butter, yelks of two eggs, half a cup of milk, and enough flour through which one teaspoonful of baking powder has been sifted, to make an ordinary cake batter. About two cups will be required. Bake in a round tin; when done and cool split in two. Crack out a pint of walnut meats, save out some of the whole halves for the top of the cake and chop the rest. Boil together a cup of sugar with a third of a cup of water, try it in cold water, and when it is stiff but not brittle, pour it over the whipped whites of two eggs, beat hard until it creams, mix it with the chopped meats, and spread half between the cakes and the rest on the top. Press the whole meats tightly into the top. Orange cake can be made in the same way, using, instead of the nuts, the juice and grated rind of two oranges. BESSIE.

QUESTIONS ANSWERED.

FOWL A LA MAYONNAISE.

WE give the following in answer to a request for the same:—Roast a young fowl, and when cold cut it up into joints. Put a layer of tender lettuce leaves on a dish, and on this a layer of the chicken. Over these slice hard-boiled eggs, about two, two anchovies and a few capers. Now add another layer of chicken, some washed water-cress dusted with a little dry mustard powder. Top the dish with some of the center leaves of lettuce, the wings and some small pieces from the breast. Garnish with slices of egg, and pour a mayonnaise over the whole.

FOWL A LA REMOULADE.

PUT a chicken trussed as for boiling into a stewpan with a pint of stock, an onion, a carrot, a slice of lemon and a bunch of sweet herbs. Simmer until tender, let it become cold, cut it into dice, place in a salad dish and cover with a dressing made of equal parts of table oil and vinegar, and the yelks of two hard-boiled eggs rubbed smooth. Cover with pickled French beans and slices of hard-boiled eggs.

Miscellaneous Advertising.

Pain in the Side

Is a symptom of disease. It may be caused by Rheumatism, or by Neuralgia, but it usually indicates a disordered condition of the Stomach, Liver, or Kidneys. Ayer's Sarsaparilla corrects the action of the vital organs, and removes every trace of disease from the system.

Last fall and winter I suffered from a dull, heavy, pain in my side. I did not notice it much, at first, but it gradually grew worse until it became almost unbearable. During the latter part of this time, disorders of the Stomach and Liver increased my troubles. I began taking Ayer's Sarsaparilla, and, after faithfully continuing the use of this medicine for some months, the pain disappeared and I was completely cured.—Mrs. Augusta A. Forbush, Haverhill, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

News of the Week.

HOME NEWS.

SATURDAY, May 8, 1886.

THE boycotting of the Mallory steamship line at Galveston, Texas, has been declared "off" by the Knights of Labor, after it had really collapsed. The "Gould system" strike originated from efforts to stop the transportation of freight to the vessels of this line. The Gould strike has also collapsed and has been declared "off" by the Executive Committee of the K. of L, after a spirited address by the visiting Congressional Investigating Committee, and a conference between it and the St. Louis Citizens' Committee and the Local Board of the K. of L. Many of the old hands have gone to work again on the roads; others must find employment elsewhere, as the capable among the new hands will not be discharged to make room for the strikers.....The strikers in all cases are paid a certain sum weekly while idle during the strikes; how are those to live who can't get work after the collapse of the strikes?.....Strikes for shorter hours—ranging from eight to 12, according to the "work day" of each class before May 1—have been very numerous all over the country during the week. Many trades have granted the whole or a considerable part of the concessions demanded, especially those, such as the building trade, which cannot be affected by competition in other places where the shorter hours are not observed. Other employers resolutely resist, on the ground that either they want to manage their own business; or that they will not submit to coercion; or that while willing to treat with their men individually, they will have nothing to do with labor organizations; or that the compliance with the demands would either disastrously cripple or entirely ruin their business. The results will doubtless be a considerable decrease in the hours of labor in most trades with a corresponding decrease of wages in many cases. "Masters" and "men" are organizing, and as each class will be likely to press any advantage that may arise, the struggle is likely to continue indefinitely. From extended telegraphic inquiry, this morning's Bradstreet estimates that 325,000 men have hitherto taken part in the short-hour movement; that 175,000 have struck, and 150,000 have received concessions without having to strike. Some 35,000 have gained their ends by striking. Business has been greatly disturbed if not absolutely paralized at Milwaukee, Cincinnati, St. Louis, Baltimore and several other large centers of wholesale trade. At Chicago no wholesale business worth mentioning has been done. The few mail orders received have been hung up, as merchants generally have been awaiting the settlement of the labor troubles.....The most disastrous labor troubles occurred at Chicago and Milwaukee. In both cities there are large colonies of foreign revolutionists—chiefly Socialists, who want an equal division of all property, and Anarchists, who want the abolition of all laws and a complete upsetting of the present order of society. These have, for the most part, fled or been driven from their own countries; others, discontented with repression at home, have sought license, not liberty, here. They have been permitted to talk, harangue, march, drill, buy and prepare explosives, and imagined they could do as they liked. The worst firebrands in Milwaukee are Poles; the worst in Chicago, Germans. On May 1, over 40,000 men struck for shorter hours in Chicago, and the agitation continued violent but peaceable till Tuesday. A large body of thieves, cut-throats and the offscourings of a large city, mixed with discontented workmen and hot-headed revolutionists, then met in a large square, and were greatly inflamed by incendiary speeches from the Anarchist leaders. A considerable squad of police arrived on the ground to preserve order, and were greeted with insulting cries and menacing gestures, then pelted with stones, and finally a dynamite bomb was hurled among them, killing a number and wounding and mutilating many others, and some of the pressing crowd. The police fired upon their assailants, and a number fell dead and wounded, while a second volley scattered the cowardly mob in all directions. Much trouble, but no serious fighting has occurred since. Large subscriptions are being raised for the families of the killed and wounded officers. A large number of arrests of Anarchists and other ringleaders of violence have been made. Much dynamite, many incendiary manifestoes, etc., have been seized. The Knights of Labor and trades' unions have vigorously repudiated all connection with the outbreak, or any form of illegal violence. The strikes still continue, but in spite of mutterings of more trouble, no serious outbreak is feared.....At Milwaukee the militia were called out to protect a number of threatened factories; they were approached by a horde of excited, menacing rioters; these were sternly warned to halt, and on continuing their advance, the troops fired low, to kill. A number were killed, and more wounded, while the rioters sought safety in flight. In both cases the foreign Anarchist and Socialist elements were the prime movers in the disturbances.....There is little or no likelyhood that the Democratic House will pass the Republican Senate bill admitting Dakota as a State. It is sure to be Republican and must, therefore, wait at least two years more before any part of it can be admitted.....A great deal of trouble is constantly arising from the crossing of cattle over the border line between the United States and Mixico. Congress is seeking to surpress the evils.....Efforts are still being made in Congress to close the U. S. mails to all lottery circulars, etc., as well as to newspapers that publish lottery advertisements.....The extension of the benefits of the Signal Service to farmers is still being pressed in Congress.....Ex-President Arthur was well enough last Tuesday to attend a great dog show held here the past week. ....The House objects to make appropriations to carry into effect that Mexican treaty negotiated by Gen Grant and opposed by our tobacco and sugar industries.....The treaty with the Sandwich Islands, admitting their sugar duty-free, is however likely to be renewed.....Our annual pension appropriations for the benefit of the survivors of the late war are as great as those of many great nations for the support of their standing armies and pension list. Congressman Hewitt of New York says the taxpayer's limit of endurance has been reached, and the discontent of a tax-ridden people is breaking out in riot, death and dynamite.....Mrs Garfield's Cleveland residence is offered for rent..... ....Our occasional contributor, Prof. Brooks, of Phelps, N. Y., has discovered another comet—this is now in the constellation Pegasus. ....The Cherokees are to distribute their $300,000 lease money per capita—about $20 apiece. .....Maxy Cobb, the most famous trotting stallion in the world, died Monday, at Philadelphia, of inflammation of the bowels. His record, 2.13¼, made at Narragansett, near Providence, R. I., Sept. 20, 1884, has never been equaled by a stallion. It is said $40,000 were refused for him a short time ago..... The Lachine and Rideau Canals, Canada, were opened for navigation Monday..... The big log-rolling bill, appropriating $15,000,000 for "Rivers and Harbors," got 41 majority in the House, Thursday.....Jeff. Davis has attended the unveiling of the late Senator Hill's statue, at Atlanta, and a local centennial celebration at Savannah, and has been everywhere enthusiastically received by mighty crowds gathered to do honor to the Ex-Chief of the Confederacy. He thinks the Lost Cause not dead, but sleeping. Considerable loyal anger at the North, but the sober sentiment is that the North fought to make this a free country, where all can do as they please within the law, and that not the least among its glories is the fact that the head of the most extensive and bloodiest rebellion the world has ever seen, has been allowed to live to talk as this old man has been talking..... ..Yesterday the American fishing vessel David D. Adams, went into Digbyport, in the Bay of Fundy, to buy Canadian bait and ice. The commander of the Canadian frigate Landsdowne at once formally seized her. Some indignation, not unmixed with amusement here. How will Canada wriggle out of the difficulty? We say our vessels have a right to trade in Canadian ports. The Imperial Government will hardly support the colonial action. The President is urged to close American ports to Canadian vessels till the wrong is righted..... ..Gov. Larrabee, of Iowa, warns violators of the Prohibition Law that henceforth they must expect no Executive clemency, and calls upon priests, ministers, teachers and the press to enlist their moral forces for the law.....The Kentucky Legislature is working on an anti-lobby bill, which imposes a fine of $500 on any person loitering around the lobbies of either House importuning members to vote for or against any bill, this being held *prima facie* evidence of guilt.....Gen. Logan's amendments to the Mexican Pension Bill would, it is calculated, require an expenditure of not less than $600,000,000!.....

FOREIGN NEWS.

SATURDAY, May 8, 1886.

OF late no European question has been of more interest to all English-speaking people the world over than Gladstone's attempt to satisfy Irish longings for "home rule," and make a satisfactory settlement of the Irish land difficulty which has cursed the "fairest peasantry" in the world for generations—yes, for centuries. The "Grand Old Man," after a long life of active statesmanship, finds the only permanent way out of the interminable Celtic discontent and agitation lies in the direction of an Irish Parliament for the Irish in Dublin, with an Upper House whose members are to be partly named by the Crown, partly represent the wealth and aristocracy of the country, and partly be elected by the people. Full precautions seem to be taken to restrain any manifestation of disloyalty to the Empire; and all the concessions made yield a measure of self-government and independence considerable below what is now enjoyed by Canada and the Australian and New Zealand colonies. Supplementary to Gladstone's Home Rule Bill, is his Land Purchase Bill, which provides for the purchase of Irish estates from the landlords for sums aggregating 20 years' rental, the funds to be supplied by the Imperial Government. The land is to be divided into small farms among the present tenants and all others who may desire, and the purchase money is to be paid to the Government in stipulated yearly installments, the land to remain as security for the debt until paid. Only a bare idea can be here given of the general drift of both measures, each of which has a multitude of provisions and safeguards.....The Liberal Cabinet split on the measures, Lord Hartington, the aristocrat, and Mr. Chamberlain, the radical, being alike unable to agree with their Chief, Mr. Gladstone. Other less important personages followed their example. The Liberal party is split on the matter, the bulk of the party adhering to the fortunes of "Our William." The latter has made several concessions, and seems willing to make several others to secure a majority in favor of the "second reading" of the Home Rule Bill in the Commons. Then it will be in "Committee of the Whole," and amendments, and alterations will be in order. There's nothing definite now, except that after what has been done and said by England's foremost Statesmen, Ireland can never again be subjected to the humiliation, rapine and tyranny of the past. ..Perhaps a greater subject of general European interest just now is the attitude of Greece. After the Turko-Russian war, the treaty of Berlin gave Greece a large slice of Turkish territory on the northwest of what she already had, as a reward for her pacific conduct during the war. Turkey has ceded only a part of this gift, and during the late war between Bulgaria and Servia, Greece resolved to pitch in and seize the rest of the territory, as Turkey would probably be hampered by the rival belligerents. The sudden collapse of Servia, and the consequent peace, rendered the Greek action too slow, while the acquisition of Eastern Roumelia by Bulgaria exasperated Greek jealousy. The little kingdom, the pet creation and protege of the Great Powers, continued to increase and drill her army and fit out her navy. The Great Powers protested and threatened, but she kept right on. The Turks, if permitted by the Powers, could have made mince-meat of the Greek hosts in short order; but Turkey knew that her first attack on the Greeks would be the signal for the instant advance of the Russian and Austrian armies, and would probably result in a general European conflagration. She has been obliged to keep up her army on a war footing, however, at vast expense to her bankrupt treasury, by the action of Greece, and has been vigorously protesting to the Powers. During the week these have brought their greatest pressure to bear upon the Hellenic Government, but from to-day's cablegrams it appears, in vain. This morning's cable says the Greeks are pushing rapidly to the frontier; the Turks are there already, and a conflict may occur at any hour. The Ambassadors of the Powers have left Athens and embarked on the vessels of their respective nationalities, except the Russian Ambassador. The fleets of the Powers will blockade the Greek ports and prevent a naval conflict between the Greeks and Turks. They are trying to coerce the plucky little kingdom by boycotting her. There are so many open and concealed complications and entanglements in the "Eastern Question" that if war once begins, no one can tell when or how it may end, or how many nations may plunge or be drawn into it.....

AGRICULTURAL NEWS.

SATURDAY, May 8, 1886.

THE weight of fleeces from the 31,710,221 sheep in New South Wales, last year, was, for the aged sheep, unwashed, five pounds; hot-water washed, three pounds three ounces; scoured, two pounds 14 ounces. Lambs, one pound 13 ounces unwashed; one pound nine ounces washed.....Florida cattle ranges aggregating 67,200 acres have been purchased by Wyoming cattlemen, for $84,600..... The practice of spaying is said to be rapidly increasing on the ranges. There appears to be no other way of disposing of the over-stock of she cattle than to spay them and convert them into beef. Spayed animals are claimed to fatten more rapidly than steers, shrink less in transit and command better prices in the Eastern markets.....The grass seed trade of Chicago, during 1885, amounted to 68,000,000 bushels..... Rich beds of phosphate have now been found in Florida. Hitherto the supply, except from bones, has come mainly from the phosphate beds of South Carolina..... In the six months ending March 31, England imported from India 7,486,000 cwts. of wheat, as against only 4,024,020 cwts. in the same period of the preceding year; while the imports from America were only 5,984,000 cwts. against 10,264,000 cwts.....The French appropriation for the Ministry of Agriculture for 1886 is $8,154,312.....The Kentucky House recently passed a bill making it a felony, with from one to three years' imprisonment, to bring into the State cattle diseased with pleuro-pneumonia, or to own cattle so diseased and to allow them to come in contact with healthy cattle; also making it a misdemeanor, with from $100 to $1,000 fine, and a term in jail, to keep cattle so diseased in any inclosure within 600 feet of the highway. Further, upon complaint, the county judge is to have a jury examine any herd, and kill and burn infected animals.....Hog cholera has become epidemic at Bayside, Long Island, and in its vicinity. Several hundred hogs have died from the disease within a few days, one farmer having lost 30.....

Crops & Markets.

SATURDAY, May 8, 1886.

Late cables from the United Kingdom have been quite favorable to the prospect for all growing crops, especially wheat, though the area under this is about five per cent less than last year. Red wheats are 6d. per quarter (1½c. per bushel) dearer than a week ago. At Paris the prices of wheat and flour have been higher and firmer. Growing French wheat doing well. Wheat in Central Europe has had fine weather; but liberal sales in Austria and Hungary have depressed the market. France has doubled her import duty on oats, raising the tax from two cents to four cents per bushel.

The Australian wheat crop is a small one this season. Estimates from Melbourne, March 10, are as follows for colonies mentioned: Victoria, 10,433,000 bushels; South Australia, 5,161,000; New Zealand, 4,250,000; New South Wales, 3,400,000—making a total of 28,244,000 bushels for these colonies. The estimated surplus for export is 5,540,000 bushels, which it is assumed will be needed by New South Wales, Queensland, Tasmania, Western Australia, New Caledonia, Fiji and the South Sea Islands.

Reports received last week from the agents of the McCormick Harvesting Machine Co., Chicago, estimate the area sown to the spring wheat crop as compared with last year. In Dakota, 115 per cent.; Minnesota, 100; Iowa, 100; Wisconsin, 95, and Nebraska, 92. The season has been rather backward in Nebraska, but as a whole the spring wheat crop of the Northwest is having a fine start.

Reports from every county in Ohio, Illinois and Indiana show that all crops are now two weeks in advance of the average spring season and are in a much better condition than at the same date last year. A summary of the reports shows that the average per cent. of the wheat crop in Ohio is 95, Illinois 94 and Indiana 94; oats in Ohio 90, Illinois 97 and Indiana 92.

Owing to the labor troubles throughout the country, and especially at Chicago, speculative dealings in wheat have been quite limited during the week. Comparatively little wheat has left Chicago by water, and very little by rail. Here prices have risen more than at the other chief receiving points. The visible supply fell off 1,300,000 bushels during the week.

In corn there was a decline of 1,700,000 in the visible supply; but the markets have been weak.

Oats, too, have been weak and lower, though the visible supply for the week ending May 1, showed a decrease of 35,000 from the previous week.

PEPPERMINT has gone up; but the report that it is to be "cornered" is emphatically denied by large dealers. A "corner" was much likelier six months ago, when, as we mentioned, the smallness of last season's crop was first realized.

Present prices of hops—nine to ten cents—offer little encouragement to growers. Hop yards in this State are said to be as far advanced now as they were last year on June 10—the earliest season since 1885. Then a frost on May 28 nipped the vines and there wasn't over half a crop, and prices went up accordingly. In the absence of frost the crop this year must be exceedingly heavy, though as many have abandoned or curtailed their hop yards, the aggregate may not be excessive.

The main object of wool-dealers now is to keep down prices until most of the new clip has been marketed—say, July 1. Labor disturbances at home, preventing manufacturers from buying heavily, and extremely low prices abroad for foreign wool, help them in this scheme. Here is a comparison of the market prices in London for the last five years:

	—1886.— Apr.	Feb.	'85. '84. June.		'82. '82 June.	
	d	d	d		d	
P. Phillip, av'g. grease	8½	9¼	10¼	12	11½	13½
Sydney, " "	6½	7	8	9½	9½	10½
N. Zealand, " "	8½	9½	10	12	11½	12½
Cape, " "	5½	6	6½	7	7	7
R. Plate, " "	5¾	5¼	6½	7¼	7¼	7¼

[Multiply these by 2, to get the price in cents per pound.]

The latest London advices say colonial wool is cheaper now than at any time in the present generation.

MARKETS BY TELEGRAPH.

SATURDAY, May 8, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is ⅜c. lower; No. 2 Spring, 1⅜c. lower. Corn, 1⅜c. lower Oats, steady. Pork, unchanged.

To the Kainit Trade.
ROBERT S. CARR,
Admiralit Ætstrasse 52.
TELEGRAMM-ADDRESSE.....ROBERT CARR.

HAMBURG, 1st of January, 1886.
The undersigned has the honor to inform all those interested in the KAINIT TRADE that he has been appointed by the STASSFURT SYNDICATE OF KAINIT WORKS, consisting of KÖNIGLICH PREUSSISCHES SALZWERK, STASSFURT, (The Royal Prussian Saltmine); HERZOGL. ANHALT. SALZWURK, LEOPOLDSHALL, (The Ducal Anhalt Saltmine); SALZBERGWERK NEU-STASSFURT, LOEDERBURG, (The Saltmine New Stassfurt); KALIWERKE ASCHERSLEBEN, GEWERKSCHAFT, ASCHERSLEBEN, (The Kaliworks Aschersleben), as their SOLE AGENT for the sale of this article to the United States of North America and Canada. As such, any orders will be carefully and promptly executed at the shortest notice and lowest possible current cost.
The demand for Kainit is steadily increasing, and the agricultural public, in becoming more acquainted therewith, is rapidly realizing the fact that the small cost of the article (it is the cheapest article for agricultural purposes) compares favorably with the results arrived at. As a standard Kainit is guaranteed to contain no less than 23 per cent. Sulphate of Potash and assuring all importers of the greatest care in executing orders entrusted to the undersigned, he is always ready to quote by cable or letter in reply to inquiries made direct or through his agents. Representatives for Baltimore; Messrs. PRIOR & VON COLLEN, 25 S. Gay Street, Baltimore. **ROBERT S. CARR.**

SOLID COMFORT

TONGUELESS. THE **"WONDER ON WHEELS"**
Self Guiding. Uses a wheel landside. Two horses instead of three. A ten year old boy instead of a plowman. No pole (except among stumps). No side draft. No neck weight. No lifting at corners. For the Young.

GRANDMOTHER.

S. P. SHULL.

Her hair that once was chestnut-brown
Is now a silver-gray;
The eyes that once were keen and bright,
Now shun the light of day.

The blushing cheeks of rosy youth
Are wrinkled now and pale;
The voice, once musical and strong,
Now trembles, weak and frail.

Although her youthful charms are flown,
Yet, in her life's decline,
She is more truly beautiful—
Her beauty more divine.

Her aged face reflects a light
That cometh from afar,—
A pure, celestial light that shines
Through Heaven's gates ajar.

She stands so near Life's outer shore—
Near to eternity:
So near unto the pearly gates—
Near to the crystal sea.

She almost hears the angels sing
Their new and wondrous song.
She waits to hear the Master's call
To join the happy throng;

When she may leave this world of care—
May lay her burden down—
And on her spirit's wings of air,
Rise to receive her crown.

MANY of the Cousins are working hard for the plow. It will be a very hard word that will escape so many sharp eyes. Some of the Cousins have written to find out what words are to be accepted. We will accept any word that can be found in Webster's Dictionary, or any proper noun in common use. There are many words which have two meanings—like hide. That means to conceal, or the skin of a beast; of course, we could only count such a word once. Now, take plenty of time, and pick out every word you can think of.

One of the older Cousins says she has taken flowers to fairs for many years, and the great trouble is to think out new designs and arrangements so that the flowers will seem new and out of the usual order of things. Who can send in some suggestions? Let all those who have ever helped at decorations tell us how they succeeded.

The grass in the parks is green and beautiful. Many city children get their only ideas of what the country is like from these green patches. The little folks have great fun on the grass when the policemen are out of sight. Sometimes the policemen who have little boys and girls of their own at home, seem to become near sighted, for they never shout "Keep off the grass!" as they do to the older people. In some of the smaller parks down in the business part of the city, people have walked over the edges of the lawns and killed out the grass. Workmen were trying to fix this the other day as I walked through the park in front of the City Hall. With an iron rake they scraped over the bare places and put fertilizer on them. Then they sowed Blue Grass seed and put up great signs to keep people from walking there again. A good lawn adds greatly to the looks of any house. When we have our own farms we will see that the lawn is well cared for.

I saw a box of turtles at one of the markets the other day. There must have been at least 50 of them. They were the common black mud turtles. I used to catch them when I was a boy. We have all seen them sunning themselves on sticks or stones at the edges of ponds. How quick the little fellows are to jump into the water when they hear a noise. We used to find box turtles in the woods. Some of the boys would cut their names and the year into the shells and then let the turtle go. I found one once five years after the date had been cut. There is no reason why these turtles should be used as autograph albums. These little turtles that I saw were probably sold to city children. Within 20 feet of the little fellows I saw a great turtle so large that it took two men to carry him. His mouth snapped in a way that made me glad I was not his neighbor. I suppose he has been made into soup before this.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: We are having very fine growing weather on Long Island. Papa has his potatoes in, oats sowed, and another bed of asparagus of three acres set out. We have now nine acres in all; we will soon have plenty to cut. I wish you could be here and help eat it. Please accept many thanks for the package of sweet peas you so kindly sent me. I shall try to give them good care. Papa is going to let me have some seed of the canteloupe, and I am going to try for the prize. Your affectionate niece,

LOU HALL.

[I should have to bring all the family with me to make very much impression on that great field.—U. M.]

DEAR UNCLE MARK:—Papa has taken your paper for a long time and likes it very well. I like to read the Cousins', letters, and I often think I would like to join the Y. H. C. I live on a farm of 100 acres, and go a mile and-a-half to school. We keep three cows and five calves. Papa keeps four and five head of horses; two head of work horses and two colts. We raise all kinds of fruit: apples, peaches, pears, quinces, plums, cherries, grapes, raspberries and currants. Papa made a strawberry patch last fall. Uncle Mark, I wish you and the Cousins would come in Summer and help to share some of the fruit with us. The neighbors always come to our house in Summer to share some of the fruit. Papa once said he would like to move, but the people advised him not to, they said if he ever sold out he would miss the fruit. Papa made two fish ponds. One of the fish ponds broke and let the water out. Some of our neighbors came over and helped to save the fish from getting lost. We put them in the Spring house in the ditch. There were 12 large fish and over 200 small fish. Thanks for seeds you sent us. We have not planted them yet. The seeds you sent us last year all came up, and were all very pretty. The flowers were of different colors—everybody that saw them thought they were so pretty. They would often ask us to save some seed of them. The people would often ask us where we got the seeds. I would tell them I got the seeds from the dear old RURAL NEW-YORKER. Your niece, E. EMERY.

Lamartine, Ohio.

[We would all like to come and eat fruit and visit with the neighbors. I guess you would miss the fruit if you moved.] U. M.

DEAR UNCLE MARK:—I live on a farm of 60 acres. Whenever I get hold of the R. N.-Y., I read the Cousins', letters the first thing. I am 11 years old. There is a creek called Chickamagua creek. We, that is my brother and I have found about two dozen Minnie balls since we lived here, which is one year. In our stony lands there are lots of arrow heads. We sent to the U. S. Department of Agriculture for some seeds, and received sweet corn early Minnesota, beet New Eclipse, carrot half long; bean Early Yellow six weeks; turnip; cabbage; lettuce; tomato and a few other kinds of seeds; but it would make my letter too long to name them all. We have two cows and three calves, two of which are heifers. I remain, your nephew, JOHN HOLM.

Chicamauga, Hamilton Co., Tennessee.

[Minnie balls and arrow heads are much better in the ground than in one's body.—U. M.]

DEAR UNCLE MARK: I have been reading the letters from the Cousins in the RURAL, and enjoy them very much. I ask you to let me join the Y. H. C. I am 13 years of age. I live on a farm of 16 acres of land. Pa has one cow, one horse and two pigs, and about 80 fowls. Mamma took off a hen with nine little chicks to-day. Papa received the seed distribution, and was very much pleased with them. My little brother raised a watermelon that weighed 30 pounds. We have a dog and two cats. The dog's name is Spot, and the cats are Lily and Jessie. We are going to have a nice flower garden this Summer. Mamma has some nice house plants. Our lily is going to blossom in a week or more. My brother George is knitting a net to go fishing this Summer. I should like to have some sweet peas, if you will let me.

FLORENCE L. HOFFMAN.

Wading River, N. Y.

DEAR UNCLE MARK: I wrote before and did not receive any answer. I got some sweet peas from you, and so I thought I would write again. I had a pig last Summer and sold it to Pa and got $5 for it. I raised 40 ducks last Summer and sold 37 and got $8. I have got 36 little chickens now. I have 200 old chickens. I get over 100 eggs a day. I helped plant the potatoes. Your niece, EMMA TAFF.

Christian Co., Ill.

DEAR UNCLE MARK: I was interested in Etta Shaffner's letter of Dawes Co., Nebraska, and hope she will soon write again and tell us more about the scenery in that part of this State. We live near Wisner, Cunning Co. Our farm joins the Omaha Indian Reservation which came into market two years ago. It is now quite thickly settled. January was a very stormy month with us. There were a great many blizzards from the Northwest. One of our neighbors had a hog buried in the snow for 45 days without food and when they got it out it was so weak it could hardly stand up; but they fed it sweet milk and i came all right and is now as smart as any in the pen. Another had one buried in the snow 47 days, and it is also smart now I think.

Your niece,

Wisner, Nebraska. ROZETTA BARTLEY.

[That hog had a long fast. No wonder it was weak. I am glad those blizzards get a little tired before they reach this part of the country.—U. M.]

LETTERS RECEIVED FROM Ella K. Barret; Wallie M. Coker; Erwin P. Allen; John C. Thompson; Herbert Damrell; Agnes Damrell; Amy B. Powers; Annie M. Hall,

The Finest Mechanism.

A CELEBRATED surgeon once said that he never stood in the presence of a body in the dissecting room without a feeling of awe and reverence, and well may every one do to remember the wonderful excellency of the house he lives in. The butterfly is beautiful and attractive in its aerial flight and its form is wonderfully adapted to its needs; but the human body is as much superior in its delicacy of construction and adaption to the needs of the being living in it as man is superior to the moth in length of days.

When this fine piece of mechanism gets out of repair, what is the best method to restore it to effective action again? Why is it that the majority of people are not content to take Nature's simple plan and follow it? Let us see what that plan is.

When the life-blood has made the circuit of the arteries and veins—before re-entering the heart, to be started on its circuit anew—it spreads over the surface of the air-cells of the lungs—a surface greater in area than the entire exterior covering of the body. Here the air inhaled by the lungs meets it, changing its color to crimson, and imparting to it new vitality. *Here kindly Nature has been ever a Healer and Repairer*; here modern science finds the proper place to help Nature in the most effective way. Taking the fact that the usual proportions of the mixture of the elements of the atmosphere are the proportions exactly adapted to the needs of the average man in health, and seeing that an extra effort is needed for the sick to repair the waste of vital force in the blood, a different proportion is made in a mixture of the atmospheric elements—a lesser quantity of Nitrogen is put with a larger portion of Oxygen. When this "Compound Oxygen" is used, the blood enters the heart with increased vitality. That organ receives a portion of that vitality from the blood in its passage, and sends it forth with more force and less wear to itself; the blood leaves on its circuit new deposits of vital force in every cell of tissue over which it passes, and returns to the lungs for a new supply.

The "Compound Oxygen Treatment" which Drs. STARKEY & PALEN, No. 1529 Arch Street, Philadelphia, have been using for the last sixteen years, is a scientific adjustment of the elements of Oxygen and Nitrogen *magnetized*, and condensed and made portable it is sent all over the world.

"*Compound Oxygen—its Mode of Action and Results*," is the title of a brochure of nearly two hundred pages, published by Drs. STARKEY & PALEN, which gives to inquirers full information as to this remarkable curative agent and a record of cures in a wide range of chronic cases—many of them after being abandoned to die by other physicians. The volume will be mailed free to any applicant.—*Adv.*

LINSEED MEAL.

ABSOLUTELY THE BEST FEED FOR
CATTLE, HORSES,
CALVES,
SHEEP AND HOGS.

This Meal is the product of pure sound Flaxseed, Linseed being its other name, and is the most nutritious of all feed, because it contains the largest proportion of nitrogenous substance.
It is almost needless to say that, in order to derive much benefit from the use of Linseed Meal, it must be fed in quantity. At least one-half of all an animal consumes may safely and profitably be LINSEED MEAL.
☞ Please send in a sample order or for circular and prices. Orders will be promptly filled by any one of the following parties:
Cleveland Linseed Oil Co., Cleveland, Ohio.
Toledo Linseed Oil Co., Toledo, Ohio.
Detroit Linseed Oil Co., Detroit, Michigan.

J. CUSHING & CO., Fitchburg, Mass.
JOHN KING, Norristown, Penn.

OUR GRANDFATHERS had a favorite expression: "Get the grubs out of your back in the spring of the year and you will be all right for another twelvemonth." What they really meant was that if you give your blood a good cleaning out in the spring, by the use of a perfect blood purifier, like Warner's safe cure, you need not fear that the year will find you under ground.

PILES. Instant relief. Final cure in 10 days, and never returns. No purge, no salve, no suppository. Sufferers will learn of a simple remedy, free, by addressing C. J. MASON,

PERSONALS.

GEN. CROOK says that he is not sorry to get away from the frontier, where he was forced to "hunt mosquitoes with six-mule teams."

LIEUT.-GOV. Ames, of Massachusetts, gave away trees last Arbor Day to any North Easton people who would set them out. He gives the town this year $2,000 to be used in planting shade-trees along the public highways, and has purchased 2,500 trees for that purpose.

SIR HENRY BESSEMER, the famous inventor of the Bessemer steel process, has recently invented a process of making steel plates covered with tin, which may by run out a mile long. The steel is to be run through the rolls and will come out plated with tin, and can be cut of any desired length.

VASSAR'S new president is the Rev. James M. Taylor, A.M., of Providence, R I. Born in Brooklyn, N. Y., August 5, 1848; graduated at the University of Rochester, N. Y., in 1868, and at Rochester Theological Seminary in 1871. Traveled abroad and was pastor of a Baptist church in Norwalk, Conn., for nine year, and for the last four a pastor in Providence. Vassar now has 271 "sweet girl graduates."

REPRESENTATIVE ST. MARTIN, of New Orleans, is the only Creole in Congress and the most cautious man in the world. During the rebellion, when General Lee was at the hight of his great fame, some one asked St. Martin what he thought of him. "Well," was the reply, "Beauregard speaks quite favorably of him!" Creoles think G. T. B. the greatest man America has ever produced.

Miscellaneous Advertising.

THE STREAM that does not run freely soon becomes stagnant. The blood in the spring and early summer months is thick and heavy and breeds pestilence and disease in the body, It is impossible to purify this blood unless the kidneys are put in perfect working order and kept so by the use of Warner's safe cure.

Buy the Best. THE EUREKA

A Debt that Can Never be Paid.

COLDWATER, Mich., Oct. 25, 1885.—Four months ago I was paralyzed and entirely blind, from kidney and liver diseases. I was unconscious for over two weeks. Physicians said I was incurable, and waited daily for my death. My friends gave me Warner's safe cure, and within a few weeks paralysis left me, bloating went down, enlargement of the liver subsided, and I became well, and owe my life to Warner's safe cure.—MRS. RUTH BROWN.

SEDGWICK STEEL WIRE FENCE

Is the best general purpose wire fence in use. It is a **strung net-work without barbs.** Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is better than boards or barbed wire in every respect. Give it a fair trial; it will wear itself into favor. The **Sedgwick Gates** made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working **all-iron automatic or self-opening gate,** and the neatest cheap iron fences now made. The best **Wire Stretcher, Cutting Pliers and Post Augers.** For prices and particulars ask Hardware Dealers, or address, mentioning paper,
SEDGWICK BROS., Richmond, Ind.
EDWARD SUTTON, Eastern Agent, 300 Market St., Philadelphia, Pa.

Humorous.

A LITTLE boy, whose sprained wrist had been relieved by bathing it in whiskey, surprised his mother by asking, "Did papa sprain his throat when he was a boy!"

FATHER was telling his little son of the wonders of modern science; that they had learned the distance of the stars, and through the spectroscope had discovered what they were made of. Little son: "Yes, but how did they find out their names?"

A MAN who was not of much account himself was forever boasting of his ancestry. A plain farmer, tired of this nonsense, asked him why his family were like a hill of potatoes. He gave it up. "Why," said the farmer, "the best part of them are under ground."

A BROWBEATING counsel asked a witness how far he stood from the plaintiff when he was struck. "Just seventeen feet nine and one quarter inches," was the reply, "How came you to be so exact, my friend?" "Because I expected some fool would ask me, so I measured it."

"MAMMA, be late sappers bad?" "Yes, my child, very bad." "What makes 'em bad?" "Why, it injures the health to eat just before going to bed." "Oh! I thought may be it injured the health to go to bed right after supper." Johnny wasn't hustled off to bed as early as usual that night.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1895. NEW YORK, MAY 22, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Vineyard.

THE PEERLESS GRAPE.

SPECIMENS of the Peerless Grape, illustrated at Fig. 220, were sent to us early last October by the originator, Geo. W. Campbell, Delaware, Ohio, who thinks it in some respects the finest grape he has ever produced. Although permitted to overbear last season, the clusters were all perfect, or nearly so—neither loose nor crowded, and not a berry had rotted, though most other kinds did. As received, the color was light green, turning to a darker green when fully ripe. Skin thin, tough, with no bad taste when eaten close. Seeds, from two to four—mostly three—small and plump. Pulp quite large and firm, separating quite easily from the seeds. Juice not abundant, pleasant but not rich; free from all foxiness. Bunch long, slightly shouldered. Berries from half to five-eighths of an inch in diameter, adhering well to the pedicle.

Rural Topics.

Experiment Grounds of the Rural New-Yorker.

NITROGEN.—Upon the half acre which last year gave an unsatisfactory crop of potatoes under the RURAL'S trench-mulch system, there is now growing rye seeded to Timothy and clover. It will be remembered that a large quantity of potato fertilizer was used upon this half acre of poor soil—enough, it might be supposed, to feed half-a-dozen crops.

We are told that phosphoric acid and potash remain in the soil until taken up by crops, while the nitrogen is lost. As an experiment, nitrogen, at the rate of 100 pounds in the form of blood, nitrate of soda and sulphate of ammonia, was sown upon all of this land just before the first heads began to show, except on a belt seven feet wide through the middle. There was no rain afterwards in 10 days, so that the nitrogen mixture remained upon the surface without any effect during that time. A shower then occurred wetting the soil one inch in depth. In 40 hours afterwards it was noticed that all the rye, except that in the belt, was of a deeper green color, which, after another good rain several days after, was so intensified that the stakes marking the belt were no longer needed to show where the nitrogen was omitted.

MONARCH RHUBARB.—Two plants were received two years ago from the Messrs. Farquhar (Boston, Mass.) This year the leaf stalks were the largest we have ever seen, being fully 2½ inches in diameter. They were extremely tender, less acid than the Linnæus and fully as early. It is not always convenient for farmers to buy rhubarb roots. It is easily raised from seeds for 10 cents a packet. Seedlings vary greatly in size of leaf, stalks, earliness and quality.

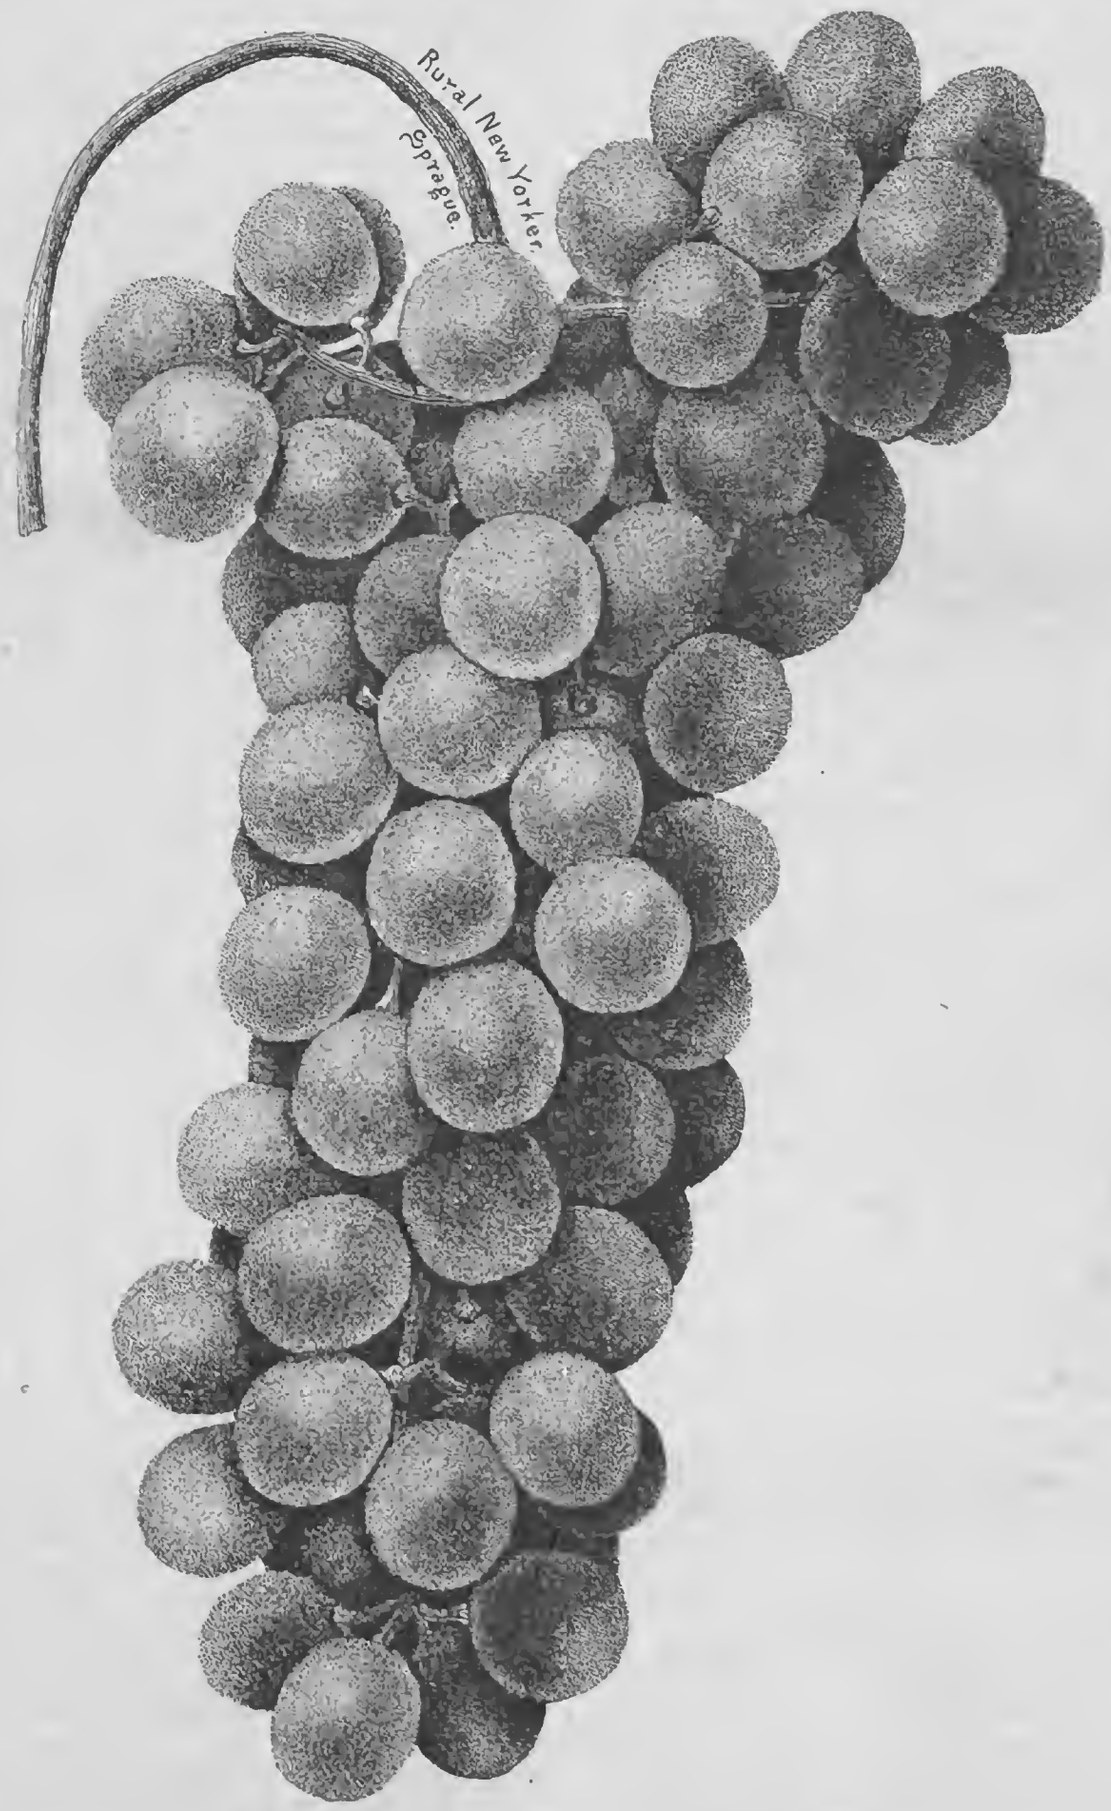
DANDELION.—Seeds were received last year of the French (cultivated) variety of this plant, which, though troublesome as a weed, is, nevertheless, valuable as a plant for early greens. Our plants, growing in clumps in the garden, were this year admired for their large flowers, many of which measured three inches in diameter, while they were as "double" as possible and as yellow as gold. The seeds were received from P. S. Chase, Brattleboro, Vermont.

MAY KING.—We have already spoken favorably of this early strawberry. Our plants have wintered well and are now as green and strong as those of any variety, while they are well covered with blossoms. The plants were received from John S. Collins, Moorestown, N. J., August 19, 1884.

MAMMOTH VERBENAS.—In late Winter we received plants of what Peter Henderson & Co. call their Mammoth Strain of verbenas, an illustration of which appears in their new catalogue. In 1884 Mr. H. raised the verbena "America" which, the catalogue says, far surpassed any variety previously in cultivation. From it, seeds were obtained to raise a large number of plants from which the advertised list of 14 kinds was selected.

One or these, "Century," is now blooming with us. The color is a brilliant scarlet with a well defined white center a quarter of inch in diameter. The single flower measures a plump inch in diameter. It is a great satisfaction to be able, as in this case, fully to support the claims made for new plants in seedsmen's catalogues. The verbena of old is a grand bedding flower, while judging by "Century," this Henderson strain is far in advance of anything we have ever seen among verbenas. The flowers remind us, at a little distance, of cinerarias, so large and brilliant are they. We shall speak of the other varieties comprising the set when they bloom in the garden.

EXPERIMENTS.—We have now 57 different kinds of new potatoes, 23 of new peas and 19 of oats above ground. Ten different kinds of alleged new varieties of sweet corn and 14 of field corn are in the ground. Our cross-bred wheats and hybrid wheat and rye plants are looking fine. We counted 40 culms from one root of the latter. The potato fertilizer experiments are favored with a fine start. Timely rains and warm weather have started the seed pieces at once, so that few will rot in the ground and we have now only to fear frost, which often visits us as late as the 20th, and drought. The trenches which received farm manure and potato fertilizer are ahead of the others, and there are 35 trenches, all fertilized or treated differently.



PEERLESS GRAPE. From Nature. Fig. 220.

Sheep Husbandry.

Notes from the Western New York Farm.

FEEDING LAMBS.

MANURE WORTH MONEY.

IF we would maintain the fertility of our farms, and not be content with crops that barely pay the cost of cultivation, we must in some way return to the soil as much of the elements of plant growth as is taken out by each succeeding crop. Luckily in stock feeding, a very large share of what is appropriated by the animal consists of those elements taken by the plant from the air or the water, so that if the excreta, solid and liquid, are properly cared for and returned to the field, but little loss is sustained, and when extra foods are bought and fed, especially those rich in the elements of vegetable growth, we carry to the soil more than was removed in the largest crops. This being true, it is only fair to retain sight of the value of the manure made, when we are figuring the profits of any branch of stock feeding.

We are led to these reflections by a letter from our good friend Richenbach, of Wayne County, Ohio. He says that in November, 1884, he put in 182 lambs at a cost of $465; from that time until April 11th, 1885, he fed them hay and grain worth, at market prices, $503, making an aggregate of $968. At this time he sold the lambs for $1,068, leaving him a balance of $120 for care, labor and interest, and he asks if this should be satisfactory. He had kept these lambs five months; the interest on the cost of the food or an average of half that time, and the wages and board of the person in charge, properly chargeable to the lambs, would amount to about $24, which leaves a clear profit of 10 per cent. on the money invested, which should be very satisfactory. But there was in this case a consumption of hay and grain to the amount of $503; the phosphates, potash and nitrates remaining in the excrements, if properly saved and returned without waste to the fields, could not be supplied in any other form at a cost of less than $230. (According to the experiments of Prof. Roberts, at Cornell, the manure would be worth $386). If we add this to the $120, cash profit received, we shall have $350, of which, taking the cost of care, interest and outlay for applying the manure, we should have left not less than $300, or about 30 per cent., and everybody knows that last year was about the most unfavorable for feeders ever known.

CAN HE DO BETTER?

Mr. Richenbach also says he put in November 4th last, 170 lambs weighing 73 pounds each, at a cost of $3.75 per hundred pounds, or $465.-38 for the lot. To these he has fed corn worth 35 cents per bushel; oats at 25 cents per bushel; oil-meal at $27 per ton; bran at $15 per ton, and hay at $7 per ton, and he has them to weigh 105 pounds each, and is offered six cents per pound. He asks if they would have done better with roots, and if he could have made more money by shearing them early.

He must make a fine margin of profit at the present Winter's prices of grain; but we can not but think he would have done much better by changing his grain ration somewhat, by feeding roots daily, and by shearing the lambs late in December or early in January. In the first place, oats at 25 cents per bushel cost $15.-62½ per ton; corn at 35 cents, costs $13.50 per ton; bran costs $15 per ton. Now, we should have fed a ration composed of 300 pounds of corn; 100 pounds of bran and 100 pounds of new-process oil-meal. While the oats are a healthy food, their relative cost is too high. The new-process meal would have cost several dollars less per ton, and would have been worth

absolntely more, for mixiug with the corn. Another reason for this charge would have been the value of the resnlting manure, that made from a ton of bran being worth more than double that made from the same quantity of oats.

THIS WAY AND THAT.

These 170 lambs, fed as before described, have made an average gain of 32 ponnds, weighing 105 pounds, worth six cents, or $6.30 per head. Now, had they been shorn early in December, fed in warm barns and with plenty of roots and the same grain, they would have gained the weight of wool removed and not less than 10 pounds besides, weighing easily 116 pounds each. But, although the wool would have made a good growth, being shorn, they would have sold for one-half cent per pound less, although we have just sold a lot of shorn lambs at six cents. The account would then stand as follows:—116 pounds at 5½ cents, $6.38; six pounds wool at 20 cents, $1.20; making an aggregate of $7.58 per head. Deducting from this 28 cents for mangels eaten, and $6.30 the price now offered, we have a net gain of just $1 per head for shearing, housing and root feeding. Surely this should be ample remuneration for the trouble.

To show that this is no imaginary case, we give a little experience:—Last Fall we put in a lot of cull lambs which cost, on an average, 75 cents per head. They were shorn in December, averaging 5½ pounds. They have just been sold at six cents per pound, and averaged 92 pounds in weight, bringing $5.52 each. Adding the value of the wool—5½ pounds at 20 cents, or $1.05—we have $6.57 each. Deducting the first cost, we have $5.82 to pay for keeping and for profit on the transaction.

When we add the valne of the manure made by the consumption of so much rich food, and its effect upon the yield of the crops to which it will be applied, we can only wonder that every barn in the whole country is not utilized for stock feeding.

Wheat has come through the Winter in fine order—very little is at all injured, and with a favorable season we shall expect a large yield.

While our manure is all drawn and spread where desired to be used this Spring, some of our neighbors are trying to worry theirs out now in the mud, poaching up the fields and nearly killing the horses.

Isn't it strange that farmers will never learn that every day's work done in Winter makes two days' difference now. This is doubly trne in the hauling and spreading of manure.

J. S. WOODWARD.

The Swineherd.

A COMPLETE PIGGERY.

PROFITABLE PIG RAISING AND FEEDING.

F. GRUNDY.

THE piggery shown at Fig. 222, is 20 feet in width, by 40 feet in length, with 10-foot

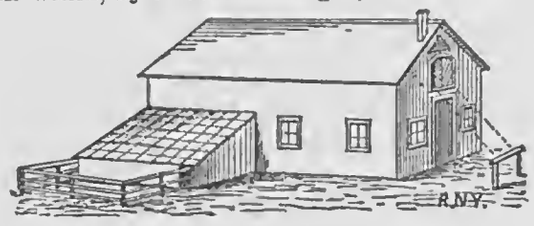


Fig. 222.

corner posts. The glass-covered extension on the south side, is 10x20 feet, and is, with the small yard adjoining, used exclusively for the little pigs. The floor is earth, graded about one-foot above the surrounding level.

On the ground-floor (see Fig. 223) are 11

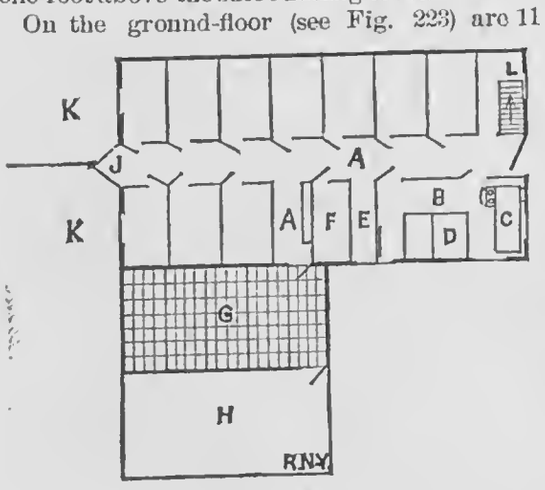

Fig. 223.

5x8-foot breeding pens, and a small hospital pen (F); a horse-power (E) for driving the sheller and feed-mill above; a furnace and boiler (C) for heating water, cooking feed, etc., and tanks (D) for meal, mixed feed, etc. The horse-power is sunk 18 inches in the floor to give space for the horses' heads below the ceiling. Between the boiler and tank is the pump which is provided with stop spouts for throwing water on either side. A four-foot passage (A) runs down the center of the building, and another connects this with the glass shed.

The second story (Fig. 224) contains the feed

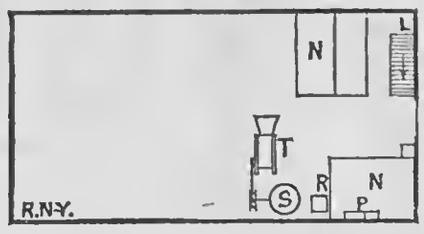

Fig. 224.

—corn, oats, etc. (N) and a corn-sheller (T) and feed-mill. A 10-bushel car (Fig. 225) is used for elevating grain, etc., into the loft. It runs on a track formed of 2x4 scantling, 18 feet

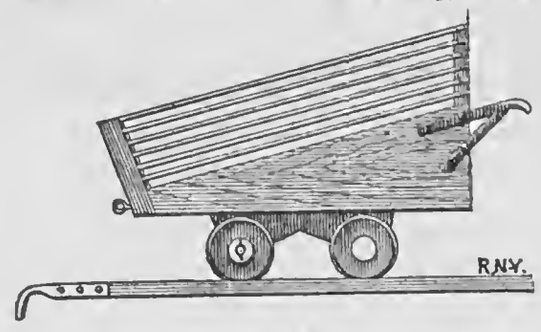

Fig. 225.

long, one end of which rests on the low scaffold in front of the building, the other being secured with hooks and rings to the floor just inside the doors. The car is drawn up and let down by means of a small windlass.

The owner of this piggery decided some years ago that the most profitable pigs are those farrowed early in the Spring and marketed before cold weather sets in in the following Fall, every particle of food eaten by the pig during this time being converted into pork, none being wasted in merely keeping up animal heat. He keeps 10 brood sows, five one year and five two years old at farrowing. They are bred to farrow about February 1. As soon as the pigs are weaned, the five old sows are fattened and sold, and the five young ones are turned on pasture where they run all Summer, living on grass exclusively. Early in the Summer he selects from his stock of pigs five of the best for brood sows, and turns them in with the old sows to live on grass, grow and develop strength and body. When Winter sets in, they are admitted to the breeding pens, and kept plentifully supplied with thin slops and light, bulky food up to the time of farrowing, the chief object being to satisfy hunger without fattening them. They are given the run of two large yards until about due to farrow, when each is shut up in a separate pen.

After farrowing, they are fed three times a day with boiled potatoes and beets, mashed and mixed with bran and corn meal, to which are added skim-milk and sufficient water to make a rather thick slop, which is fed warm. The amount of corn meal is gradually increased, and in about a week it forms the principal part of their food.

A small door in each pen is left open so the little pigs can run out in the passages and into the glass shed, where they frisk about and enjoy the warm sunshine. A low trough placed in the passage leading to the glass shed, is kept supplied with fresh milk and corn-meal slop. They soon learn to make this a part of their daily food, and it increases the rate of their growth fully 10 per cent. They spend the greater part of every sunny day in the glass shed, racing about or lying at full length enjoying a sun-bath. A nicer, smoother, jollier lot of fat, little pigs it would be difficult to find anywhere. On warm days they are allowed to run in the small yard adjoining the glass shed. After weaning, they are divided into two lots, the sows in one and the barrows in the other, and turned into adjoining clover pastures. They are given all the corn-meal—fed dry—they will eat; are kept constantly supplied with plenty of fresh water, and have a maple thicket for shade in hot days. So well do they thrive under this treatment that when they are brought to market, about November, any ordinary pig feeder would be willing to wager that they were fully 20 months old.

The owner holds that early pigs can keep healthy and grow rapidly only when provided with, 1, warm, dry beds; 2, plenty of rich food; 3, a warm, light, *sunny* place, perfectly protected from cold winds, to exercise in. The breeding pens supply the first; the well-fed dam and milk and corn meal the second, and the glass-covered shed the third.

Christian Co., Ill.

The Poultry Yard.

BRONZE TURKEYS.

OF the six or eight varieties of turkeys, there is a greater demand for the mammoth Bronze than for any other, as birds of this breed are the largest and most profitable, and can be easily raised. I have raised gobblers to weigh 40 pounds and hens 22 pounds, although the average weight of the Bronze gobbler is 30 to 35 pounds, and of the hens, 18 to 20 pounds. I knew of one gobbler that reached the enormous weight of 45 pounds. Three-fourths of our farmers continue to raise common or mixed breeds. Why will they not see that if about the same amount of feed and attention is given to birds of the Bronze kind, they would attain far more weight and be more salable in every way? The demand for them is increasing every year. Last season I shipped 25 gobblers and about as many hens, the gobblers bringing, on an average, $5 each, and hens $4. Now, the common breeds weigh from 10 to 15 pounds apiece and sell at from 10 to 18 cents per pound. Need anything more be said to show the superiority of the Bronze for profit?

I have frequently heard persons say, "Turkeys are delicate and hard to raise." I believe that with proper care and attention, young turkeys are no harder to raise than young chickens. In the Summer of '84, I hatched 63 Bronze turkeys and raised 60, losing only three in all. They were separated into three lots and put with three hens that had just hatched chickens. Each hen was kept in a large, tight coop with a board floor and glass door in front. The young turks were not let out in the mornings until the grass was dry. Their runs were on high ground covered with grass. Their coops were cleaned every morning, and the hens were housed immediately if a storm appeared, and were never allowed to get wet. I kept them in this way until they were eight weeks old; after that they were allowed more liberty. Their feed when first hatched should be the yellows of hard-boiled eggs; then, dry curd with a little pepper mixed in it, or a finely chopped onion. An excellent food is middlings made into bread the same as bread for family use, and then soaked in milk. When young, they should be fed often, but they should not be fed any more at a time than they will eat up clean.

Lice destroy hundreds of young turkeys every year. After the turks have passed all other juvenile dangers, these pests are always found in the quills on top of the wings. The application of a very small quantity of fresh lard will kill them instantly. I have sometimes dusted sulphur between the quills. Remember, a *very small* quantity of *either* is sufficient. I have known persons to overdo the matter, killing the lice and the turks too. Don't wait until you see the little things drooping; examine their wings frequently. There is no difficulty whatever in raising turkeys if they are kept dry, clean, and free from lice. Bronze turkeys ordinarily lay 18 eggs or more before wanting to sit; the second or third time they lay from 13 to 15 eggs, although I have known hens to lay 60 eggs in one season. Turkeys mate about the first of March, and usually commence laying the latter part of March. The nests for sitting should be made of grass or wheat straw on the ground, and should not be exposed to the hot sun and rain. In this way I have had every egg to hatch. The best time for hatching is in May or June.

E. J. CHANDLER.

Chester Co., Pa.

A FINE HOUDAN EGG RECORD.

HAVING come to this State for my health three years ago, and settled here a year and a half since, and started fruit growing, last Fall I added poultry keeping to the business. I started with six breeds of fowls—Wyandottes, Plymouth Rocks, Langshans, White Leghorns, Houdans and Black-breasted Red Games—obtained from the best fanciers of the country. I intended to keep only two varieties, but wanted, by actual experience, to decide which two I preferred. I have four Houdan hens which are exceptionally fine layers. They were all hatched in May, 1885, and on March 11 last, I separated the various breeds into breeding pens. From that date to April 17, these four hens laid 125 eggs, all quite large and pearly white—125 out of a possible 148, if each laid an egg a day for the 37 days. The lowest number of eggs laid in any single week was 21; the highest 25. This is away ahead of anything else in the same line around here. The great production is in the breed more than in the feed, in this case at any rate; for being a novice in poultry keeping, I do not know enough of the business to push the hens to their utmost capacity. I feed no "eggine" or any other stimulating food; they get no more than ordinary feed and care, the same as the other chickens. Who can beat this record—four Houdan hens lay 125 eggs in 37 days, or at the rate of 310 eggs a year apiece!

Cañon City, Col. F. E. S.

A HOME-MADE BROODER.

FOR the design of the home-made brooder illustrated at Fig. 217, we are indebted to our old friend J. H. Griffith, of Queens County, Long Island. Four pine boards one foot broad and 13 feet long, are set on edge, two serving as sides and the other two as interior partitions. The end pieces are six feet long. Wire net

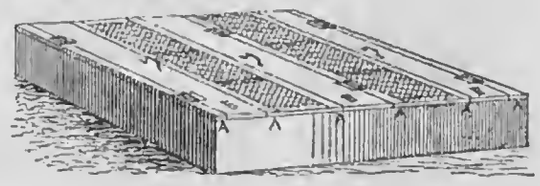

Fig. 217.

coverings are fastened to strips, A. A. A. A. A. A. A., which are hinged to the doors B. B. B., each six feet long and one foot wide, the center one of which is for feeding purposes. Under this is a cross partition, which with the longitudinal boards, cuts up the whole into six compartments each two feet wide and six-and-one-half feet long. Through the central door food can be introduced into all the compartments.

A MAKE-SHIFT HEN PEN.

"IF a hen I intend to set, steals her nest," writes friend Holmer, of LaCrosse Co., Wis., "I inclose her in a triangular pen made of three pieces of board a foot wide, and two or three long (See Fig. 214.) A piece of leather is nailed, hinge-fashion, over one angle of the triangle. A piece of rope or a leather string put through holes bored in the third piece of board and in the upper front edge of the others, serves as hinges for the door. Bits of shingle or waste lumber form the roof. Instead of binding the sides together with leather and strings, the device can be kept together by means of pins thrust into the ground."

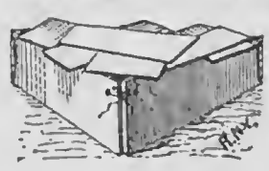

Fig. 214.

A HAWK TRAP.

MR. J. KRUPP uses an arrangement like that shown at Fig. 221 for catching hawks. The base is formed of a stout board, about the size of the head of a flour barrel. Two dozen steel wires, about as large as a telegraph wire,

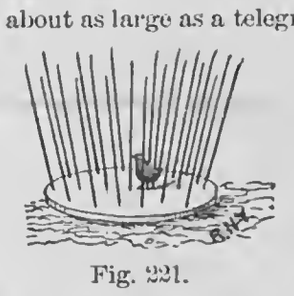

Fig. 221.

are fastened into the board, slanting as shown in the illustration. The upper ends are sharpened on a grindstone. In setting the trap, grass or dirt should be placed over the board to hide its color. The noisiest chicken on the place is tied in the center of the wires and left for the hawk. Do not polish the wires. When the hawk swoops down for his breakfast he gets a very sharp reception and receives a taste of his own argument.

REMEDY FOR LICE ON POULTRY.

WHEN we set a hen we sprinkle her and the nest liberally with powdered sulphur. If the hen is very lousy, we blow her feathers full of Persian Insect Powder. If these preventives are from any cause neglected, when the chicks are taken from the nest and found to be lousy, we rub their down full of the powder and give another dose, if necessary, in a few days to kill any that may have been hatched since the first application. This plan has been very successful. We are using brooders this season (our own make) and find the labor of raising chicks much less and the mortality almost nothing, having lost only one chick this season.

York Co., Pa. T. B. HOOVER & SON.

A PROLIFIC FLOCK.

I HAVE 19 hens that have averaged 12 eggs a day for the month ending April 26. They are Plymouth Rocks and Dominiques mixed. I fed them three times a day—breakfast, shorts and bran, equal parts, scalded; dinner, oats: supper, corn. I leave them the feed for half an hour, then take away what hasn't been eaten. They are shut up in stormy, cold and windy weather.

Farm Topics.

WATER IN CULTIVATION.

THOMAS MEEHAN,
Editor of the Gardeners' Monthly and State Botanist of Pennsylvania.

NOTWITHSTANDING the great advance in the science of vegetable physiology, and in the practical application of its principles by a few successful cultivators of the soil, to the ma-

jority the exact place of water in cultivation is yet in a great measure unknown. They understand that wet ground is unfavorable, but the want of knowing why it is unfavorable leads to innumerable errors in practice, and is the cause of an annual loss to the country as compared with which the fearful figures of losses by insects, as furnished by entomologists, pale into insignificance. Nature swims in abundance, insects take a few buckets from the pool, keeping it from an overflow, but water where it is not wanted, often takes the whole, leaving us "high and dry." For instance: every farmer knows that Winters in which his grain fields are covered by snow the whole season are more favorable to abundant harvests than seasons when there is little snow. Some attribute this to shelter from frost, some to protection from sun, others to some fertilizing property in the snow itself. Each or all may have some beneficial influence, but the chief good comes from the counteraction of too much water in the soil. Plants draw out in wet ground by the action of the frost, the weight of the snow presses it down as the melting water from the surface thaws the ground beneath. But "drawing out" is in proportion to the water in the soil. Earth in itself, does not freeze; it is only the water that is in it that freezes. When a clod freezes dry it falls to powder. The expansion of earth by the freezing of the water that is in it, is upwards, and the plants are lifted up by this expansion. When the thaw comes, the liquid mush, being heavier than the root or plant, goes first into the space that the root ought to fall into, and hence the latter is left to dry or perishes in the sunlight and air. In dry ground, where there is little water to freeze, plants are not thrown out. On a sand-hill no such thing as thawing out can occur. Thus we see that the light crops of grain that follow Winters with little snow, are traceable to the drawing out and total loss of some plants, or the partial drawing out and proportionate injury to the plants that are left, and which give only a proportion of a full crop.

In the Old World, where farming is expected to be carried on by the same person on the same tract for years, this fact has been recognized, and a system of under-draining has been resorted to. Under-draining has been practiced in land comparatively dry, and with profitable results. Crops double, and even treble the size, have been obtained on land after under-draining. In our country, where an owner seldom knows how long he may hold ground before he is tempted to sell or vacate, the first expense of under-draining can rarely be thought of. Not often would he get back the first cost, with interest, under several years. But very much oftener than at present, he might surface-drain by plowing into ridges, or making open furrows through the flats. He would do so much oftener than now, if he did not forget that surplus water in the soil is at the bottom of most of his losses by short crops.

Aside from this, it is not well understood that water is of no value as food for plants. Its chief use to vegetation is to keep the parts cool—to keep a plant from drying up. Heat is evolved by the processes of life. Transpiration carries off the surface heat, just as perspiration keeps a man's body cool. A live tree trunk in summer time will be found quite cool, while a dead trunk alongside will be warm or even hot, and in Winter, when a thin snow on yucca, or other living leaves, will melt, on dead leaves, or dead wood, that have no living heat, it will stay till the sun or an advance in the temperature drives it away. Water is necessary therefore only as it can pass tissues, and transpire through the surfaces. It is not necessary that water absolutely in its pure liquid state should be in the soil for the plant to get all it needs. Tons of water, as we know water, are taken from earth from which we could not extract one drop by pressure—and we find by experience that the less of what we call water in its popular sense we have in the soil, the better for the health of the plant. This comes about from the food of plants being chiefly of a mineral character, and the necessity of oxygen in properly preparing food for the plant. Though actually in water, roots have to employ oxygen in preparing food. Water is capable of taking up a small portion of oxygen; when it has taken this small portion, it will take no more; when all the water is relieved of its oxygen the plant will die unless the water has the chance of absorbing more from the atmosphere in proportion to that used by the plant. A hyacinth could not live in a hyacinth glass only that the water absorbs from the atmosphere the oxygen it loses by root consumption. This has been proved by actual experiment. "If the water in which the roots of a plant are immersed be contained in a closed bottle only partially filled with the water, while the remainder is occupied by atmospheric air, the oxygen in this air will slowly diminish, being absorbed by the roots through the medium of water, the roots extracting it from the water and the water absorbing it from the air. If carbonic acid, nitrogen or hydrogen, is substituted for the atmospheric air in the bottle, the plant droops and dies in a few days." (Johnston's Lectures).

We see from all this that, while it is important that there should be moisture in the soil in order that there should be a circulation of the plant juices, it is quite as important, if not more so, that there should be always a supply of oxygen about the roots. They cannot get much when water surrounds them, and then only at second-hand. The soil is, therefore, in the best condition for plant life when it has no water in its popular sense—it should rather be in a gaseous than an aqueous state.

The "moral" of all this is, as the story books would say, that water serves two purposes in plant culture: first, it gives that moisture to the earth by which the plant can get of the liquid sufficient to supply the waste of transpiration, and maintain an even temperature, and, secondly (what is of far more importance), it drives out of the soil the waste air—the air that has been deprived of its oxygen, and, when the water itself sinks away by its own weight, a new supply of fresh air takes the place of that which the water dislodged.

Is it not strange how long it takes the cultivator to apply the facts which the scientific investigator makes so plain before him? Go where you will in greenhouses, you may see the water-logged pot that never dries, and the sickly plant, the grower never for a moment supposing that it is dying from root-suffocation, and we may go into the large establishment of the intelligent cut-flower grower, and find his benches of roses, bouvardias and carnations unprovided with any drainage; but fortunately they are kept in fair health by the slower process of moisture evaporating from the great flat surface, instead of the more rapid passage which good drainage affords. They seem to prefer to learn by horny-handed, thick-headed experience, costing no end of brains and thousands of dollars in money. After years of tussling with ten inches or a foot of soil in a bench, they found six inches or less in a bench better. No one could explain why? The reply is, "Well, we find it better!" They still kept to their solid board bottoms, that admitted of no drainage. Now they have found that slatted bottoms are better than the solid boards, and still no one knows any more than that it is better "because it is."

What an immense advance there will be in profitable culture when it comes to be understood everywhere that the oxygen in the air is essential to the roots of plants, and that the rapid drying out of the soil, so long as it retains some moisture, is the best way to re-oxygenate the earth.

Farm Economy.

CRUSHING BONE.

Mr. Charles E. Burnap "uses" the device shown at Fig. 226 for crushing bones for his

Fig 226.

poultry. It consists of a strong sugar barrel with three staves cut off one-third the distance from the top. It is then partly filled with small stones packed solid. At the top of these is placed a large flat stone fitted tightly to the barrel, with the top coming up even with the bottom of the place cut out. Upon this flat stone bones can be crushed, the sides of the barrel catching the fragments, thus saving much that would otherwise be lost.

GRAIN BAG HOLDER.

At Fig 227 we show another grain bag holder, different from the one illustrated last

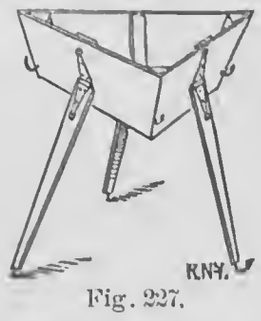

Fig. 227.

week. This one is used by Mr. Luther Shute. It is made of three pieces of half-inch basswood boards. Upper edge 23 inches long and lower edge nine inches. These pieces are fastened together at the corners by means of hardwood pieces, as shown. The three legs are three feet nine inches long, fastened on by means of strap hinges, so that it will adapt itself to bags of different length by giving a a greater or less spread to the legs. The hooks are formed of wrought iron nails driven into the corners and turned. Nails driven into the legs and sharpened hold the implement from slipping.

Horticultural.

MODERN HORTICULTURAL NOMENCLATURE.

T. T. LYON.

With the rejuvenation of horticulture within the past 30 or 40 years, important changes have occurred in modes of thought and practice, to a few only of which do I propose to invite attention. Then, the orchardist, perchance, would have no alternative but to plant the seeds, grow them up to trees, and thus provide for the planting of his orchards. Nurseries and nurserymen's catalogues were decided rarities. "Agents" and "tree peddlers" and especially the venders of blue lilies and roses, tree strawberries, curculio-proof plums, iron-clad peaches, Russian apples and mulberries, and all that tribe, were all unknown, as were the great mass of of our present horticultural literature, with the consequent necessity to write and re-write, print and reprint, study and restudy the catalogues and lists of to-day.

Serious as the mere fact of prolixity has now become, however, it ceases to be of importance when compared to the novelty mania, with its burdensome tax upon the time, as well as the purse, not only of nurserymen, but of the general public as well. It can no longer be said that misleading names are the outcome of innocent self-deception, or that they are mainly harmless. The new rose, Her Majesty, may, for ought we know to the contrary, be superior to any and everything in its way that has preceded it; but who dare deny that so pretentious a name was not chosen as an aid to its introduction and sale; or that quite as much use is not being made of the name as of its alleged merits in the way of advertising. The same to-day, as the rule, may with great apparent reason as well as probability, be charged as the motive for the selection of such titles as General, President, King, Emperor, Queen, etc., etc., while Beauty, Favorite, Prolific, and a host of other prefixes and suffixes subserve the same object—an unwillingness to wait till the variety shall win a character for itself, and a purpose to impose a character upon it which, too late to serve the purchaser, may, and as the rule, surely will prove spurious or at the least misleading.

To illustrate: I can see no good reason why all should not tacitly yield to the wish of the owners, and drop the name Comet as applied to the Lawson Pear, save that, being more or less sensational, it may be used to withdraw attention from its actual worthlessness, and thus promote the sale of trees.

The introducer of Meech's Prolific Quince by the use of the epithet "Prolific" becomes liable to the suspicion of a purpose to urge its sale upon the assurance of superior productiveness—a claim which will quite possibly entrap the ignorant; although those better informed will usually understand (as has been very properly said, recently, by J. J. Thomas) that prolificacy is quite as likely to prove a fault as otherwise. To the public it is sure to be only Meech.

I know nothing of the Golden Queen Raspberry, now widely and temptingly advertised; but the mere selection of such a sensational name, in defiance of the tendencies of the day, begets the suspicion that it was chosen to supply a factitious basis, on which an advertising reputation might be made up—a motive which seems to have heretofore induced the selection of such names as Legal Tender, Prince of Berries, Pride of the Hudson and numerous other similar ones.

South Haven, Mich.

Miscellaneous.

SHORT PITHY PARAGRAPHS.

Poultry and Sheep need sulphur, not only to prevent disease, but to make wool, eggs and feathers. For poultry and hogs, add charcoal. Keep your poultry houses well littered with sawdust. Occasionally dust sulphur and ashes over the perches to prevent vermin and scaly legs. Keep a box of ashes in one corner.

As Treatment of Diseases: for bloat or hoven in cattle, a cloth wet with strong brine laid across the small of the back will give relief. If cows are poor and weak, feed corn a few weeks before calving to give strength to expel the afterbirth. If fat, put them on dry feed 10 days before calving to prevent milk fever. For milk fever, give spirits of niter and quinine in small and frequent doses. Keep the patient well covered with blankets to prevent chills and congestion. I have cured the worst form of foot-rot in sheep in a week's time by driving them twice a day through a trough filled with lime, blue vitriol and water, mixed to a thin paste. Water must be added as it dries out. For scab, tobacco dip is safest; arsenic and carbolic acid are effectual, but dangerous. For distemper in horses, a teaspoonful of camphor gum twice a day, corn fodder, bran mash and blankets. For spavin use iodine, quicksilver and corrosive sublimate, equal parts, mixed with lard. Remove the hair, rub in the ointment for four consecutive days in eight or ten days, and the spavin will disappear. For strains and lameness keep on wet bandages. For ringbone, sweet oil, four ounces, turpentine, two ounces, oil of stone one ounce. Apply three times a day; fasten a bar of lead just above the enlargement. For scratches, wash with soap suds; add 20 drops of carbolic acid to a pail of suds. For sweeny, rub well with a bacon rind. For bots or colic, give sweet milk to which has been added a shovelful of wood ashes; after this has settled pour the milk off. If for bots, add one pint of molasses. Repeat the dose if relief does not speedily follow—a safe and efficient remedy. For saddle or collar sores, brush on some white lead paint. To prevent sore shoulders, wash well with cold water at night; keep the collars cleaned and well oiled. For poll evil or fistula, wash pure potash into the sores—sure cure. For hoof-bound, keep the hoof wet with strong brine; have the shoe made so as to expand the foot. Most blacksmiths shape the shoe so as to make the hoof contract or crowd inwards at every step, hence corns and hoof-bound. Buy stock as a rule, when everybody wants to sell, and sell when everybody wants to buy.

[R. N. Y.—Some of the modes of treatment recommended above for several of the ailments mentioned, differ from those prescribed by the most skillful and successful veterinarians. The methods of the latter have in every case been given from time to time in the Rural during the past year, and repeatedly in previous years, so that there is really no necessity for repeating them here. We do not think it right to exclude from a farmers' paper all mention of practices and beliefs common among a large number of farmers, simply because they do not coincide with what we think best ourselves. A word of caution, however, is not out of place, where the health or life of a prized animal may be affected.]—

To Preserve Fence Posts, dig a pit in the ground, that will hold 50, 100 or more posts of any size you want; break up freshly burned unslaked lime, put a layer on the bottom of the pit, lay in your posts until full; then pour on water to slake the lime; add two pounds of sulphuric acid to a pail of water; cover up quickly with boards and then with dirt; tramp down to keep in all the heat and steam; let them lie one week before opening. I have known elm posts thus treated to be good and sound after 18 years. Another way, with a cloth swab tied on a stick, apply sulphuric acid to the parts of the posts that will be a foot above and below the ground. Afterwards give a coat of linseed oil, or oil and resin, hot or coal tar. Another way, apply common coal oil to the entire post after swabbing it with the acid, as above. This is cheap and lasting. To make a cheap and strong post-and-rail fence, take number eight or nine wire; tie it around the post two feet from the ground; bring it up and make a loop for the ends of two rails to slip in; then tie around the post again, make another loop for the top rails; drive staples to the wire at the back side of the posts. This will make a cheap, strong fence to turn horses and cattle too; or three barbed wires can be added at the bottom to turn small stock. In making all wire fence, have the brace come about the middle of the end post, so that the post can spring as the wire contracts; if put at the top of the post it will draw out and loosen the whole fence.

To Keep Cider Sweet for years, add one ounce of salicycic acid to 40 gallons of sweet cider; dissolve the acid in hot water in a crock (don't use iron); let it stand on the stove two hours, or until dissolved. The acid is good for rheumatism and dyspepsia, and is kept by all druggists.

Morrow Co., Ohio. C. W. Carpenter.

[Salicylic acid is not now used as a food preservative nearly so commonly as it was a few years ago, as it is thought to be injurious to the stomach.—Eds.]

PITHS FROM SUBSCRIBERS.

A. C. Carpenter, of Minnesota, says that some contend that any journal is worth its

subscription price, and that you cannot read it a year without finding some useful hints, etc. But Mr. C. takes this view of the general proposition, "Here is a gold mine. There is $100 worth of gold in it; but it is worth $1,000 to dig it out." Therefore the mine is worthless."

My vineyard of Niagara and Concord grapes was almost an entire failure last year, on account of the injury done the vines by the extreme cold of the Winter before last. To avoid any such mishap again, I laid down the vines from the wires last Fall, and they now promise a great crop. C. P. W.

Hillsborough Co., N. H.

The cow that will suck herself is generally the best in the herd. If it was not for this fact, very few of them would be kept. When measures are taken to keep the cow's head away from the bag (and that is the only sure remedy), the cow must be kept in a stall by herself, as the frame on her neck will not let her head into a stanchion. It pays better, though, to keep a good cow in a stall than it does to keep a poor one in a stanchion.

Jefferson Co., N. Y. T. H. S.

In the Summer of 1884 several peach trees bore a medium crop, but almost without exception, the peaches were wormy. The apples were just as bad. Last May I had corn-cobs soaked in crude petroleum and tied in all the trees. We had an abundant crop of peaches and I don't remember one dozen to have had worms. I think small, wide-mouthed bottles hung in trees with the petroleum in them, might be better. In the Spring of 1884 I tried an experiment with a scrubby peach tree, that was about two feet high and 1½ inch in circumference. I removed the earth from the roots and put in a peck of ashes over which I poured two gallons of boiling water, and then put the earth back. Now the tree is fully 12 feet high and as thrifty as any tree on the place. The earth was removed this Spring, but no trace of worms could be found.

Orange, Va. MRS. J. E. M.

Some 30 years ago Horace Greeley spoke at the Indiana State Fair, and expressed surprise at the small size and inferior quality of the horses on exhibition. The average farm horse then was gaunt and spindling, averaging 13 hands high. It was then held that a colt could make its full growth without regard to care or feed. Colts were made to live on scant pasture in Summer, and straw stacks in Winter. Lately they have had better care and larger breeds have been introduced. The Hambletonian, Clevel,nd Bay, Clydesdale, Percherons, and other breeds are found everywhere. Raising good horses pays as well as any other branch of farming. It is to be hoped that with the improvement of the "general-purpose" horse, the gambling race course will not be made, as now, the chief attraction of our State and county fairs. S. W. H.

Madison Co., Ind.

I have been much pleased with artichokes as a food for hogs, especially in the Spring, or as a food for brood sows. We had a plantation near an old piggery which gave excellent satisfaction. Since the hogs were moved to new quarters we have fed no artichokes, but we shall put out a small plot, as I think they pay well. PROF. S. JOHNSON.

Lansing, Mich.

In many cases where hog cholera is given as causing the death of hogs, I think the trouble is due to kidney worms. The animals are sluggish and seem to grow weak behind. A dose of sulphate of iron or of turpentine will help matters. L. J. T.

Canon City, Col.

I have been bothered very much by my hens eating their eggs. I think I have at last found a sure remedy. A gentleman was at my place some time ago and we were speaking of this trouble with hens. I found we had both come to the conclusion that if the nests are kept nearly dark there will be no loss. I proposed to darken my nests by placing them in a separate room with but little light, and that not to shine into the nests. My hens are a cross between the Plymouth Rock and Brown Leghorn. They are good layers, rather tardy about sitting, and almost too timid. Black predominates among them. L. M. M.

N. Ferrisburg, Vt.

I was recently struck with a statement in coal mining. The miner filled three ton cars, employed his own driver, found his light, tools, powder, etc. After these expenses, it netted 10 cents per ton. A farmer places a tenant in absolute possession to pay as rent half the gain or in many cases two-fifths. The tenant has all the comforts of life, his cattle and horses' increase and profit, his poultry, vegetable garden, orchards, fuel, etc. What a contrast with the mine and its worker! There is discontent all over the country. Business languishes, and all must economize. The products of the soil remain unconsumed, or are sold at prices which will not pay the cost of production. Capital is settling into the hands of the few, while the many become poorer. A halt must be called. We must begin just where capital began. It created laws for its purpose, now farmers must take a hand. Too many of our legislators are lawyers. We want laws that the common people can understand. The rich have gained their wealth by the labor of the poor. Let all bear the burden alike. Honest labor can never fill its proper place till it forces itself into it. The war began the work by raising the most degraded labor. We must carry the work on. The Rural is right in the matter. Farmers have the power to work out their own freedom. J. B. B.

Talbot Co., Md.

I have just finished a machine that gives me great satisfaction. I can now crack all my corn and grind my oyster and clam shells. This is quite an item to one, like me, in the poultry business. I took an old mowing machine and took off one wheel and fastened a sweep to the other wheel, lengthened out the shaft, put a horse to it and with a Wilson $5 mill can grind all I want. It will save me much hard work. J. R. L.

Coxsackie, N. Y.

New seedling potatoes should be raised on clay loam, for on such soil they run a hard test, and if there is any bad blood in them it will show itself about the second year. Sandy soil is deceitful. Sandy soils give you beautiful Burbanks and Empire States, but on our clay loam in our valley they look like cows' horns, and grow very coarse, and will never do for our soil. O. H. A.

Charlotte, Vt.

Rev. Richard Nott of Charlotte, Vermont says; "I have heard "thin-skinned" folks express the belief that the Rural editor has not any feelings from the habit he has of "sitting down" so independently, callously, defiantly in his paper on matters and things, measures and men. I incline to the opinion, however, that the Rural folks—from the Editor-in-chief down to the imp of the composing room, are all people of kindly sensibilities.

Experience is the first and best teacher for successful farming, and the Rural is next best. We need to learn what we can do ourselves and also what others can do. There is much in the way this experience is told. We had a cow choke with a beet. It stayed in her throat all night. We fixed two blocks of wood between the jaws of a wood clamp, so as to press on the beet without pressing the wind-pipe. I screwed the thing up and it started the beet so that I had no trouble in working it out by hand. We applied the pressure near one end of the beet so as to start it. This is much better than trying to smash the beet with a mallet or poking it down with a stick. A. B. E.

Manhattan, Kans.

I am getting out of patience with strikers. Most of them get far better wages than the majority of farmers can possibly hope to get; yet they go on agitating and depressing times still more. We live nine miles from a railroad, and haul our oats and corn that distance over rough, muddy, country roads, and then sell at 20 cents per bushel. What would these "strikers" do in such a condition? Some people never know when they are well off.

Hopeville, Iowa. M. T. A.

Tree agents are around here deceiving the people with Moore's Arctic Plum and Kieffer Pear. They don't like to hear from the Rural. One agent offered peach trees grafted on water elm roots. He made no sales for lack of fools. Another agent sold trees which he said were grafted on a kind of stock that sent up such a smell that the borers never touched it. He found some customers, strange to say.

Monroe Co., Iowa. J. N. B.

Before the war, people here were planters but not farmers. We raised great crops of cotton, rice and sugar but let the smaller things go. Since then, while we have been wanting to change, we have been unable to learn to do as our father didn't do. We must get rid of the olds-tyle system of cultivation and learn the thrift, economy and management that have made other countries successful. How are we going to learn?

Sumpter Co., S. C. E. J. K.

We have to pay 7½ cents a foot for tile here, and sell cabbage at two cents per head and common grapes at two cents per pound. My four Jerseys keep us from running out of dry goods and groceries. They are doing extra well and support the family in better shape than many men could do. Times are hard but we expect to live yet. We have enough to eat and drink and wear. That is a good foundation anyway. I have successfully reduced 200 large carcasses by the use of fresh manure and gypsum. I have now enough fertilizer to do my 20 acres for a long time. J. K. P.

Knoxville, Tenn.

A neighbor has a hooking cow. She practices her peculiar habit upon every person or thing within reach. Among her farm companions is a monkey. The first time the cow saw him, she, as usual, lowered her head and "made for him." The monkey waited until she was within reach and then jumped quickly to the top of her head between the horns, and run the whole length of her body and jumped off at the rear. The cow was so badly frightened that she ran all the way to the stable. Since then she has behaved herself. C. A. U.

Falls church, Va.

A farmer who has everything convenient can take care of 200 hens without neglecting his other work. I do it and my work is generally done in time. Duck raising will not pay unless one is near a hotel or other good market where ducks can be sold at a fancy price. C. S. P.

Plymouth Co., Mass.

We have apples enough out here. In our apple season hundreds of bushels rot on the ground because there is no market near enough to get even with freight, etc. California apples to be appreciated must be tasted in their season and before the taster has filled himself with apricots, grapes, pears, strawberries and the like. Our apples will not keep well, but I find that they compare well with "Chicago" apples that have found their way out here. I have lived in the great apple-growing regions of this country—Michigan and Western New York—yet I must stand by our California apples; our Yellow Bellflower can't be beat. You can take an early start from the northeast corner of Maine and look all the way along to this place, so as to arrive here in October, and fail to find such apples on the road. The best of it is, we have them every year and no frost to cut them off. It is here just as it is elsewhere; poor fruit will find its way to market, and just because it is cheap, it will be hawked about the streets and carry a bad name into every kitchen. California is well able to supply her own apples.

Santa Barbara Co., Cal. O. N. C.

CATALOGUES, ETC., RECEIVED.

St. Johnsville Agricultural Works. Circular from M. Williams, St. Johnsville, N. Y., proprietor of the above named manufacturing enterprise. The horse powers, thrashers, truck wagons and other implements manufactured at these works have received the highest testimonials. The range in manufacturing is great: from the circular saw, weighing 325 pounds, to the great four-horse power, weighing 4,000 pounds. All machines are allowed to run four days within two weeks after they are received. If a machine does not give satisfaction after ample time has been given for fixing it, the purchaser may return the same at the expense of the maker, and whatever note or cash has been paid, will be returned. The catalogue contains a surprisingly large number of testimonials. We invite all who are interested in work requiring the use of such machinery to send for this catalogue.

Society for the Promotion of Agricultural Science.—Proceedings of the sixth meeting of the above society, from its Secretary, B. D. Halstead, Ames, Iowa. This society, though young, contains some of the brightest minds in American agriculture. It was organized in 1880, and has met yearly since then. It was organized for the purpose of bringing together persons interested in scientific agriculture that discussions as to the methods and results of investigations might be had. The present volume contains the papers read at the last meeting. It is packed full of facts. Papers were contributed by Dr. Beal, Maj. Alvord, Prof. Caldwell, Dr. Sturtevant, and others. This society is doing much for American agriculture as it presents a medium through which advanced thinkers can reach each other.

Cornell University Register—from the Treasurer of the University, Ithica, N. Y. All are familiar with the history of Cornell University. In many respects in is the leading industrial school of the age. It is gratifying to learn that efforts are being made to increase the scope and efficiency of the agricultural department. This would appear to be necessary, as out of a total of 604 students we can find but 22 who are taking the present agricultural course. The register is neat and comprehensive. It should be carefully examined by all who have children to educate. The advertisement of the University will be found elsewhere in this issue.

New Iron Fence for Farmers—circular from the Barnes Patent Iron Fence Company, Easton, Pa. A well considered effort to answer the question—"Which is the best fence for the least money?" The Barnes fence is cheap, strong and durable. The rails are made of wrought iron, seven-eights of an inch wide, one-eighth of an inch thick, and eight or ten feet long. Cattle cannot injure themselves against it and snow cannot drift about it. It can be easily moved, as there are no post-holes to dig and no rails to drive. The price ranges from $1.20 to $1.70 per rod, according to the number of rails required. A new thing. Investigate it by all means.

Roofing and Lining Papers for Poultry Houses. Circular from C. S. Garrett & Son, 12 and 14 Decatur Street, Philadelphia, Pa. Few things have done so much to make the poultry business what it should be as the fact that the means of building cheap, simple, yet warm houses have been greatly increased. Few lining papers have given better satisfaction than those sold by this reliable house. We are confident that our readers will receive prompt and courteous treatment in all business relations they may have with Garrett & Son.

Whitman's Fountain Pump.—Poster from Josiah A. Whitman, Providence, R. I. This excellent pump is deserving of a neater and more attractive advertisement than is given in this crowded poster. A neat pamphlet would have been far more attractive. This implement is considered by such men as Prof. Cook, Sec. Garfield, Prof. Comstock and others as being the best of its kind for spraying trees, plants and bushes as well as for all other purposes to which a fountain pump can be applied. It has given excellent results with us.

What Others Say.

New Fruit Nomenclature.—J. J. Thomas, the worthy horticultural editor of the Cultivator (Albany), refers to the action of the American Pomological Society in correcting and improving the names of fruits. He states that there are more than 250 names of pears with the word "Beurré" prefixed to them. With the exception of a few hard culinary or winter pears, the term applies nearly as well to all the thousand varieties, and is useless. There are nearly as many unnecessary prefixes to other fruits. It is hardly reasonable to require every one of the ten thousand fruit-raisers in the country to write these sterile words every time they refer to these pears. Many other names are inappropriate or misleading, or have been applied by dissemmators to help the sale of second-rate sorts, and others are coarse and vulgar; and it is entirely within the province of the American Pomological Society, on behalf of the great multitude who are to use these names, to correct or improve them.

A Potato Centennial.—Just now Montidier, France, is preparing to celebrate the centennial of the introduction of the potato as an article of human food into France by M. Parmentier, who was born in that town in 1737 and died in Paris in 1815. A chemist and enthusiast, he had struggled for years against bitter opposition, to make the "apple of the earth" (the French name for potato) an article of food; for it was then regarded by the French with the utmost contempt, as fit only for hog feed. Finally he obtained from Louis XVI. permission to cultivate the tuber on the plains of Sublons, near Paris, and in 1786 prepared a banquet to which he invited all the *savants* (the scientists of those days) of France, to prove to them the excellence of the potato and the variety of ways in which it could be made palatable. It was served up in 33 different styles, and was at once declared to be the most delicious of esculents. Parmentier became famous; he visited the King at Versailles, holding a bunch of potato flowers in his hand; Louis shook hands with him; Marie Antoinette allowed him to kiss her on both cheeks, and at a ball at night his Majesty wore a bunch of potato flowers in his royal buttonhole. Since then the potato has had a triumphant career in France, and the 33 styles in which it was introduced by Parmentier have, Alexandre Dumas tells us, been increased to 250. What statesman, poet, financier, orator or soldier has done as much for the real happiness and prosperity of the French people as was done by Parmentier? Have all the "glories" of Napoleon conferred as much "solid" happiness on them? Justly therefore are all the distinguished men of France invited to the celebration, and from the original home of the potato the Rural New-Yorker sends, from the Western Continent, its contribution of praise to honor the introducer of the tuber into France.

The Suffolk Horse is considered in many parts of England as superior to either the

Clydesdale or the Percheron for general farm work. The Suffolk is slightly smaller than either of the above mentioned breeds, nimble and quick, a fast walker and a good keeper. Youatt says the excellence, and a rare one, of the old Suffolk horse consisted in nimbleness of action and the honesty and continuance with which he would exert himself at a dead pull. It is a beautiful sight to see a team of fine Suffolks, at a signal from the driver without a whip, down on their knees in a moment and dragging everything behind them. In color the Suffolk is generally a chestnut, frequently with flaxen mane and tail. We have still room for this excellent breed in America.

BEN DAVIS APPLE.—Dr. Hoskins states, in the Vermont Watchman, that last Winter wiped out all his Ben Davis trees—some 40—though many of them were of considerable size and had produced large quantities of apples. But the trees have never been entirely healthy, and he is glad to replace them with the ever reliable Russians, or with the Wealthy. He feels sure that Ben Davis can be grown in Maine and be perfectly safe 75 miles north of the Baldwin limits. But he would not plant it where the Baldwin succeeds, unless it were to sell after the Baldwin is out of the market, and he is not sure that it keeps much better than Baldwin when grown side by side. In the Northwest it is the great standard market apple, as the Baldwin is in the East. Its true headquarters are in Kentucky, Southern Illinois, Missouri and Southern Iowa. The flat prairie does not suit it, but the further north it can be grown the better it keeps, and the poorer its quality. It can never become a rival to the Wealthy, which belongs in the next one hundred miles north.

DECLINE IN VALUE OF CATTLE IN ENGLAND.—Prof. J. P. Sheldon says that the serious decline in the value of cattle in England has had comparatively little effect in reference to the number of calves that will be raised this year. Calves have been so low in price that many farmers have decided to hold them in the hope that prices will improve by next year. Again, the value of milk is always a powerful factor in the rearing and fattening of calves. Milk and its products are now lower in England than for many years, and with the great quantities of imported beef, English farmers feel that it will pay as well to feed the milk to calves as to run it through the churn or vat, so that the usual number of heifer calves will be raised, and in some sections more than usual will be held. A loss will undoubtedly be felt in the sale of the "calf meals" or milk substitutes which have formed so important an element in English calf raising.

SHORT AND FRESH.

THE London Live Stock Journal notes the fact that in the days of the Roman Empire, a mixed crop of leguminous and cereal plants, like peas and corn, was grown for soiling cattle. This mixed food must have been to cattle what "succotash" is to human beings. This system might be employed at the present time. The practices of the old Romans are, many of them, too good to be lost. Old Roman agriculture maintained in Italy a well-fed population, larger than has ever been there since.....

THE North British Agriculturist thinks that the work done by American chilled plows is yearly gaining favor with British farmers....

IT also says that rough plowing and fine harrowing are the best preparations for a good grain crop.....

A NUMBER of Black Javas have been carried to England. The breed attracts some little attention there. The Plymouth Rock has never been very popular on the other side of the water.....

CONCRETE is found to be an excellent fireproof material. It resists the action of fire and still retains its form. Stone, as is well known, cracks, while iron twists and bends under the action of a severe heat. The Scientific American says it is now possible to construct buildings entirely of concrete.....

A FRENCHMAN has invented a machine for feeding lambs that works on much the same principle as many of the calf-feeders in use in this country. The milk is poured into a long trough from which a number of rubber tubes protrude. The lambs suck the milk from these tubes.....

JUDGE says that women should substitute ribbons for birds as hat ornaments, and thus encourage an American industry. Yes, and discourage un-American foolishness and cruelty at the same time.....

REV. J. G. WOODS, of England, calls a horse a machine. The man who understands his machine can make it last twice as long as one who simply "sets it agoin'." Proper treatment will lengthen the years of usefulness of a horse. It pays better to have a horse retain its youth and spirits a few years longer than to pay for two horses and wear them both out.

ENGLISH Hereford breeders find themselves with many young bulls left on their hands. The $100 registration fee levied upon imported Herefords by the Herd Book managers, keeps all but the very best at home. Many young bulls are sent into districts where Short-horns predominate, and rented to farmers who secure their service for their keep. It is hoped that the calves from these bulls will compare so favorably with those from Short-horns, that a new market for Herefords will be opened. Thus far, however, the venture is not particularly promising.....

AT a meeting of the Orange Co. Fair Association, it was voted that hereafter the exhibitor of animals or articles must be the raiser or producer or the owner, for a period of at least 30 days prior to the exhibition. This was done to prevent the all too frequent custom of buying, and getting together a fine herd of cattle, or buying large vegetables in order to win prizes away from legitimate breeders or farmers. This is a good move. The fairs are for the good of farmers and not for speculators. There are hundreds of Fair Associations in the country which might well follow this example .....

THE prospect for an abundant pasturage is good. Be careful about turning the cows out too soon. Let the grass get a good start before it is eaten down.....

ENGLISH authorities assert that sulphur mixed with grease will enable cattle to resist the attacks of the gad-fly, and thus be free from warble maggots or "grubs." The dressing is well rubbed along the backs of the cattle several times during Summer.....

AN English farmer was recently tried for injury done to land by excessive cropping. The land was rented for a term of years. Several crops of wheat were taken from it, and but little fertilizer was applied. The farmer was found guilty. Can you not rob land of its fertility as you can rob an animal of its energy?.....

IN an American cheese recently cut open in England was found a bottle containing a letter requesting the names of several young ladies who would correspond with the writer. This is the first time a cheese has ever been used as a matrimonial medium. The American dairyman who would send abroad for a wife ought to be ashamed of himself.....

THE London Live Stock Journal says that calves will thrive better upon sweet milk with water added than upon skim-milk. A calf, it says, will thrive and grow upon three quarts of milk per day until it is a week old, when the quantity should be increased to four quarts. This quantity should never be exceeded, but a little water should be added. Many farmers would hesitate to invest four quarts of sweet milk per day in a calf, yet they raise some splendid stock in England, and claim that the first secret of success lies in giving the calf every chance in the first year of its life.....

THE London Farm and Home would mark tools by covering the metal with a thin coating of tallow or wax, writing the desired name with a sharp instrument and then filling the marks with nitric acid. In less than ten minutes the work will be done and the tallow may be rubbed off.....

A WRITER in the Cincinnati Times sets down agriculture itself as a fraud. He says the fact is, agriculture would demoralize a saint. He was almost a saint when he went into it. He is a demon now. He is in war with everything. He fights himself out of bed at four o'clock, when his better nature tells him to lie till seven. He fights himself into the garden to work like a brute when reason and instinct tell him to stay in the house and enjoy himself like a man. He fights the pigs, the chickens, the moles, the birds, the bugs, the worms—everything in which is the breath of life. He fights the docks, the burdocks, the mulleins, the thistles, the grapes, the weeds, the roots—the whole vegetable kingdom. He fights the heat, the frost, the rain, the hail—in short he fights the universe, and gets whipped in every battle.....

THAT the great metropolis has been misgoverned, deceived, robbed by its Aldermen, no longer admits of doubt, says the New York Herald. But what else can be expected from such ignorant and besotted creatures as are elected to office—elected by rum bribery, "deals" and lies? In this New York and Chicago may embrace and shed tears of sympathy.

REV. DE WITT TALMAGE says that one of the trials of the newspaper profession comes from inadequate compensation. There is great rejoicing ever and anon in this land because the price of newspapers has gone down from five cents to four, from four to three, from three to two, from two to one. There are men who would like to have the price go down to half a cent. He never rejoices at such a time, because it means hardship, penury, domestic privation, starvation. "You may not see where it strikes, but it strikes. No newspaper in the land can afford to be published at less than five cents a sheet."....

THE spirit of the above is true enough. But it strikes us that we could afford to sell the RURAL as low as two cents a copy if we made it up of clippings, old engravings, gave up our Experiment Grounds, and printed it upon poor paper.....

THE country is filled with lawyers, says the Orange Co. Farmer, and four out of five are an unmitigated calamity to the neighborhood they infest. They incite litigation and they prey on the weaknesses of their fellows. The same is true to a lesser extent of medical men, adds the N. Y. Tribune.....

WRITE us your experience, farmers; send your opinions to some other excellent journal.....

THE tenderest radishes the RURAL has ever raised were grown in flower-pots of sand. The sand was kept moist with water to which small quantities of nitrogen, potash and phosphoric acid were added.....

A WRITER in the National Live Stock Journal believes that 90 per cent. of the so-called incendiary fires are caused by smoking or the careless habit of carrying matches in the pocket. It is usual for smokers to carry a quantity of matches in the vest pocket. It is comparatively easy for a match to escape from this pocket and fall unnoticed upon the floor. Stock may tramp upon and explode them; rats may bite them into flames. There are a dozen ways in which they may cause mischief. Matches should never be carried loosely in the pocket under any circumstances. A pocket match safe can be secured for a few cents that will prevent all possibility of danger. It is needless and useless to speak of the danger incurred in smoking in and around barns. It is plainly evident that the buildings are filled with the most inflammable material which needs but a spark to start it into flame. As a rule, smokers will not be taught as they should be until they smoke a building through the bowl of their pipe. .....

MAJOR BROOKS says, in the N. Y. Tribune, that we hear of hog cholera—that outrage on Nature. Exclusive corn diet occasions or aggravates it. Filthy water, made worse by the filth of the hogs themselves, full of bacteria and malarial poisons that come from vegetable and animal decay, is all the drink which some hogs get at the season of the year when their thirst is greatest.....

AGAIN he remarks that the civilized world should enter indignant protest against the abuse of dumb brutes. The law should punish transgressors much oftener than it does. The hight of absurdity is reached when people consent to be taxed to "stamp out" what carelessness and cupidity brought in; the hight of audacity is reached when the mischief-makers propose such a tax. Every farm needs cattle; the cattle business should be distributed, the big herds broken up, civilized treatment adopted, and there will be little stamping out to do.....

HARRIS LEWIS says that under the auspices of the present Secretary of the New York State Ag. Society it has "dwindled" down to an annual cattle show—no reports, no institutes"; and the whole concern is "run as a close corporation," and the "fellows" "make money out of it." They get a large "appropriation" of public funds, and their 1885 report pleads guilty to "disbursements" aggregating $7,040, all but $2,861 of which went for "salaries and traveling expenses."....

THE acknowledged receipts, it appears, include: From fair tickets last Fall, $24,412; "refreshment privileges" (chiefly "beer"), $2,393; catalogues, $183; transportation, etc., $141; membership fees, $699; cash from State, $8,000; from citizens of Albany, $3,880—a total of $39,708.....

COMMENTING upon the above, the Ag. Ed. of the N. Y. Tribune says that in view of the fact that the cost of the fair according to their own figures, was $26,091—$13,617 less than the income from it—and that $6,719 is acknowledged as "on hand," we suggest—mindful of present and prospective low prices for farm products—that the Legislature let this little ring of parasites on others' industry worry along the present year with their surplus, the cattle-show profits, and the evil fruits of the "beer privilege," without the imposition of the usual draft upon the reduced income of every reluctant taxpayer in the Empire State.....

BUTTER, says Henry Stewart, is known to be exceedingly absorbent of all kinds of odors. The careless farmers who suffer the butter to become odoriferous of rancid tubs and tobacco smoke; not to mention other sources of foul smells, lose by this neglect. And why should not careful dairymen gain by exposing their butter to the delicate odors of flowers and other sweet scents of Nature. This is done by some of the French dairymen who supply Paris with their choice and expensive products, and who pack bunches of sweet violets, jasmine and roses in the baskets among the rolls of butter, and thus not only make their wares agreeable to the sight, but also pleasant and fragrant to the taste, for the palate is able to distinguish the delicate flavors which these odors possess.....

A MAN may walk a mile in 25 minutes and return refreshed and benefited for the exercise. Let him run a mile and it may harm him in many ways. It is the same with a horse. It is fast driving that kills.....

IT is admitted, says the Weekly Press, that important changes in the diet of cattle should be made gradually; experience proves that the fresh bite of new grass does not destroy the cow's appetite for hay, and it proves too, that cattle fed night and morning and turned out a few hours at a time keep in better condition than if they were suddenly put upon an exclusive diet of young herbage, which has small nutritive value compared with what it will acquire after a few weeks' growth, and which is also loosening and debilitating. The critical change "from hay to grass" is made without any loss when it comes gradually, the cows having their hay and grain twice a day—in diminishing quantity for a time—then at morning only for a week longer, until the feed is dispensed with altogether.....

EDITOR STILES of the above journal, who conducts one of the best agricultural departments we know of, says truly enough that the maker of bad butter is the best friend of the oleomargarine manufacturer. The worse the real butter the better is the chance for the imitation of the best butter. Let it be borne in mind that the maker of bad butter is the *best friend of oleo*.....

MRS. L. HARRISON, according to the N. Y. Tribune, is a competent and trustworthy witness against silk culture. She says that from a dollar-and-cent point of view it is "an utter failure." Also she notes "much dissatisfaction" felt by those forwarding cocoons to the Women's Association of Philadelphia, "as after waiting weary months the returns in many instances are below the cost of expressage." Moreover, those who make money out of this "America's New Industry" are those selling eggs and mulberry trees and books. Notwithstanding the mass of evidence to the same purpose as the above, a few editors continue to publish misleading letters from persons who profit by thus deluding the credulous public.....

THE N. E. Homestead observes that the New York State Agricultural Society holds an annual fair, "but that is all." And the N. Y. Tribune adds: "Yes, and it does this only by a direct tax upon the people and the indirect one involved in the degrading results of its $1,475 beer privileges."..... ....

Everywhere.

RURAL SPECIAL REPORTS.

SETTLERS FOR UTAH.

The Territory; assayists; difficulties of freighting; scarcity of swine; farming; lawyers; surveyors; architects; florists; school-teachers.

OGDEN CITY, Weber Co.—No Territory is less known to the East than Utah, yet few would so well repay acquaintance. It is almost twice the size of Ohio, and has a population of 150,000. It should claim more attention from emigrants if only because it appeared attractive to so shrewd a business man as Brigham Young. A few years ago, before the railroad was built across the plains and through Utah, men who listened to advice to settle here without embracing Mormonism were brave to foolhardiness. The Mormons, wishing to be the exclusive inhabitants of the Territory, harassed the non-Mormons, or Gentiles, for attempting to settle. The spirit of Mormonism is not yet entirely purged of this disposition, still it is held in check, and Gentiles now live here not only with safety but profit; but one must not care for being called "carpet-bagger," or for meeting a cold reception at the hands of the Mormons.

I put aside the mining and stock interests of the Territory, leaving them for capitalists. To invest a small amount directly in either of these huge enterprises is as hazardous as investing in a lottery; but to bring a practical knowledge of assaying into a mining neighborhood, and to settle down with it, and advertise it, and keep enough of one's little hoard by one to buy chemicals with, and to cultivate the acquaintance of the miners who come into the towns in the Winter—this is the way for a poor young man of education to dig silver out of a mine. Another way to divert

silver from a mine without digging it, and without the responsibility of being a shareholder, is to ship eggs, poultry, meat, berries and butter to the mining districts. The fact that spring chickens have bronght $2 each at the mines, and eggs a dime apiece, might mislead one with the idea that produce is more profitable than it really is, much of the apparent profit being consumed in transportation; still enough remains to give the producer and shipper very encouraging returns. It goes without saying that farms and mines do not thrive in close proximity. Miners must go hundreds of miles to market, or, more properly, market must go hundreds of miles to miners. Some of the difficulties attendant upon getting goods into new mining localities are almost incredible. I cannot give a better instance than by quoting from a letter written to my father by a man who was out prospecting for him on terms known here as a "grub-stake":—"When the pack-mules came to the head of Thunder Gulch, four miles east of the Big Bonanza mine, it was mighty steep, I tell you. It looked bad for gettin' on. The snow had got there ahead of us, and the animals wouldn't budge, but stood shakin' on the top of the slope. Rawhides wouldn't budge 'em, so we just took hold an' upset 'em an' rolled 'em down. There was scratchin'! But we had strapped their packs on extra tight, and everything was all right when we got to the bottom." This could scarcely have been said if there were eggs in the packs. They were more likely to contain tinned meats, salt pork, flour and beans, and the sweet, mild California onions, so dear to the miner's palate under the nickname of "miners' apples."

Pork and lard are dear in Utah and reach it from Chicago. Lard is not rendered here, but comes in little buckets, and is sold at exorbitant prices. The reason swine is not raised largely is because the nights are too cold for corn to thrive. But an experiment is being made on a ranch near Ogden, the result of which is being carefully noted. If it succeeds it is hoped a domestic instead of an outside market will supply local needs in the future. The experiment is the gathering and parboiling of the prickly pear cactus, which grows wild among the sage brush, and the feeding of it to the swine. It is glutinous and fleshy, and, when the prickles are removed by parboiling, is said to be ravenously devoured by the pigs. The Mormons say that when they suffered famine in the early days here, they considered the cactus fine food, parboiled and fried.

Farming in Utah is profitable, and would be vastly so with more machinery. Farming lands can be had from the Government under the Pre-emption, Homestead, Desert-entry and Timber-culture Acts. The Pre-emption costs most, the Timber-culture next, and the Desert-entry is cheapest. If an irrigating ditch can be run through the farm, a competency is secure. There is often trouble between the Mormon and Gentile neighbors about the water supply. Each will shut off the supply from the other on slight provocation, and so injure his crop. Farmers claim that farming is so profitable here because of irrigation. There is no fear of drought, no speculation about the weather. Irrigation compared to rainfall is constancy to fickleness. A water-right once secured, irrigation can always be relied on.

In Utah, there are many willing hands to work, but heads to plan are scarcer. The Territory could give practice to more lawyers than are now at her bar. Disputed water-rights, cattle ranges, mining locations and land cases supply ample practice. These same interests give employment to surveyors, who might come in large numbers. Architects from the East, after learning the values here, would greatly improve the style of architecture, which now, outside of Salt Lake City, is crude. While planning and building for others, the honest architect may be building brick by brick his own fortune. Non-Mormon under-mechanics and workmen would not be wise in coming yet to Utah, as there are many excellent artisans here among the Mormons. To give a beautiful setting to the work of the architect, there are fine English and Dutch gardeners here, but they seem to be confined to Salt Lake City, and a few nurserymen and florists could do well in the outlying towns.

No complete flora of Utah has been prepared, and botanists will find a rich, fresh field here. Ornithological taxidermists will find over 400 varieties of birds, from the pouched pelican to the humming-bird.

The schools of the Mormons are schools in which "knowledge comes but wisdom lingers." In them is taught the shocking creed that Christ practiced polygamy, and also there is taught a belief in a plurality of gods; and that plural marriage is commanded by Divine revelation. The Gentiles cannot send to them, so that each church supports a school. Secular schools would do well here, and there is felt a want of the kinder-garten system. In the early days of Mormonism the only healing art practiced was the laying on of ordained hands for the cure of disease, but of late years physicians have made headway against superstition, and more could find patients, especially those who would give special study to rheumatism, the only chronic disease prevalent here.

The press is a profession to which Utah opens a wide field. The Salt Lake Tribune is the most thriving paper in the Territory. A Gentile paper must now, of course, express the sentiments of the unpopular minority, but Utah's political future must make her press a profitable and an important one, and there is room for several brave newspapers. Wisely edited, their power for good will be incalculable. In closing, let me recount, in the order in which they are most needed here, the kind of men and women who would do well to consider Utah before choosing another locality in the West: physician, editor, school-teacher, kinder-gartner, architect, nurseryman, florist, assayer, lawyer, surveyor, apiarist. Students of ornithology, taxidermy and geology would find a rich field here. K. D. FORGERON.

Iowa.

IOWA CITY, Johnson County, May 3.—This year bids fair to be the best of the last six. The prospects for fruit were never better, and the garden and field crops are fully a month in advance of this time last year, and work is well ahead. G. R. I.

Maryland.

WESTOVER, Somerset Co., May 3.—Strawberries and peas are far advanced; muskmelons are up and tomatoes are planted in the open ground. Wheat and and oats are looking well; much of the corn crop has been planted and some is coming up. More strawberry plants have been put out this Spring than for several years. On account of the low prices of corn, many of our farmers are planting more strawberries and less of that grain. The present prices are: corn, 35 and 40 cents; wheat, 90 cents; oats, 35 cents; butter, 25 and 35 cents; eggs, 10 cents dozen. S. C. S.

Michigan.

REDFORD, Wayne Co., May 1.—Wheat looks promising. Clover looks well; only few pieces winter-killed. Apple trees are very full of bloom. Small fruits look good for a full crop. Oats mostly sown. Weather very fine. R. A. L.

Minnesota.

BEAVER CREEK, Rock Co., May 3.—We have had very fine weather for spring work. Small grains all in. Some have planted corn; many more will plant the first of the week. Some have sown a part of their flax (which this year occupies nearly half the cultivated ground); more are waiting for the weeds to start so that a part of them may be killed before the flax is sown. L. D. M.

Tennessee.

WILFORD, Wilson Co., April 28.—A good many farmers in this county and Rutherford planted corn just before the rain storm of March 28, which was the hardest ever known here for the length of time. Many of them have to plant again. There have been larger areas of oats and clover sown than usual. Wheat is looking very fine. A large crop was sowed last Fall. Corn is from $1.75 to $2 per bushel; flour, $3 per cwt.; cattle are very low: good milch cows and fat cattle are the only kinds in demand, and milch cows from $20 to $30 where the calves are young. More interest is being taken in fruits, in apples and grapes especially. W. B. A.

Vermont.

N. FERRISBURG, Addison Co.—Trees and plants wintered better last Winter than the Winter before, and we had less snow and a lower mercury. We had plenty of rain last season, and perhaps trees and plants made a more healthy growth. Good prospect for the European plums. Some of us had a good crop last year, while others did not. It is quite unusual to have two good crops in succession. L. M. M.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

REMEDY FOR THE CABBAGE MAGGOT.

M. M. L., Cortland, N. Y.—The cabbage maggot is held in check by a dressing of oyster-shell lime applied at the rate of 150 bushels to the acre. The lime is sown on the land after plowing and then harrowed in. The plan described by "Horticola" in a late RURAL is effective, particularly when small plots of plants are to be cultivated. A small quantity of any concentrated cabbage fertilizer scattered in the hill and well mixed with the soil is highly recommended. Peter Henderson saved plants that had been attacked by the maggots by scraping away the earth from the roots and dusting lime thickly about them and again drawing up the soil. A handful of guano was dusted around every five or six plants, or about as thickly on the surface as sand is usually strewn on the floor. The lime arrested the work of the maggots on the stem and the guano started a quick growth, which caused the plant to make new, strong roots. 2. The kerosene milk mixture can be made by placing one part of kerosene and two parts of sweet milk in a jug or other vessel and rapidly shaking until the union is complete. Then put in twice as much water and shake again. This mixture must be kept well shaken or stirred while in use. If allowed to settle, the free kerosene rises to the top, and this will be death to the plant. The soap mixture is better. To make it, put one quart of soft soap with one gallon of water into a kettle and heat to the boiling point. While still boiling hot stir in one pint of kerosene oil. Hard soap or whale-oil soap will answer. 3. Radishes can be kept free from insects by a light dressing of common salt applied in the Fall, or by a dressing of lime just before sowing the seed.

MUSHROOM CULTURE.

W. R. S., Ravenna, Mich.—"To start and keep up a mushroom bed," take fresh horse manure, free from rough straw, and pile it up loosely to "heat." When it heats and before it "burns" any, turn it over, and repeat this turning just as often as it heats again and before it begins to burn, till it begins to "mellow," say in 14 to 24 days' time. You may then make the bed in a dry shed, a cellar, a pit, under a greenhouse bench, or anywhere else that is convenient, where a steady temperature of 50° to 60° may be maintained, the atmosphere is steadily moist and there are no undue exciting or drying influences. Darkness is beneficial, but not at all absolutely needed. Make the bed nine to ten inches deep and very solidly packed. After a few days the heat may rise to 130°, but wait till it declines to 100° before you spawn it. Get fresh brick spawn (costs about 10 cents a pound) and break it into lumps about the size of a hen's egg, and insert these three inches deep into the bed and some six to nine inches apart. In 10 days' time from spawning, cover the bed with good common field loam about two inches deep, and make all very firm. In four to five weeks signs of mushrooms should appear, and in six to seven weeks from earthing over there should be a good crop. On an average, fresh manure needs three weeks' work or 10 days in the bed before spawning; mushrooms appear six weeks after spawning, and beds continue in good bearing about four weeks. Mushrooms are a most uncertain crop. Maggots in May and hot weather in Summer render their artificial cultivation during Summer impracticable, or at any rate unsatisfactory.

APPLES FOR ENGLAND.

"Subscriber," Putnamville, Ont., Canada.—1. What apple should be planted here for exportation to England? 2. How would the Newtown Pippin do here? 3. From whom can apple trees be obtained?

ANS.—1. As shown by a number of reports in our "Crops and Markets" during the past Winter, the following were the American varieties sold in the English markets: R. I. Greening, Spitzenberg, Baldwin, Newtown Pippin, Golden Russet. The prices varied a great deal in accordance with the extent of the supply thrown on the markets, all arrivals being immediately sold by auction, and as many as 8,000 to 10,000 barrels being offered at once in Liverpool. The prices for the different varieties, however, nearly always bore the same proportion as that indicated in the report of the RURAL for January 7, last; Greenings, $2.21 to $2.70; Spitzenbergs, $2.70 to $3.19; Baldwins, $2.90 to $3.37; Golden Russets, $2.95 to $3.90; Newtown Pippins, $2.95 to $6.03. Some of these, however, will hardly thrive in your sections. 2. The American Pomological Society gives one star to the Greening in Ontario; two to the Baldwin; none to the Newtown; and one to the Golden Russet. The stars are not indicative of the quality of the varieties; but of the extent to which they thrive in any section; and the Spitzenberg, being a Russian, is likely to be hardy with you. The Ribston Pippin and St. Lawrence are the only other apples double-starred in the Province, but the Fameuse, Gravenstien, Hubbardston Nonesuch, Mother, King of Tompkins County and Wagener all do fairly well in some parts of Ontario. 2. Not at all. 3. Ellwanger & Barry, Rochester, N. Y., are a trustworthy firm.

TREATMENT OF A TROUBLESOME MARE.

M. C. G., Fredericksburg, Va.—My young mare is very restless while standing in the stable, moving her hind legs from side to side, switching her tail and kicking, sometimes violently, but generally tramping about and kicking the sides of the stall lightly. She is very hard to crupper, being inclined to kick during the process. How should she be treated?

ANSWERED BY F. L. KILBORNE, B. V. S.

The trouble is evidently nothing more than irritability, nervousness or viciousness, and the treatment required is a thorough course of training. For the kicking in the stable, attach with a strap, 15 to 18 inches of log-chain or a wooden clog to the limb used in kicking. The mare will soon tire of the practice. To harness and apply the crupper, first buckle a strong strap around the fetlock of the near fore foot, lift the foot until the heel comes in contact with the elbow, and buckle the strap tightly around the fore-arm. While thus strapped, the mare cannot put this foot to the floor, and being on three legs cannot kick. Now harness and apply and remove the crupper until the animal will stand quiet during the operation. Repeat daily as long as necessary. A few lessons should be sufficient.

TREATMENT OF A PREGNANT MARE.

W. H. B., South New Berlin, N. Y.— 1. How should a very fat 11-year-old mare that has done no work all Winter, be treated until she foals in June? 2. Ought she to be worked much? 3. Would it be well to keep up grain feeding? 4. What are the cause of, and a remedy for grubs in the backs of cattle?

ANS. 1. The mare should be worked moderately or turned to pasture where she can exercise regularly. 2. Moderate, steady work, or regular exercise is very beneficial, much better for both mare and foal than idleness. When accustomed to hard work, a mare may be simply worked reasonably hard to within a month of foaling, if properly cared for. But for three or four weeks before foaling, light, steady work is preferable. Excitement, straining, hard pulling, over-feeding or allowing too much water when thirsty is to be avoided. 3. No, withhold the grain and feed sparingly, until after foaling. If turned in pasture, let the feed be short. Breeding animals should not be kept very fat. They do much better when simply in fine working condition. 4. Read the article on this subject in the F. C., of April 24.

COLT WITH "BOW-NECK" AND TAIL CARRIED TO ONE SIDE.

G. C. C., Shashequin, Pa.—My one-year-old colt is a very fine youngster except that the top of his neck is rather low down, and he also often carries his tail a little to one side, especially when he feels pretty well; what should be done?

ANSWERED BY F. L. KILBORNE, B. V. S.

If the colt is "bow-necked," you probably cannot now change it any more than you can the shape of the head. Feeding from a moderately high rack will cause him to carry his head higher, if that is what you desire. By cutting across the muscles of the side of the tail towards which he carries it, and keeping the tail tied to the other side until healed, this habit may be corrected. The services of an experienced veterinary surgeon, or one familiar with the operation, will be required to insure success.

DAILY COLIC IN MARE.

D. W. S., Martensburg, W. Va.—My mare with foal has colic every day, sometimes severe enough to cause her to give every evidence of much suffering; what should be done?

ANS.—Knowing nothing of the conditions surrounding the mare, we cannot tell the cause, nor can we give a remedy, except in a general way. Give a laxative diet with grass, roots, or bran mashes, or gradually turn to grass in a shady pasture. Whenever an attack occurs give frequent, copious, warm water injections per rectum, with slow walking exercise or brisk rubbing of belly with whisps of hay or straw. Give two ounces of Glauber salts and one ounce of powdered gentian twice daily. If a severe attack occurs, give one dram of sulphuric ether and two drams of belladona in one-half pint of raw linseed or sweet oil. Purgatives, which are usually given for colic in horses, might be unsafe during pregnancy.

A KNEE-SPRUNG COLT.

G. E. L., East Setauket, N. Y.—After working my five-year-old colt a few days this Spring, I noticed that after a hard drive his knees would tremble, and he is a trifle knee-sprung. I attribute it to feeding too much grain in the fore part of Winter, and letting him stand in the stable. Am I right?

ANS.—You are entirely wrong. The knees are not sprung by feeding, but by overwork and hard driving, especially in young animals. Very little can be done, except to give the horse a long rest where he can have walking exercise. Lowering the heels and using thin-

heeled shoes will aid somewhat. A partial recovery may be expected in young animals.

ITCHY SKIN IN A COW, ETC.

A. S., Beechwood, Pa.—When out, one of my cows scratches herself so much as to rub off the hair; the hair is full of dandruff, and the skin of worms, and she has a little cough; what should be done for her?

ANS.—The cow may rub herself because she is troubled with lice, scabies or mange; or the trouble may be due to the condition of the skin. Examine the skin carefully for lice and also for the acari that cause scabies (see Scabies in the F. C. for Jan. 30). If acari are found, treat as there described. For lice, use the tobacco wash freely or wash with water that is saturated with coal oil or kerosene. In the absence of both parasites, use the wire card daily. Even if the parasites are present, the daily use of the card will break up and remove the dandruff and improve the condition of the skin. For the cough, take one dram of solid extract of belladonna and four drams of saltpeter, mix with sirup to form a paste, and smear upon the back teeth twice daily, and let the cow swallow as slowly dissolved.

FOOD FOR COLT.

O. S., Otisco, N. Y.—What is the best food for a young colt the first Winter after weaning, health and growth considered?

ANS.—Fully as much depends upon the care and protection the colt receives as upon the kind of food. A colt receiving no care may not thrive on any kind of food. Good, clean hay, bright straw, or corn fodder are all good. A variety is better than any one alone. One to three pints of grain twice daily, according to the needs of the animal; where straw is largely fed, a little more grain may be required. A few quarts of roots daily are beneficial; also a handful of oil or linseed meal twice daily with the grain. These aid in keeping the digestive organs in a healthier condition, and will improve the appearance of the colt.

Miscellaneous.

J. D. I., St. Thomas, Fla.—1. Here we pen out cattle at night, turning them out into the woods during the day. In order that the droppings may fall in the cow-pen, when should cotton-seed meal be fed? 2. What papers in New York give daily produce market reports? 3. Is there any agricultural or "truck farmers'" paper printed in Bermuda? 4. What Farmers' Club's constitution would be a good model? 5. Do new potatoes from Bermuda bring better prices than those from Florida in the N. Y. market?

ANS.—1. When cotton-seed meal is fed to cows or other cattle, it is better to give it in small rations, at frequent intervals—at least twice a day. It would not be wise to feed cotton-seed meal in large quantities for the sake of making the manure rich. This meal is exceedingly nutritious, and a small Southern cow should not have more of it than a quart at a feed twice a day. It would be better to use the meal itself as a fertilizer than to overfeed it to any animal. 2. The leading produce dealers issue a daily bulletin for the use of their regular patrons; but the weekly reports given in the RURAL contain everything that is given in the weekly bulletins. The daily business papers, such as the Journal of Commerce, $15 a year; and Commercial Bulletin, $12 a year, give full produce market reports each day. 3. We know of no agricultural paper published in Bermuda. The Gazette is the only newspaper in that island, and is the official journal. It contains all the news of the island, including market reports. 4. That of the Elmira Farmers' Club, Elmira, N. Y. 5. Bermuda potatoes sell higher than any other kinds of early potatoes because they are in the market before any other kind. The seed for planting in the island is all imported from the United States, and is the common red or merino potato grown by a few persons especially for this use. The seed can be procured from any dealer in produce in New York City. See our advertising columns.

H. A. B., Odessa, N. Y.—My seven-months-old boar pig has never shown more than one testicle; can he be fitted for the butcher either now or in the Fall?

ANS.—When butchered the other testicle will be found in the hog, the cord being too short to let it into the scrotum or sack. Such pigs—with one testicle in the body—are not salable by law; but the injury to the meat is more imaginary than otherwise. The pig should be killed before cold weather, and while in as passive a state as possible, and it will be found that any rankness in the taste of the flesh is not perceptible. This is all the injury there can be in the flesh for food.

J. C. V., Ft. Scott, Kans—Can moss that was received dry in bales last Fall, and which was used for packing nursery stock through the Winter and Spring, be kept through the Summer, and be again used for the same purpose? 2. Is there any standard work on varieties, care and propagation of evergreens?

ANS.—Yes; but it is not quite equal to fresh moss. The more it is handled and the finer it becomes, the less valuable it is. We prefer to keep it dry, and wet it up before using. 2. The "Book of Evergreens" by Josiah Hoopes, is the best work we know of on evergreens and their propagation.

G. J. B., Evant, Tex.—How can a young horse be castrated, only one of whose testicles is in sight?

ANS.—Except in the hands of a skilled operator, the operation is very difficult and dangerous, while it would take too much space to describe the operation in full. Unless you can secure the services of one who is familiar with the operation, the colt had better remain uncastrated.

S. H., Pulaski, Pa.—When is the best time to sow Orchard Grass, and how much to the acre, along with clover and Timothy, in an orchard sown in rye last year.

ANS.—For your climate perhaps Fall would be as good as any. A mixture as follows would serve: 1½ bushel of Orchard Grass, ten quarts of Timothy, eight quarts of clover. We don't know why any one should prefer Timothy to sow with Orchard Grass.

F. W. W., Chatham, Ont., Canada.—Hen manure and ashes, bones, etc., as fertilizers cannot be compared since hen and barn-yard manure are *complete* manures, furnishing all needed kinds of plant food. Ashes and bones are not complete. To get the equivalent of hen manure, raw-bone flour and ashes with the addition of more nitrogen than the bones contain, should be used.

Several Subscribers.—The Field Force Pump will give good satisfaction for use in spraying fruit trees with Paris-green. One pound of the poison mixed with 100 gallons of water will kill insects. Apply just after the blossoms fall.

W. D. B., Canterbury, Ct.—From your description we cannot locate the seat of the lameness in your horse and therefore cannot answer your questions. Better consult a veterinarian who can examine the animal.

Several Subscribers.—The saw shown on page 259 of the RURAL for 1885, is called the Wagener saw. It does good work. For sale by Charles Wagener, Pniteney, Stuben Co., N. Y. Price $2.

W. R., Fresno Cal.—Agave Americana (the American Aloe) is peculiarly adapted for a hot, dry climate. Drogue, florist, City of Mexico, Mexico, can furnish the seed.

J. P., Kingston, N. Y.—Our report of the Kieffer four years ago was that it was not hardy north of New York. The stem sent seems to us evidence of this.

F. N. W., Arkansas City, Kans.—We can only suggest that you turn the mare on to the wet pasture for a few weeks or months if necessary.

F. S. (no address).—From your description of the symptoms we can only *guess* what ails the calves.

DISCUSSION.

E. A., OF WAYNE, N. Y., sends us a double Thalictrum anemonoides. She says she has seen the single variety, but never remembers seeing a double one before. We have found specimens with two and three whorls of sepals, but never a double one. There is, however, a double variety.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

DRESS GOODS.

JAMES McCREERY & CO.

are displaying an extensive variety of wool and silk-mixed Dress Materials suitable for mid-summer wear.

Among the latest importations will be found Challies, Mohairs, Summer Sicillienne, Dress Barege with bayadere and graduated stripes; all grades of Canvas for seaside costumes.

Also a large variety of Tweeds, Cheviots, etc., including the new hair-line stripes so much in favor.

Samples sent on application.

ORDERS BY MAIL from any part of the country will receive careful and prompt attention.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MAY 22, 1886.

If any subscriber of the RURAL NEW-YORKER *has not received the paper regularly, he will confer a favor by notifying us. We are anxious to extend the time far enough to make up for all mistakes or neglects.*

IF the number on your address label is 1895, your subscription expires with this number; if 1896, next week; 1897, in two weeks, etc.

THE writer was talking a few days ago with one of his neighbors about the best way to raise muskmelons. The neighbor said that last year he manured them in the hill. They started off finely, made a good growth of vine, but began to fail as the fruit set and developed. "Now," said he, "this has happened before, and my belief now is, as the RURAL has often stated, that though the young vines were well fed, the older vines were starved. The roots had grown beyond the manure, and had nothing to draw upon when the melons began to form; and that is the time they most need food."

ONE of the largest crops of corn ever raised at the Rural Grounds was planted June 8th. We were then inclined to speak well of planting early kinds late. We once harvested a fine crop which was planted late in April. We were then inclined to favor very early planting. But a second early planting was much injured by frost, and it has been found that, in most seasons, drought will hurt late-planted corn in our sandy soil. Well, years of farm experience have taught us that it is never safe to plant before early May, the exact date to be decided by the season outlook. We may plant earlier and take the risk.

WE have three trees growing near each other, which, just at this season, are beautiful indeed. The leaves of the Blood Birch are now of a blackish-purple color; those of the Purple Beech are of a reddish-purple, while those of Schwerdler's Maple are of an amber-purple, if we may so describe colors. Near these three trees is another, the Golden Oak, which is just beginning to unfold its leaves which are at first yellow. A more charming group we can scarcely conceive of. The leaves of the Blood Birch turn, later in the season, to a dull, deep green, and, without making nice distinctions, so do those of the Beech and Maple. The Oak resumes something of its golden color in the Fall. As something akin to the above trees among shrubs, may be mentioned the Purple-leaved Hazel, the Golden Spiræa and Pissard's Plum.

THE bill making the Commissioner of Agriculture a Cabinet officer is again up in Congress. A considerable number of prominent farmers are opposed to it; but at conventions and other public meetings of farmers such a measure invariably receives overwhelming support. There does not appear to be any very urgent demand for it, however, among the farming community. The interest in it is of a mild nature, on the whole. The elevation of the official head of the Agricultural Department, would be quite acceptable to the vast bulk of our agriculturists, but there is slight chance of its taking place at this session of Congress, and the agricultural disappointment will hardly be excessive.

IT is time now to begin to talk about the next fair. The life of the crop is just beginning. You have all the Summer before you in which to fit the stock for the prize. Begin early this year, and see what you can do. It is your duty to do one thing at least, and that is to do all in your power to keep liquor off the fair grounds. Talk against it wherever you may chance to be—at the store, on the road, at home, anywhere you can get an audience. Farmers can keep this cursed thing out of their fairs if they will only think so. Public opinion determines such things. Give your opinion, your voice and your influence on the right side. Begin to talk now, and never stop till the thing is done. If you don't succeed this year, do your hardest talking on the fair grounds.

PETITIONS for the passage of the bill to tax bogus butter are daily being presented by the hundred in both the House and Senate from farmers in every State east of the Rockies. There are also a number of petitions in opposition, many of them of late from the Knights of Labor. The manufacturers of cotton-seed oil are especially earnest in their appeal to Southern Congressmen to vote against the bill, on the ground that its passage would depress the price of their product, which is largely used in the concoction. A remonstrance from the Chicago Live Stock Exchange says that cattle are worth $10 more per head now than they would be if the manufacture of bogus butter were prohibited. Who seeks to prohibit it? We merely want to regulate it, and to force its handlers into honest dealing. Supporters of the bill should lose no time in writing to their Congressmen on the matter. Have you done so? Remember a multitude of small efforts generate a tremendous pressure.

Little drops of water, little grains of sand,
Make the mighty ocean and the pleasant land.

OBSERVATION on Fourteenth Street and upper Broadway, and several of the other fashionable "shopping" streets of this city, leads us to believe that the thoughtlessly cruel fashion of wearing birds, whole or in parts, as decorations for feminine headgear, is waning. Even in the Bowery, Grand Street and other great thoroughfares thronged by "working girls" and women who make little pretence of being fashionable, fewer birds are seen on hat and bonnet, although this class is rather slow to follow change of fashion. The millinery stores, however, still display a varied assortment of head-gear barbarously "ornamented." Some hats are *disgraced* with two or more small birds, others with a single larger one; others with wings, heads or plumes. One firm bought last year over 60,000 birds; another 35,000; 70,000 were shipped to dealers here in four months from a single village in Long Island. It is to be hoped that fickle fashion will rapidly change to a more humane style. Flowers are now the "rage" here. Won't you help by word and deed to change the fashion in your neighborhood?

SAID a farmer the other day, looking out at one of the city parks, "If I had such grass as that is on my pasture, my cows would get too fat to walk." While the grass on this little plot was thick and green, his pasture was covered with a light sickly growth that compelled the cows to travel miles every day in order to pick up a living. The city plot had been underdrained, carefully cultivated and fertilized and well seeded. His own pasture had been left to take care of itself without manure, except that dropped by the cattle roaming over it, and not a pound of seed had been scattered upon it. No one can expect a farmer to spend the time and money in handling his pasture as these city parks are handled, yet the principles on which the success of one mode of cultivation is based are appliable in the other. A stout boy with a heavy wooden mallet could in two days, scatter the hard clumps of manure, so that it would do five times the work it now does. A few pounds of grass seeds, evenly scattered upon the surface, would surely make their mark. There are plenty of pastures in this country, that are far more luxuriant than any of the city parks ever can be. They were all produced by proper fertilization and care. The pasture should never be neglected. Too much of the money on the average farm comes from it. Many a farmer can learn valuable lessons from the keepers of our city parks.

WE want to see more students in the Agricultural Department at Cornell University. The equipment is in excellent condition, and the course of instruction ranks among the best in the country. Dozens of young men go from this to other States for Agricultural instruction. These should be kept at home. The requirements for admission into the Agricultural Department at Cornell have heretofore been quite rigorous, so that the greater number of farmers' boys have been unable to enter. Heretofore, students over 21 years of age have, on the recommendation of members of the faculty, been admitted as special students, and have been permitted to take such courses as they desired. This limitation of age has precluded large numbers who might otherwise have attended. Henceforth, any student 18 years of age, with a fair English education, may avail himself of all the advantages offered by the Agricultural Department of Cornell University free of expense for tuition. We are glad the requirements for admission have been made less rigorous, both as regards previous training and age. We would gladly see 150 agricultural students at Cornell. The State would be benefited in a marked degree by such an attendance. We will gladly give our most earnest support to any measures tending to increase the size of the classes in agriculture.

SPECIAL.

Those who, having applied for the Rural's present seed distribution prior to May 15th, have not yet received it, will kindly notify us by postal at once.

WE need a better test for beef at our Fat Stock Shows. There is a great advance in the present judging of beef cattle compared with the methods employed 50 years ago, yet we might well go still further. In olden times judges were satisfied with an outward examination of the animal. Now the butcher's block is regarded as the final test. The prize steer at our Fat Stock Show has gained fame enough. There is no reason why he should live longer. We are told the percentage of dressed meat, weight of each part, gain per day, and, in some cases, the cost of producing a pound of beef. Can we not go further and take the flavor of the meat and its economy in cooking into account? Encourage the improvement in quality as well as in quantity of beef. Carcasses of prize animals, which we have examined, appear to be coated with several inches of pure fat. Is this meat the most economical that can be produced? The bulk of animals has been wonderfully increased by the system of awarding prizes for the greatest gain in weight without much regard to quality of meat. It seems as if the practical limit in this direction had about been reached. It is a common belief with the public that grossness in animals, vegetables and fruits indicates an inferiority in flesh. It will be far wiser to improve the quality of these vast masses of meat than to seek to still further increase the size. Let the final test pass from the block to the pan. We may eventually know the proportion of edible meat to bone, and even the cost of producing a pound of this edible meat. We believe that keener tests would provide a strong incentive to improvement in quality. It is true that such a test might bring some hitherto neglected breed to the front, but in any event the gain would greatly benefit the general public. Why cannot the managers of our Fat Stock Shows move in the matter and establish a class for beef cattle where the quality and proportion of edible meat are solely to be taken into consideration?

CANADIAN DISCONTENT.

WHEN the Dominion of Canada was formed in 1867, Ontario, Quebec, Nova Scotia and New Brunswick were the only Provinces in the confederation, and before the act of union was submitted to the Imperial Government, the great majority of the people of Nova Scotia refused to sanction the action of their delegates in agreeing to it, and displayed a revolutionary violence in opposition to it, and the Legislature declined to assent to it. In Lower Canada there was considerable opposition and a still stronger one in New Brunswick, while Prince Edward's Island and New Foundland absolutely refused to enter the confederation, though the former was afterwards induced to do so. Since early after the formation of the confederation a good deal of hostility against it has been displayed in New Brunswick and Nova Scotia, especially the latter. The root of the discontent lies in the fact that the Maratime Provinces contribute yearly several hundred thousand dollars more to the Dominion than they get back; protection, too, which has been of service to the manufacturers of Upper Canada, has been injurious to them, as it has raised the price of goods by cutting off competition with this country, while the abrogation of the fisheries clauses of the Washington treaty last year, shut them out from the fish markets here, so that there is widespread business depression and distress among the people. Lately, in spite of the utmost efforts of the Dominion Government, a hostile provincial administration was elected in New Brunswick, and last Saturday the Legislature of Nova Scotia, with only six negative votes, passed a resolution declaring that "the financial and commercial interests of the people of Nova Scotia, New Brunswick and Prince Edward's Island would be advanced by those Provinces withdrawing from the Canadian confederation and uniting under one government." If this were impossible, the Assembly declared it "absolutely necessary" that Nova Scotia should seek separation, and ask permission from the Imperial Government to withdraw from the confederation and return to the status of a province of Great Britain with full control over her own fiscal laws and tariff regulations. The chief argument urged was that then a customs union or reciprocity treaty with the United States would be practicable. With the Maratime Provinces discontented with their present condition; Quebec, in part, disgruntled at the execution of Riel; Manitoba uneasy under inadequate Parliamentary representation and a protective tariff, and British Columbia grumbling at the failure of the Dominion Parliament to sanction her provincial anti-Chinese legislation, the provinces of the Dominion do not form an altogether happy family. Ontario, full of life, energy and spirit, is content, however, and seems resolved that no peaceable secession of any of the other provinces shall be permitted.

BREVITIES.

FREQUENT rains, warm, delightful weather at the R. G.

YES, the tender shoots of raspberries and blackberries that are now a foot high will live if carefully transplanted and watered.

MARY WAGER-FISHER'S transcontinental articles will be resumed next week, and will hereafter appear without interruption till all have been published.

GARDENER, of the Farming World, and Cincinnati four-per-cent loan notoriety, who has also been engaged in several other unsavory enterprises, about a year ago sued the Chicago Tribune for $25,000 damages for having libeled him by denouncing his schemes. The RURAL had done the same, and at the time declared that Gardener would never have the audacity to bring the case to trial. The case was dismissed by the Court the other day, because he had fulfilled our prediction.

BILLS now before Congress and which have nearly all passed the House, will restore to the public domain for homestead purposes over 100,000,000 acres of excellent land, withheld from settlement as railroad grants, some of it since 1857. Not a shovelful of dirt has ever been removed on some of the projected roads, yet the land has been held as bait for speculators often for over a quarter of a century. If this just and expedient legislation fails, the fault will rest with the Senate, and especially with the Senate Committee on Public Lands.

THE Women's Christian Association's bill to prohibit the sale of intoxicants at town, county or State fairs, introduced by Mr. Westfall, passed the New York Assembly on Thursday. Now let it be pushed through the Senate and be signed by the Governor. If the managers of our fairs are willing for the sake of a paltry money gain, to deliberately engage in rum-selling, the law should prevent them, not in this State only, but in every State in the Union. The man who sells to another the privilege of selling rum, is morally a rum-seller himself.

INTENDING emigrants should read what is said elsewhere of Utah as a place of settlement. We would especially call the attention of lawyers, yes, and also of doctors to the excellent openings there awaiting gentlemen of their professions. Like the poor who are always with us, there are too many of them here, and we call attention to the advantages Utah offers them, on the same principle on which some of the papers in many sections of the tramp-plagued South, annually call attention to the vast advantages Florida offers in the way of yielding a free livelihood to the thriftless, lazy and "tired."

THERE'S a growing inclination among all parties to restrict rather than any longer encourage the immigration of all foreigners. Immigration is desirable in a thinly settled country which wants hands to develop its resources; but we have here now 1,000,000 men for whom there is no employment, and as many others who cannot work "full time," and why should more be invited except for the benefit of capitalists anxious to keep down wages by overstocking the labor market? It is proposed to tax immigrants $300 apiece, and the recent Anarchist outbreaks stimulate the movement. There is a good deal of talk; but action is improbable—just yet at any rate.

IN view of the importance of legislation restoring to the public vast areas of the public domain, unjustly withheld from settlement for the benefit of railroad corporations, the people should bear in mind the names of the members of the Senate Committee on Public Lands. Here they are; Preston B. Plumb, Kansas; Henry W. Blair, New Hampshire; Charles H. VanWyck, Nebraska; Joseph N. Dolph, Oregon; Henry M. Teller, Colorado; John T. Morgan, Alabama; Francis M. Cockrell, Missouri; E. C. Walthall, Mississippi; James H. Berry, Arkansas. Whatever obstruction may arise with regard to such needed legislation will be in the Senate, the stronghold of capital and corporate interests. So great is the influence of the support of any measure by the Senate or House Committee in charge of such legislation, that in nearly all cases a unanimous support insures the passage of the measure, and the closer to unanimity, the greater the chance for the bill. Some of the above men are known to be honestly in favor of wresting from the railroads the lands to which they have no just claim; others are known to be personally interested in such corporations, and seldom antagonize the interests of any wealthy corporation for the benefit of the people.

The Herdsman.

GUERNSEY BULL, CLIMAX.

At Fig. 228 is the likeness of Guernsey bull Climax, re-engraved from the London Live Stock Journal. He is the property of the Express Dairy Company Limited, of Finchley, England, and was dropped at Sergentie, in the island of Guernsey, on June 16, 1882. His sire was Preston, a very celebrated bull of the island, whose progeny has probably won more prizes than that of any other bull of the breed, and for whom the highest price up to that time paid for a Guernsey bull was given by a Canadian, who imported him a few years ago into the Dominion. Indeed for three generations Climax's ancestors, on the sire's side, have been winners of first prizes on the island of Guernsey, and he himself won first prize at the Royal Guernsey Agricultural Society's shows in 1883 and 1884, before his importation into England, and, later, at the Bath and West of England Society's Show at Maidstone, he also took first prize, and was purchased for the Company for the highest price ever yet paid for a bull of the breed. In color he is a bright orange-fawn and white, and is remarkable for style and quality. His level back, great depth, vigorous constitution, and perfect head, tail and limbs make him an excellent specimen of the best bulls of the breed.

SHORT HORNS.

Preëminence of beef for profit; value of pedigree; rival beef breeds; Short-horns for milk; the Short-horn the best family cow; beauty of a Short-horn herd; generous feed.

When commencing to form a herd of cattle a few years ago, I looked the whole ground carefully over without prejudice, and with all the breeds before me, I chose Short-horns: and for the following reasons:- First, we wish our cattle to serve as agents for the transformation of feed—grass, hay and grain—into beef and milk at the least cost, and at the greatest profit. I put beef first, as that always finds a waiting market under any condition of season or place, with the least care and labor. Thus, while the milk and butter interest should not by any means be ignored, as a most valuable adjunct in securing money from the food products or the farm, I do think it may well rank second to beef, and yet but little below it.

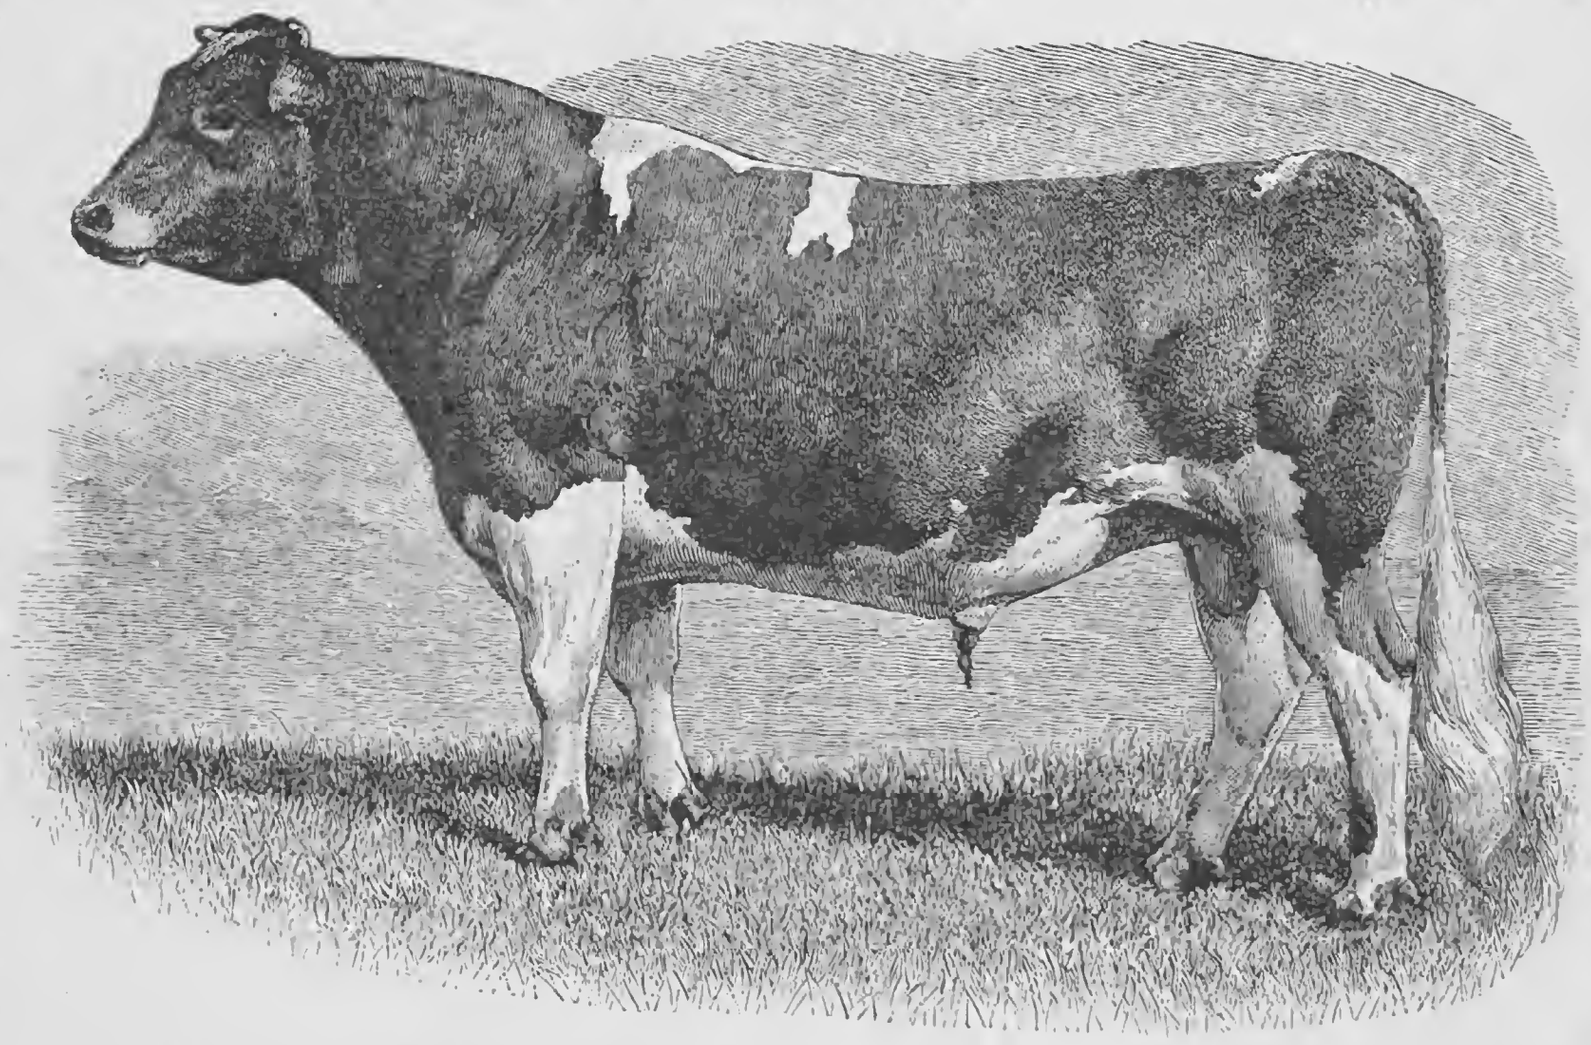
But to secure animals that will make beef at the least expense, we must choose those which have long been bred with this end in view. Pedigree is very valuable in our stock, as it is a guarantee of this careful breeding. Most of our farmers do not appreciate this slowly acquired excellence that long, careful breeding has won for our improved breeds of cattle. It is a sort of sinking-fund, which for years was being laid by with great care and expense and which we to-day are drawing from with such generous results. While the Herefords and Aberdeen-Angus are close competitors in the beef sense with the Short-horns, I do not consider them superior. Just now the Herefords are having a boom—a sort of spurt—but the Short-horns have had a boom all these years. They have stood for years at the front on trial under the severest test of criticism, and they stand as proud and peerless to-day as ever before. When a breed has reached such a state of perfection that one can take almost any specimen steer and make 2,000 pounds of the most choice beef at three years old, surely we need not fear either White-face or No-horns. Surely no breed has been bred up to a standard where, under good, generous care and feeding—and he who does not wish to give these ought not to secure Short-horns—its representatives will show larger returns than our Short-horns.

But, as I said before, there is another string to this bow. We must have some milk, and the more and richer the milk, providing we also get the beef, the greater the profits. Now, here the Short-horn leaves both Hereford and polled breeds away in the rear. Careful tests of the different breeds at the Michigan Agricultural College showed the Short-horns equal to the Ayrshires in quantity, and first of all breeds where both quantity and quality were considered. This fact, coupled with her excellence for beef, makes the Short-horn the best of all as a general-purpose cow, to any farmer who has learned that the best farm economy demands the most generous feeding.

Even the highest and most popular strains of Short-horns rank very high in this respect. When starting my herd, I paid a large sum for a calf from a pure Duke sire and from a Young Mary cow with some gilt-edged top-crosses. People laughed and asked where I was going to build my hot-house to keep her in, and how many scrubs I would need to bring up her calves. That cow is now five years old, and has been our family cow for nearly a year. Though we had for years before some excellent high-grade Short-horns for milk, and for the past three years a very fine specimen of the Judge's Jersey; yet wife and I both think that, when we consider both excellence and quantity, we never had so good a family cow as our present Duchess. I have contended for years that the Jersey is the ideal family cow. I now revise my opinion, and say that, for him who will bestow good care, the Short-horn is the best family cow. A milk yield of 2,000 pounds at two years old, and 10 quarts a day after giving milk eight months, and when due to calve again soon, strikes me as pretty satisfactory.

Second: I keep my farm and cattle partly for pleasure, and I wish that pleasure to be at its full as I look upon my herds of cattle and sheep. What can better fill the eyes than a herd of uniform, large, sleek, magnificent Short-horns. I acknowledge the Herefords to be their equal in this respect, probably a little their superior, as it is difficult to get such beautiful uniformity in any herd of Short-horns. The polled cattle are ugly in appearance; the Hollands lank and ill-proportioned to an eye educated among Short-horns, and the Jerseys even more so. A young Jersey is a thing of real beauty; a herd of old cows in full milk—I have seen the Judge's—are not what just fills my idea of perfect grace as to form.

Third: I think there is nothing more satisfactory to the lover of cattle, etc., than the act of full, generous feeding. I enjoy nothing more than the dealing out of full, ample rations to my stock. With Short-horns this is just what pays; so interest and pleasure walk hand in hand. Short-horns have been bred to this high feeding. It is not only safe but indispensable to the best results. At the recent meeting of the Michigan Short-horn breeders, every prominent breeder present urged the opinion that Short-horns should always be in show condition to give the best results. Thrift and vigor in high condition have been bred in the bone, and are the chief characteristics of the breed. We cannot feed so liberally with most of the other breeds. They have not been used to it, and would become enfeebled, and out of health under such treatment. While purchasing a car-load of Jerseys of a leading Jersey man in Central New York a few years since, he said to me, over and over, "Now don't go to feeding too heavily; that is the great danger in keeping Jerseys." With Short-horns I would say, "Feed heavily; that is the secret of success." And, besides the satisfaction, the more we feed the more capital we employ, and so the more profits we can secure. This was the way I reasoned some years ago as I commenced with Short-horns, and each year has added new emphasis to each point in the argument. SHORT-HORN.



GUERNSEY BULL, CLIMAX, 14 E. G. H. B. Fig. 228. (Re-engraved from the London Live Stock Journal.)

Horseman.

HINTS TO HORSE-OWNERS.

Last week and the week before Professor O. R. Gleason gave daily exhibitions of the management of vicious horses in a large hall in this city, in presence of large audiences of people interested in the noblest of our domestic animals—the horse. The Professor's performances in controlling and subduing the most vicious brutes and in quieting the most nervous and skittish animals, exceeded anything in that line we have seen since witnessing the feats of Rarey over a quarter of a century ago in England. During the performances he dropped a multitude of hints on equine matters, and some of these are briefly jotted down here, as likely to be useful to our readers.

Never buy a horse having long ears with long, straight hairs inside them, narrow behind the ears and between the eyes, with flat, round eyes in sunken orbits, and whose nostrils are small and thick; for he will certainly turn out stupid, hard to teach and incapable of remembering, and like stupid people, very likely be very obstinate. Let your choice have short ears, with short, curly hair inside them; one that is broad between the ears and eyes, with a regular, straight face, and large, thin nostrils; for he will be an intelligent, spirited and willing servant and a faithful friend, if rightly treated.

In training a colt, be at once kind and firm. Make him fear you first, then love you. When you caress him, don't pat his mane, for he doesn't like that. Pat his neck where free from the mane, the point of his shoulder and breast. You can't make too much of a pet of him. Never let him see you are afraid of him. In approaching him, don't say timidly, "Whoa! Whoa!" but go straight up to his head. When you give him an order, do so in a commanding voice, and always order the same thing in exactly the same words, and impress it upon his mind that he must instantly obey. Never say "Whoa!" unless you want him to stop at once: say "Easy!" or "Slow!" or "Steady!" but always use the same word to express the same order. Never lose your temper.

Break your horse of any vices he may have contracted by the mismanagement of others before you got him; and whenever you begin to break a horse, be sure to go through with it, or the attempt will do serious harm instead of good. As a rule, cord bridles, throwing a horse, the double safety rope, and the lifting of his hind feet by means of a rope hitched pulley-fashion to his tail, will quickly subdue a horse, and if repeated several times, will break him of almost all his bad habits, but different horses require different modes of breaking. Never hang a horse on the head or shins with a club or loaded whip.

Finely-bred, intelligent and nervous horses are often easily alarmed, so that they are apt to shy, bolt and run away. We cannot tell what awful suggestions strange things may offer to a horse's mind. A sheet of white paper on the road may, for aught we know, appear to a nervous horse a yawning chasm; the open front of a baby carriage may seem the yawning jaws of a dragon, and a man on a bicycle a flying, wingless monster. But when a shying horse becomes familiar with such things he grows indifferent to them. Therefore when a horse shies at anything, let him smell it, touch it with his sensitive upper lip and look closely at it. Both sides of him must be familiarized with the dreaded object; for if he examines it only with the near eye and nostril he will be likely to scare at it when it appears at his off-side. Rattle the paper, therefore, beat the drum, flutter the umbrella, run the baby carriage, clatter the tin-ware, etc., all around him, and he will soon regard the noise only as a nuisance, and the objects as of no importance. A horse with buck-eyes which render him short-sighted, is more liable than others to this failing. Nothing has so great a tendency to keep up the habit as chastising the horse after he has passed the object of his alarm. If he cannot examine it, the best plan is to get him in some way to pass the object, using as little violence as possible, and always speaking in an encouraging tone.

A horse or cow can be easily prevented from jumping fences thus: Put a strap, with a ring on it, around the near fore leg above the knee, and a surcingle or belt, with a ring, around the body. Then by a short strap, or piece of cord, attach the two rings so as to make a harmless but perfectly effective hobble. To cure halter-pulling in the stall, put a slip-noosed rope around the body, lead the end of it between the animal's fore legs, up through the halter and make it fast to the manger. Then from the loft throw down a lot of clattering tins into the manger. When the horse jumps back the rope will catch him and bring him forward, and he will soon learn not to jump back. To cure a horse of stamping in the stall, hang a moderately heavy bit of wood four or five inches long, by a string seven or eight inches long, from a strap above his knee on each fore leg, so that it will whack lightly against his shin every time he stamps, and he will soon stop stamping. A piece of stout elastic fastened about the hind leg will stop kicking in the stall.

When throwing a horse don't do it in a hurry. The tackle gives you the strength of four or five men, but he doesn't know it. After you have got him on his knees, keep him from rising again, and hold his head firmly toward the near shoulder, and he must soon come down. Let him wrestle and try his strength for a while, and he will be the more impressed with your mastery and the fact that you have overcome him fairly. When you have let him up, pet him, speak kindly to him; make him feel you are his friend as well as his master, and have no intention of harming him. If he refuses to get up after being thrown, blow in his ear, and if he doesn't then jump up, blow a mouthful of water in his ear. The Professor made a good deal of use of "throwing" to subdue vicious horses.

Balking seems inherent in some obstinate brutes, and is the hardest of all equine vices to cure. Very often a balky horse, when in double team, can be started readily by putting a slip-noosed rope around his loins and making it fast to the collar of the true horse. Generally the pressure will start him. Sometimes a very effective treatment is to stand before him and lash his fore legs sharply with a blacksnake whip, not angrily or very severely, but persistently, patiently, for an hour if necessary, though 15 minutes is generally enough, until he concludes there is no comfort in sticking. In extreme cases it is well to put a slip-noosed rope about his neck, hitch a team to it and start them. When he finds his head is going, he will be sure to hasten after it, and often such treatment will give him a horror of balking ever afterwards. If you can't cure or get rid of a balking horse in a team, it would be better to kill him, for his example will be certain to demoralize the true horse, and you'll have a balky team. Sometimes a handful of road dirt thrown in a balky horse's mouth, or a bunch of roughly broken twigs put under his tail, will start him, simply by giving him something else to think of besides the maintenance of his determined obstinacy; but such expedients will have only a temporary effect. Don't kindle a straw fire under him—a Western trick—better shoot the brute or give or trade him away.

Literary.

BOOKS RECEIVED.

THREE HUNDRED PRESENTS. Decorative and Fancy Articles for Presents and Fairs. By Lucretia P. Hale and Margaret E. White. Published by S. W. Tilton & Co., Boston, Mass.

This instructive little book will be highly appreciated by those of our lady readers who wish to add to the beauty of their homes. There are hundreds of little things that cost almost nothing and yet add wonderfully to the beauty and comfort of the home. They are valuable as presents, not because of their intrinsic value, but because of the fact that they represent the labor of some dear friend. We heartily commend this book to such of our lady friends as are interested in decorations. The suggestions regarding the conduct of fairs and other entertainments, will be of great service to those who are called upon to organize such meetings in aid of the church or school.

DOWN THE WEST BRANCH. By Captain Charles A. Farrar. Published by Lee & Shepard, Boston, Mass. Price $1.25.

This is supposed to be a record of the adventures of the Lake and Forest Club, a company of boys who spend their vacation "camping-out" in Maine. As a rule, we think too many of such books are written. They are all about the same thing, and in every one, boys go safely through adventures that not one man in 500 can ever expect to encounter. Still, there will always be a demand for such literature. As children delight in listening to old stories time after time, so older boys enjoy the stories of adventure. As to the influence exerted by such stories, opinion is divided. The Sunday schools of the country are filled with them. The present volume is well written and contains much scenic description that is admirable.

SALAMMBO. By Gustave Flaubert. Published by Saxon & Co., New York.

This is a weird, horrible, utterly useless, historical novel. Flaubert was a master at word painting and some of the scenes in Salammbo are magnificent specimens of powerful description. The story deals with a hitherto neglected period of the history of Carthage. Salammbo was the sister of Hannibal, and daughter of Hamilcar. The story deals with the attempts of a vast army of Barbarians to capture Carthage. Hannibal is seen only as a wild and vicious boy. The Carthagenians were a treacherous, cruel and cowardly nation In order to portray with truth, scenes in which they were actors, it is necessary to fill pages with cowardly murders, fiendish cruelty and base betrayal. For this reason Salammbo is not pleasant reading.

IMPROVEMENT OF THE SENSES. By Horace Grant, Published by Lee & Shepard, Boston. Price 50 cents.

This is an exceedingly valuable little treatise on the best mode of cultivating the senses in children. The idea enforced is that the usual method of forcing a child to learn long lists of words or facts with the majority of which he will have no connection in after life, is wrong. Text books are not necessary in the education of young children. Bright object lessons and interesting talks about familiar objects, will be far more serviceable in amply rounding out the youthful mind. We believe this idea is in the main correct. Our present system of education is faulty in the fact that it cultivates a mechanical memory, and discourages practical thought. The forms of questions for object teaching given in this book are admirable.

COMMON SENSE IN THE CARE OF THE PET CANARY. By Mrs. M. E. C. Farwell. From the Murray Hill Publishing Company, New York City.

This is a bright, well written little book, and, so far as we see, reliable. The author has evidently written from practical experience. A bright, clear-voiced canary can change the character of many a home. All lovers of the little golden bird will find much to instruct them in this book.

For Women.

CONDUCTED BY MISS RAY CLARK.

AN OLD MAN'S MUSINGS.

HOLLY DEAN.

SMOKING my pipe in the twilight,
Dreaming the hours away,
Linking the past and future
Into the present day.

Smoking my pipe in the twilight,
When the winter's day is done;
Dreaming of fairy meadows
Under the summer's sun.

Dreaming of wondrous grottoes,
Deep in the woody hills,
Dreaming of silver brooklets,
Dreaming of tinkling rills.

Smoking my pipe in the twilight,
By the fireside's cheerful glow;
Dreaming of Spring and Summer,
Seasons of long ago.

Dreaming even of Autumn,
Leaves of crimson and gold,
Ripened sheaves for the harvest,
Touches of Winter's cold.

Autumn's voice has spoken
Words of prophesy true,
Winter makes snow of the raindrops,
Frost of the gentle dew.

Life too has her changing seasons,
Spring with her blossoms fair;
Summers of golden promise,
Autumns of sorrow and care.

Buds of the Springtime—blasted,
Hopes for the future—dead,
Autumn brings leaves of purple,
And leaves of crimson and red.

But the snows of Winter cover
The rustling leaves as they lie,
The leaves of gloomy purple,
And the leaves of crimson dye.

So I smoke my pipe in the twilight,
And dream of the seasons gone;
Dream in the present shadows,
Dream of the future dawn.

NOVELS.

SOMEBODY, presumably George Eliot, says that "There is no more infallible characteristic of a mediocre mind than its tendency to indiscriminate generalization." No class of writings has suffered more from this tendency than novels. Whether novels are improving or hurtful; whether young people should be permitted to read them or not, and hundreds of kindred questions are propounded and variously answered, just as if the word *novel* were susceptible of inflexible definition, and covered all the qualities of a great class of books, as diverse in their merits and their influence as men and women themselves! None of these questions can be approached until it is understood what novels are read and how we read them.

Of course, every rule applying to the choice of books in general applies to the choice of this class of books—only before we bring them to bear upon our novels we must "*score them under*," as "Mr. Weller" says. That is to say, as novels take peculiar hold of our imagination and emotion, as they "come home to our business and bosoms," it is peculiarly important that we should refuse to look into such as are bad or of no repute, trashy. It is a good rule to read only standard novels; the masterpieces of Scott, Thackeray, Dickens, George Eliot, a few of Bulwer; his "Harold," "Rienzi," "Last of the Barons," "Last Days of Pompeii," "Caxtons," and "My Novel;" of Charlotte Brontë read "Shirley" and "Villette." It is not easy to omit "Jane Eyre," but I fear a sturdy moralist must include that among the "bad" books, though we are all sure that the gentle and conscientious authoress did not see the tendency of her writing.

Miss Muloch has written good and healthful stories. Charles Kingsley used to say: "If any man wants to be a hero, let him begin by reading 'John Halifax' and 'Henry Esmond.'" There is another of Miss Muloch more heroic than "John Halifax"—the exquisite, pathetic little story of "A Noble Life." But I don't know that I should recommend a course of her writings—there is a little *too* much sentiment, the lover's love is usually almost too prominent, and no books are good for dreaming girls, that ever look toward any ignoring of the dear home affections, which have environed them since their infancy. Trust me, girls, you will never find any admiration more fond and proud than that of a good father, nor any tenderness more perfect than that of a good mother! But, to return to our list. Good Miss Edgeworth has gone out of fashion of late, but, if you will read her "Helen," and "Absentee," and "Eunice," I think you will be very much inclined to browse about among her short stories, and will begin to understand the praises showered upon her by a past generation. With her, one thinks of Miss Austen so valued by literary artists for her inimitable delicate strokes, her "stippling," as an engraver would call it. Of her stories, read at least "Pride and Prejudice," to gain an idea of her fineness of finish. To this catalogue many additions might be made, but is it not long enough to occupy the leisure hours of many a month? And ought we not to be ashamed of wasting our time over the walls and strays of fiction, when its acknowledged masterpieces are within our reach!

There is one class of novel readers, to whom all novels are alike bad; another, to whom, we are almost ready to say all are alike good! The former reads for the story only; to them "all is fish that comes to their net." Could we turn inside out their literary stomach, we would find it like the ostrich's, containing "feathers, nails, hair, bits of glass, and nuggets of gold" in one heterogeneous mass! "Adam Bede" and "Aurora Floyd" are swallowed with impartial appetite. "David Copperfield" and "The Wide Wide World" rank together. These readers care only to know whether Miss A, marries Mr. B——, no matter whether Thackeray or Mrs. Wood tells the tale. It would be ridiculous, were it not so pathetic, to hear one of these omnivorous creatures giving her opinion of some novel, upon which a great author who has spent the best of his heart and brain. "I am *so* interested in 'The Newcomes'", said once one of this class—an apparently bright young girl. I had a regard for the child, and hailed her remark with pleasure. "Tell me what you think of it," I said. "Oh, its *lovely*! Mr. Clive' is so handsome and clever. Only it spoils it to have him marry 'Rosy', and it takes away all the romance to make 'Ethel' a second wife," That was all! who shall say that she might not just as well have spent her time over the poorest dime novel? All the pathos, all the wit, all the tenderness, all the grandeur of the moral teaching, all the grace and beauty of the central figure, that equisite gentlemen, Colonel Newcome, had passed over the reader's pretty blonde head like idle air! What hope is there for such?

Now the novel reader, who really gains something from her book, approaches its characters in this manner. They live before her, she analyses their motives, she sees how and when they might have developed differently, she observes the skill with which the author preserves their identity; and she notes, besides, all the felicities of style, all the beauties of description, all the charms of conversation, all the great lessons so often contained in the lives that speak to us from the eloquent page. And she sees now what is noble and pure, becomes only noble and purer through trial, temptation, and wrong.

When such a reader has closed such a book, think what a step upward she has taken, in mind, heart, character!

To her, and to all like her, ("may their tribe increase!"), a novel is not merely the empty amusement of an idle hour; it is a new force brought into her life; a larger culture, a wider knowledge of humanity, a fresh impulse toward good, a fresh hatred of whatever is low, and mean, and trivial—to say nothing of a new accuracy and elegance in that rare accomplishment, the use of English!

MRS. G. P. RICE.

"YOUR NOSE WILL BE OUT OF JOINT NOW."

MISS CROIX was dandling the new baby sister on her knee and regarding her pink face with a grim smile, which added little to the beauty of her angular face.

"Now Lena, your 'nose will be out of joint,'" she said.

The little one raised her eyes wonderingly, and slowly rubbed her little nose with her chubby hand.

"Lena," said mother quickly, "will you run down and pick mamma two sweet pinks and two pansies?"

Always delighted with such a commission, the little one sprang lightly to her feet, forgetting about her injured nose, but first she peeped into the little crib and said sweetly, "Lena 'll tum back pitty soon to see oo pitty one." Turning to the visitor, she explained: "Baby might try for me," and then she tripped off happily down the stairs.

"Would you spoil all that love and happiness, Miss Croix?" asked the mother earnestly. "Please never say a word to Lena that would set her against her baby sister. I know friends often do such things 'just for fun,' little thinking what mischief they do. Such a shocking account came in the papers lately of a little girl of four whose mind was poisoned against a baby brother until she hated him and often said 'he ought to be tut up.' Sure enough, when she got a chance and no one was near to hinder her, she did cut up his poor little face with a sharp knife, using all her baby strength. Another little boy of whom I have read was stung almost to insanity by the nurse's declaration that now his mother would not love him any more, nor even have him in her room. His mother had been all the world to him before. He could not bear such a rival, so he brought in a large stone and crashed it down on the baby's head as it lay in the cradle. The real murderers were those who had set the little ones against the darlings they should have been taught to love. Here comes mother's little girl with her posies. How sweet they are! By and by baby can hold one in her little hand, and Lena can bring them in for her. And next Summer, perhaps, she can go out to the flower beds herself, and Lena can take care of her." OLIVE.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HATS AND BONNETS; HAIR "YUM-YUM" STYLE.

E. L. TAPLIN.

WHILE it is always prudent to prepare for the summer campaign beforehand, there are many trifles of dress and adornment which it is best not to purchase until the end of Spring. Of course, all the sewing possible should be done before the warm weather, but the little niceties of dress can always be purchased to more advantage later on. This fact is very noticeable in millinery articles. Styles of headgear that obtain in the early Spring, seldom remain in favor the entire season. The picturesque but rather loud "Peek-a-boo" hats worn last year are an example of this. Early in the Spring they were much worn, but so much were they multiplied in common materials that before the season was over they were "slangy" in the extreme. So, when a woman knows that one best hat must content her the entire season, it is not wise to purchase too early.

Requirements in headgear naturally vary with the condition of the wearer; but it may be stated as a sound axiom in dress that two inexpensive bonnets make a better show than one costly article. They need not by any means be cheap-looking. The pretty little capote or princess bonnets are universally becoming, and consequently can never go entirely out of style. They change a little in shape from time to time, but a last year's bonnet does not look by any means out of date. It is rather a delicate matter to say just how many hats or bonnets are necessary; but for a country girl, we may suggest a plain but becoming hat for general wear, a "Sunday-go-to-meeting" bonnet, and a white mull bonnet to wear with a white frock. The three might easily be an extravagance if made by a milliner, but they are surprisingly inexpensive when the wearer can trim them herself.

The prevailing mode in bonnets has a very high horseshoe crown, sloping up in the back, and is trimmed with erect loops of ribbon and aigrettes or stiff feathers. It is pretty and becoming when not exaggerated, but if worn by a woman with a long, thin face, becomes a caricature, especially if the strings are tied under the chin. So, in this case, one of the lower-crowned bonnets must be chosen, with the strings tied on the left side. The trimming must be massed on top, and the loops, though erect, need not be quite so large. With a round or oval face the higher bonnet will of course be most becoming.

The widest latitude is allowed in color, though the craze for yellow has somewhat subsided. Perhaps the most popular of light colors for bonnet trimmings is absinthe green, a delicate and rather trying shade. It is much combined with brown. A little bonnet of rough brown straw may have a few loops of the green ribbon mingled with brown, or the brown loops may be lined with green. In this case it lightens up the bonnet without trying the complexion. Salmon or pale rose pink is very becoming to a brunette, combined with brown in the same way.

The bonnet should, of course, harmonize or contrast effectively with the gown, so she is a wise virgin who selects all her wardrobe with a view to perfect harmony. Naturally this planning is unnecessary when one can afford a bonnet with every gown, an impossibility in the majority of cases.

If in the beginning of the season we settle what color is to be the prevailing tint, we can vary our attire becomingly without extravagance. It is much easier to select a becoming bonnet than a becoming hat. The hats are in many cases very eccentric in shape this season. They agree in one particular only; they are all high-crowned. The prettiest are straight-brimmed walking hats, very becoming to young faces. Comparatively few flowers are used in trimming, the most popular garniture for both hats and bonnets being ribbon loops and stiff feathers. Less of the metallic trimmings are seen this season.

These high hats and bonnets necessitate an accommodating form of hair-dressing, and the most popular form at present is the "Yum-Yum," modeled on the style affected by the three little maids in the "Mikado." It is simple, and requires but little hair. The hair is all combed up high, the entire strand twisted over once, like a French twist; then the back, while in this position, is pulled out loose with the comb, from the nape of the neck, making it loose and fluffy. The strand at the top is divided into two, and rolled into two finger-puffs, which are pinned close together near the front of the head, so as to make one coronet-like roll. The "bang" is rolled back Pompadour-fashion in the middle, with loose curls on the

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria,

sides. This style is very pretty, and sets off a little bonnet, as no other mode would.

A WHOLESOME AND CHEAP DINNER.

Potato Soup.
Round Steak, rolled and baked.
Salad of water-cress.
Apple fritters with sirup.

Cut in slices half a dozen potatoes, and one onion, and fry until they begin to take on a brown color. The fat from the top of the soup pot is excellent for this purpose—failing that, use butter or sweet dripping, but not lard. Turn them into a saucepan with three pints of hot water, and boil until the potatoes are soft. Any bones or trimmings of meat that may be in the larder, may be added, but it is quite possible to make a delicious soup of potatoes without meat. Mash through a colander, and return to the saucepan. Have ready a cup of scalding cream, add a teaspoonful of flour mixed smoothly in cold water, and turn all into the soup. Finish with a tablespoonful of parsley, give one boil, seasoning with salt and pepper, and serve.

Make a dressing as for turkeys and spread a round steak an inch thick with it. Roll up as you would a jelly cake, and tie to keep it in shape. Add a bit of butter and some hot water, and bake until tender, basting very often; season with salt and pepper, thicken the gravy a little and pour it around the meat. Slice it neatly from one end when carving. Baked onions are a nice accompaniment with this meat. Boil them, until tender, in salted boiling water with a little milk added. Then put them in a baking pan with a little of the water in which they were boiled, and pepper and salt, and a bit of butter on the top of each. Give them ten minutes in a hot oven, and put them around the meat.

Water-cresses are a delightful addition to a dinner, and are within the reach of many, if not most, farmers' families. They are healthful and good eaten with salt alone, but a simple French dressing makes a good salad. Cold, boiled potatoes sliced and added make a heartier dish, and for a supper dish with good home-made bread and sweet butter, make about as delightful a meal as any one blessed with a good appetite can desire. The dressing is made by mixing three tablespoonfuls of oil, and one of vinegar, salt, pepper, and a teaspoonful of scraped onion. Pour this over the salad and mix well.

The very nicest fritter batter is made as follows:—Put a heaping cup of flour into a bowl, add the beaten yelks of two eggs, and a tablespoonful of olive oil or melted butter. Stir in a tablespoonful of wine or lemon-juice, and add water a little at a time until it is the thickness of ordinary batter. This is better if set away for a day or two, although it may be used at once. At the moment of frying add the whipped whites of two eggs. The apples should be cut in large, thin slices, and sprinkled with cinnamon and sugar for a few hours before they are used.

A nice sirup is made by boiling, until it thickens slightly, two cups of sugar with one of water and a flavoring of vanilla. Of course, not one quarter of this quantity of sirup will be necessary but it is very nice for pancakes. A plainer fritter batter is made by mixing one beaten egg with a small cup of milk, a little salt, and flour through which baking powder has been sifted, to make a batter.

PALMETTO.

VINEGAR MAKING.

EVERY housekeeper who chooses to do so, can make her own vinegar with very little trouble and at very little expense. In truth, the best of vinegar can be made from what is commonly thrown away.

Apple parings and cores placed in a vessel and covered with warm water and kept warm, will make good, sharp vinegar in from four to six weeks. If a little molasses or sugar is thrown in, it will be deeper-colored and stronger, but it will take a little longer "to turn." A lady once pointed to a two-quart glass jar that stood upon a shelf near the stove, and said: "Perhaps you will hardly believe it, but that gives me all the vinegar I need for my table." Into it she slipped apple parings, and when it was sour enough, strained off the liquid and refilled the jar with sweetened water. This can be done again and again, as the parings do not decay. In making vinegar, be sure to give it warmth and air. Cover the mouth of the vessel with a thin cloth to keep out insects. If one wishes to make it in larger quantities, a barrel should be used. It could be set in a sunny shed and the vinegar making for the year be done in Summer. Sweetened water (using either molasses or sugar) with some common field corn thrown in, will make good vinegar. If it is kept warm it will be ready for use in a few weeks. To 10 gallons of warm water take three quarts of molasses and one pint of corn: or, if corn is not handy, use one pint of yeast instead. Vinegar made either way will keep pickles just as well as cider vinegar. Sorghum is as good as molasses for this purpose. Some claim that soft water must be used; no doubt it is better; but hard water answers very well. Here in Colorado our water is strongly tinctured with alkali and is very hard, and as the rainfall is not to be depended upon, we often use it for vinegar making, with good results.

S. E. H.

SICK-ROOM DIET.

BEEF-AND-TAPIOCA is very nourishing and digestible. Cut one pound of beef small, and cover with one quart of cold water; simmer slowly until the meat falls into shreds; strain and add two tablespoonfuls of tapioca that has soaked for an hour in a little warm water, a sprig of parsley and a shred or two of onion. Simmer for half an hour, season with salt and pepper, and when the soup is ready to serve, put in it a neatly trimmed poached egg, and accompany it with a thin slice of delicately browned and lightly buttered toast. Sago may be used for a change, in which case the soup must be simmered for an hour after the soaked sago is added. You may omit the poached egg, and just before serving stir in the well-beaten yelk of an egg. This may be done without curdling by pouring a cupful of the soup over the beaten egg, very gradually, beating the while, then turn this into a saucepan and give one boil.

A broth made of veal and sago is very excellent for persons suffering from any pulmonary complaint. Have a knuckle of veal weighing about two pounds cracked into pieces; cover with three pints of water and boil in a closely covered vessel for two hours. Strain, skim off the fat, if any, season to taste, and add two tablespoonfuls of pearl sago, previously soaked in warm water for an hour. Simmer for an hour. Have a cup of cream heated to boiling and stir in the beaten yelks of two eggs. Do it slowly to prevent curdling, add this to the soup, give one boil and serve.

For persons troubled with indigestion, beef sandwiches prepared as follows are highly recommended: Chop very finely a piece of tender, uncooked beefsteak, season with salt and pepper and spread between thin slices of lightly buttered bread. Remove the crusts and cut into neat diamonds or squares.

Coax your invalid with cream toast. Cut the crust from two slices of stale bread, and toast an even delicate brown; let half a cup of cream come to a boil, dip the toast in it, and pour over the slices the remaining cream. Brown bread is very nice and healthful prepared as above.

For children who have diarrhea, rice coffee may be partaken of freely. Pour a quart of boiling water over half a cup of rice that has been parched and ground as you would coffee. Let this stand where it will draw for 15 minutes; strain and sweeten with loaf sugar.

NURSE.

A BOILING KETTLE.

YOUNG people usually think it great fun to fuss over any cooking which is all their own. They will carry coffee, eggs, raw potatoes and meat to the woods, build a fire of such sticks as they can gather, and finally sit down in great glee to such a meal as would neither please them nor satisfy their hunger if eaten at their homes, and it is doubtful whether even as a picnic dinner it does the latter, unless pieced out with something bought already cooked.

But perhaps of all amateur cookery, none is more attractive than a kettle of candy. And those who are familiar with the ways of the small folk can tell you that Winter is not the only time when they enjoy a candy-pull, but every season has seen them with sticky hands and faces, bending eagerly over the fragrant bubbling kettle, tasting and testing the mixture cooking therein.

A very nice candy for pulling can be made of sorghum molasses. Allow one half cup of molasses for each one who is to pull. To each cupful of molasses add two tablespoons of granulated sugar and a small lump of butter; then boil until it will harden in cold water. Pour into buttered plates or tins, and pull as soon as cooled enough. It becomes a creamy white if well pulled, and the sugar makes it crisp and hard when cold.

A sugar-candy for pulling is made of two cups of granulated sugar, one teaspoonful of cream-of-tartar, and half a cup of water. After mixing these let them stand a few minutes until the sugar is dissolved, then put the kettle over the fire and boil its contents briskly without stirring until the candy will crisp in cold water. This will be in a very few minutes, and unless carefully watched the candy will boil too much, and return to sugar when poured from the kettle. If it does this, add another half cup of water, let the sugar dissolve again, then boil it once more. The candy may be flavored if desired, adding rose, vanilla or lemon extract while it is boiling. Do not burn the candy and it will be beautifully white when pulled.

In pulling candy, if it is held with only the tips of the fingers and thumb, and pulled each time as far as it will stretch readily, it will be much better than if grasped in the whole hand. Pulled in this way, it will become light and porous, and show a luster that candy crushed in the hand does not have.

Skillful candy-boilers will try to leave no traces of their work on tables, chairs, doors, pump-handles and floors. ALICE BROWN.

News of the Week.

HOME NEWS.

SATURDAY, May 15, 1886.

OF Grant's Memoirs, Vol., 1, 250,000 copies were printed, and several subsequent editions of 25,000 each have been issued. Of Vol. 2 300,000 copies are ready, and extra editions will be got out as demanded. There are 10,000 agents in the U. S., Canada and Mexico, and it is published simultaneously in the U. S. and Europe. If the second vol. sells as expected, the Grant estate will get $500,000 in all out of the work, besides a steady income from sales during the run of copyright.....After a storm last Saturday night in Chicago the sidewalks and streets in and around the Board of Trade electric light tower, were "fairly covered with dead birds of all sorts." The roof of the building was also covered with dead birds, and each of the lamps in the big circle of light was filled with them.....Here's a summary of the work of Congress down to last Wednesday: Bills introduced in the House, 8,740; joint resolutions, 171; total, 8,911. Bills of a private nature which have passed the House, 651; bills of a public nature, 172; total, 825. Of this number 170 private and 49 public bills have passed the Senate. The House has received 381 bills passed by the Senate, 129 public and 252 private. The House has passed 86 bills—33 public and 51 private.....Those deputy-marshals who shot into a crowd in East St. Louis, killing a woman and several men, and who subsequently sought safety from an exasperated people in a jail in St. Louis, were quietly transferred to the prison at Belleville, Ill., Wednesday. Gov. Oglesby sent the requisition for them nearly a month ago; but Gov. Marmaduke of Mo., doubtless to hold them till the excitement across the river had abated, declined to surrender them until after trial in St. Louis for shooting on the connecting bridge—a mere excuse for saving them from Lynch law.....The noted case of Hugh M. Brooks, alias W. H. Lennox Maxwell, charged with the murder of C. Arthur Preller at the Southern hotel in St. Louis on April 7, 1885, was called in the criminal court in that city this week. The body was found doubled up in a trunk in the hotel; and Brooks was brought back a prisoner from New Zealand. A large crowd were attracted to the court-room. The prisoner shows few signs of his long imprisonment and appears cheerful.....The American Tract Society held its annual meeting Wednesday at New York. The number of volumes issued by the society during the year aggregated 59,537,628 pages. The total receipts were $344,420 and expenses $338,632, leaving a balance of $5,888. ....The Millers' Association, embracing about 800 firms in N. Y., Pa., Ind., Md., Va., Ohio, Mich., Ky., Tenn., Ill., Mo., Ia., Kans., Neb., Wis., and Minn., has been in session in Chicago during the week. It hadn't met for five or six years, and was specially called together to agree upon measures to be taken with regard to a patent suit to be soon brought before the U. S. Court at St. Louis. Much business talk, etc.....G. H. Butler, nephew of Gen. Ben., died at Washington on Tuesday. Ex-husband of Rose Etynge; ex-Consul to Egypt under Grant; ex-journalist; brilliant but erratic and too fond of the "flowing bowl"..... ....Charles F. Woerishoffer, one of the greatest grain speculators in the world, died here suddenly Sunday night. Born in Hesse in 1843, arrived in New York in 1865; joined the Stock Exchange in 1870, and since has been a daring operator here and in Chicago. He died carrying 3,500,000 bushels of wheat, 1,500,000 of which he received May 1. He was seldom so "long" of grain, having been generally a "bear," and selling "short" for a fall in prices. .....The nomination of Gen. Rosecrans, as Register of the Treasury, has been "hung up" in the Senate, as there are against him grave complaints of dishonesty in connection with land transactions covering 800 acres near Los Angeles, Cal., and Ben Butler bitterly charges him with having made a hasty, untruthful and vindictive Congressional report charging him with embezzeling $200,000 while in charge of the Soldier's Home at Washington. "Rosy" is likely to have a hard road to travel to the Registership.....Ex-President Arthur is "no worse."....Sec. Manning is "slowly improving," and drives out with Mrs. M. every fine day.....A bill authorizing an arcade railway under Broadway, N. Y., has passed the N. Y. Legislature and been signed by Gov. Hill. It will start from the foot of the island, and on reaching Union Square will branch, one line going to Harlem under Lexington Avenue, and the other striking up Broadway to Harlem near the North River. Ordinary railway cars can run on it. Work to begin in 60 days; job expected to be completed in five years. Lots of capital.....Among other powers, this city is governed by 24 aldermen. Of last year's 24, 15 kept one or more rum-shops, and another was a "fence," or receiver of stolen goods. From the Battery to Union Square, Broadway is 2½ miles long, and the finest street in the world. For years, speculators have been trying to get permission to run street cars on it. A. T. Stewart offered $1,000,000 cash and a yearly percentage of gross receipts for the privilege. Others would have paid more. Jacob Sharp is chief owner and factotum of several street car lines, a burly, unscrupulous man of 64, for years a lobbyist at Albany and a corrupter of local politicians to gain his selfish ends. One of his lines runs cars on Broadway above Union Square, and for 20 years he tried to get the right to run them on lower Broadway. Having secured from the legislature last year an act opening the street to a "surface" line, he had to secure the consent of the majority of the property owners on the street and of the Board of Aldermen. The first he got through a Board of friends appointed by underhand means; the second by the grossest bribery. At least 18 of the City Fathers received bribes of $20,000 to $30,000 for giving the franchise to Sharp for a "song," though the city could have got millions for it. A Senate investigating committee, aided by lawyers ex-Senator Conkling and W. H. Seward, uncovered the rankest and most shameless corruption connected with the "steal." Twelve of the implicated aldermen are under arrest, two are dead, the rest are in Canada or Europe, fugitives from justice. The Legislature has taken the extreme measure of annulling the charter of the road, and virtually handing it over to the city. A Massachusetts bank, in behalf of "innocent holders" of its bonds, is to contest the constitutionality of the acts in the case. Long litigation will fatten lawyers who have been the most unscrupulous agents of, and the largest gainers by, the rascality. Jachne, one of the "boodle" aldermen and the "fence," is now on trial here for accepting a bribe—$30,000 it is said. All possible precautions are taken to prevent "jury fixing;"..... ....The New York Senate, by one majority, has voted $200,000 to lengthen certain locks on the Erie and Oswego Canals—just enough for a beginning.....The total value of goods, the product of Canadian manufacture, exported from the Dominion from the first of July to the first of April of the present fiscal year was $57,098,676, as compared with $59,782,576 for the same period last year. The value of goods imported for consumption in Canada in the same period this year was $72,756,598 as compared with $73,665,255 for the same period last year. The latter is exclusive of imports into British Columbia this year..... Apaches still depredating and murdering in Arizona. Gen. Miles, miles and miles after them. Senator Fair wants them, when caught, to be sent with the rest of their tribe to the Santa Catalina Island, 25 miles southwest of Los Angeles, Cal. They would then need no guard, and their blood-thirsty proclivities could be exercised only on each other. Island to be had for $3 to $4 an acre..... Blaine is very lively just now as a prospective Presidential candidate for 1888. His friends are capturing all the outposts of the National Republican Committee....."Destroyer" is the fit name for a new war vessel, steaming 25 miles an hour, armed with "blasting gelatine" shells which can be hurled 1,500 yards, one being able to destroy any iron-clad afloat. It is claimed the navies of the world would be at the mercy of one such craft .....The House Inter-state Commerce Bill was passed by the Senate Wednesday, by a vote of 47 to 4, after a single amendment by Edmunds, a number of others being rejected. It now goes to the House again, for concurrence in this amendment..... ....In Ohio the seats of four democratic Senators from Hamilton Co. (Cincinnati) were contested on the ground of gross frauds in their election. The Republicans had a majority of the Senate; but lacked two of a quorum; but they could always command a majority if two or more Democrats were present. The Democrats fearing that four Republican Senators would be voted the contested seats, left one of their number to call a count to show a quorum wasn't present, whenever legislation should be attempted, and all the rest rushed off out of the State—to Kentucky and Tennessee,—to escape arrest and compulsory attendance in the Senate. Last Saturday the Republicans spread a report that one had been arrested, and this frightened off the sentinel Democrat, who feared that if he, with the arrested Senator, attended, there would be a quorum. The Republicans at once unseated the four democrats, giving their places to four Republicans. Unless questioned at the moment, legislation in the absence of a quorum is quite binding, and the records are final. The official records have since been stolen, and the Democrats threaten a contest in the Courts. The remodeled Senate has passed the Dow Law, taxing beer-shops $100 and rum-mills $200 apiece..... The National House last week passed the River and Harbor Bill, appropriating $15,120,700 against $12,619,100 last year—by a vote of 142 to 103.....Congressman Morrow, of California, presented in the House a California petition 2,000 feet long, containing 50,000 names, including all the Knights of Labor in the State. It simply requested that Chinese shall forever be prohibited from entering the United States.....A city ordinance of San Francisco prohibited the carrying on of a laundry in a wooden building without the consent of the Board of Supervisors: 2,000 Chinese and 80 white men applied for a permit. The former were refused; the latter got it. The U. S. Supreme Court, on appeal, decides the ordinance is invalid under the 14th Amendment as well as a treaty made with China in 1881,.....The Chicago Inter-Ocean and Tribune have reduced their price from five to three cents per copy....."Influential New Yorkers" are mad because Senator Evarts economically uses postal cards in answering them.....W. H. English, of Ind., of Hancock & English political fame, has retired from his banking business and will travel abroad.....The overland roads have suddenly raised passenger rates so that tickets from this city to San Francisco now sell for $76 to $86 each, instead of $30 a month ago; and $118 before the break. Several hundred tourists caught "short" in Cal., are waiting for remittances from home..... ....The bomb thrown among the police by the Anarchists of Chicago has shaken every labor organization in the country. Of course, honest workmen had nothing to do with the infernal outrage, and all the trades unions and Knights of Labor express horror at it, and detestation of the miscreants who advocate or excuse such dastardly actions; but that deed has severely hurt labor agitation, nevertheless. This morning's Bradstreet, from a multitude of telegrams infers that within about two weeks there have been strikes at leading industrial centers to secure fewer daily hours of labor aggregating 200,000 employés, that 150,000 have secured concessions and that not over 42,000 of the 200,000 strikers have secured their ends. This indicates that over 190,000 employés are working fewer hours per day than one month ago, a small proportion of the total number claiming to be interested..... .... The reduction to eight hours has little of the moral support of the country; but there is a general impression that 10 hours' work is fully enough and anything over 12 hours a great deal too much. All over the country strikes are collapsing, or compromises are being made; and in a few cases the employers in particular lines, combine and have a "lock-out" against their hands until they agree to continue to work on old terms. The clothes makers of Chicago have now a "lock-out" which throws 35,000 hands out of employment. ....This will be a memorable year for storms. During the week cyclones, tornadoes, hurricanes, water-sprouts, rain-storms and every form of bad weather have played havoc over a vast extent of country. Kansas, Missouri, Illinois, Indiana and Ohio, have suffered most severely. A fearful storm of wind and rain swept over Kansas City on Tuesday, causing immense destruction and 29 deaths. Odell and Rockford, Ill; Evansville and Attica, Ind.; Leavenworth, Kans., and innumerable other places in those States have suffered severely. The destruction at Xenia, Ohio, was simply awful; dead and missing 29. Never in the history of that whole section have storms been so wide-spread and destructive. River bottoms are flooded; bridges swept away; crops destroyed; stock drowned; buildings of all kinds demolished or injured—a world of loss, suffering and sorrow.....

FOREIGN NEWS.

SATURDAY, May 15, 1886.

IN England the chances in favor of Gladstone's Home Rule and Land Purchase bills for Ireland, are rapidly diminishing. The Conservatives are, of course, all solidly opposed to both, and enough Whigs and Radicals under Hartington and Chamberlain, are likely to join the Conservatives to be able to defeat the Home Rule Bill, whose fate must be decided the first. Just 110 Liberals are reported to be ready to vote against it, and 30 more are doubtful. Gladstone is seeking to bring back the malcontents by modifying the bill; but they are distrustful and insist on its withdrawal. The Radicals want a confederation of England, Ireland and Scotland, with the chief colonies, each to have separate home governments, like our States, but all to be represented in Parliament at London, as our States are represented at Washington, and they insist that giving a separate government to Ireland, without allowing Irish representation at St. Stephen's, is destructive of such a confederation. Gladstone is thinking of withdrawing the bill for the present, so that the people may be "educated up" to a just appreciation of the case. If defeated, the Prime Minister ordinarily has the option of resigning, and then the "Opposition" assumes the Government; or of dissolving Parliament and appealing to the people by means of a fresh election; but as the Queen has never been a friend of Gladstone, and is strongly opposed to Home Rule, it is hardly likely she would consent to a dissolution. Home Rule for Ireland is likely to be delayed. In that case the Irish "men of action" are likely to begin a series of outrages and disturbances..... The Orangemen of Ulster are arming, and declare they will never submit to a Parliament in Dublin. They threaten to march at once on the Catholics of the other three provinces. Religious bigotry is increasingly used in all parts of the United Kingdom for political purposes.....Very severe industrial distress in the United Kingdom, especially in the manufacturing districts...Great wind and rain storms on Thursday did a world of damage, flooding river bottoms, sweeping away bridges, drowning stock, damaging crops, impeding railroad travel and traffic, etc...For the first time since the death of her husband, in December 1861, the Queen has been appearing prominently in public life, opening exhibitions etc., and this is awakening a good deal of lately dormant loyalty..... ....The resolute action of the Powers has put out the "Greek fire." The bellicose Ministry has resigned; another has been appointed, and a new legislature is being convoked. The troops have been recalled from the frontier and full assurances of peace have been given. It is likely the Powers secretely agreed to bring pressure to bear on Turkey to induce her to yield at least a good part of the territory claimed by Greece. Anyhow, the settlement of the "Eastern Question" is deferred, and the danger to the peace of Europe has for the moment, disappeared.....Germany —that is, Bismarck—still "bosses" Europe. In the Greek trouble France tried to gain undue *prestige* at the expense of the other Powers, by inducing Greece to reduce her forces, on French promises; but Bismarck's strong hand spoilt the game, by using the joint action of the Great Powers—Great Britain, France, Germany, Austria-Hungary, Russia and Italy —as the impelling force. The Great Chancellor has lately ceased all war with the Pope and entered into the friendliest relations with him. What stronger supporter is there of recognized authority and the powers that be, than the head of the Church whose chief injunction is obedience, and which makes unceasing war on all those abominations of constituted authority—secret societies?..... ....In Spain, Austrian Queen Christina, widow of the late Alphonso, and regent of the Kingdom during the minority of her posthumous girl baby, is getting on much better than expected. All fears of Carlist insurrection, republican revolution, or restoration of old Queen Isabella, have ceased, for the present at any rate. A terrible hurricane swept across the country Wednesday, causing a world of loss by destroying houses, crops, etc., and killing a great many people. In Madrid alone, 32 were killed and 620 severely injured..... ....Italy is again suffering from Asiatic cholera—for the third year. Yesterday three deaths and seven new cases were reported at Venice; nine deaths and five new cases at Bari, and one death and one new case at Brindisi. It has also appeared in several other parts of the kingdom. The Pope and the King appear to be getting along better. The fulminations of the Vatican, and the prosecutions of the civil authorities and the outrages of infidel mobs have ceased, at least temporarily..... .....Austria-Hungary and Russia are both busily plotting against, and intently watching Turkey and the recently created little Danubian kingdoms. Both want Constantinople, and are resolved to get it. There's going to be a terrible struggle for it ere long, and the outbreak will probably be begun by some movement of the Danubian puppet kinglings. Little attention would be bestowed on their quarrels were it not that they are supposed to be caused by one or other of the two Powers, with a view to securing some advantage in the way of seizing upon the effects of the "Sick Man of Europe." Hence the importance of the late Greek bluster..... ....On the whole, Europe is a vast camp. The soldier is everywhere. Man at his best is forced from profitable production; trained into a murdering machine; and placed upon the shoulders of toiling labor, to be fed, clothed and pensioned on its scanty and uncertain wages. Everywhere the toilers are discontented and mutinous. A horribly destructive outbreak of miners, metal workers and other operatives, has been just lately suppressed among burning towns and factories, the roar of cannon and the rattle of rifles in Belgium. Numerous riots of striking workmen have lately given a taste of war to the French army. Nihilists are again becoming rampant in Russia. Socialists are multiplying in Germany in spite of iron repression. Discontent is loud-voiced in England, and a few weeks ago was turbulent in London, which for some hours was in the hands of a mob. But the "season" has been unusually gay in Paris. Patti still gets $4,000 or $5,000 a night for singing an hour or so, and the "fashionables" flock to hear her. The theatres are doing a splendid business, etc., etc., etc.

AGRICULTURAL NEWS.

SATURDAY, May, 15 1886.

LAND Commissioner Sparks tells the Congress, that if he is allowed the additional clerks he wants, the entries he suspended April 3, 1885, will be investigated and disposed of within 18 months. A large percentage of these he thinks fraudulent. He still urges the repeal of the Pre-emption, Timber-culture, Timber-land, and Desert-land Laws. "Shall the public lands be protected and honest titles be insisted on, or shall dishonest appropriation be allowed?" "Will Sparks resign?" is a common question. Why should he? To please the land-grabbers? ..At Bulington, Ill., the other day a centrifugal milk separator burst, mutilating and killing the foreman of the creamery. Another like accident occurred there within the week, and we have lately heard of some others in different places. It's like the bursting of a whirling grind-stone driven by steam .....The system of selling stock by live weight is now receiving quite general attention in England and Ireland. British.....India is likely to begin peanut raising.... Tallow in Chicago is 3¾—the lowest price known to the trade. The abundance of cotton-seed oil causes the depression.....Texas is shipping porkers north; a few cars of extra-good have surprised Chicago .....

Crops & Markets.

SATURDAY, May 15, 1886.

THE Washington crop estimates give the wheat condition for May 1, as averaging 95 per cent for the whole of the winter-wheat area, against 70 per cent for the same time last year. There is no marked change anywhere but a slight advance is noted in the Ohio Valley, Missouri, Texas, Tennessee, the Carolinas, Virginia and Maryland. The season has been favorable; and the crop is more advanced than usual. The average in the principal states is: New York 96, Pennsylvania 95, Ohio 97, Michigan 91, Indiana 98, Illinois 92, Missouri 101, Kansas 67. The area sown to wheat in Minnesota, Dakota, Wisconsin, and Iowa is stated by other "authorities" to aggregate 9,700,000 acres, that in Dakota being about 12 per cent greater than last year, with a crop estimated to be about 30,000,000 bushels. All this points to a probable wheat yield of not far from 435,000,000 bushels for the United States this year, on the supposition of fairly good weather between this and the time of harvest. If is now announced that the area seeded to wheat in British India this year is only 1,800,000 acres less than that of 1885—instead of a difference of 2,500,000 acres, as was recently reported. There is now no room to

doubt that the wheat crop of Australia is a partial failure, and it appears probable that the people of that country, including the neighboring colonies, will not have enough for home use. They are already importing some—cargoes having left California, and one been ordered from the Cape of Good Hope, both for Australian ports.

The Department's report says the condition of rye averages 96, of barley 97. Cotton planting has been delayed by cold rain on the Atlantic coast and by overflows on the Gulf coast. The proportion to be planted in May averages 20 per cent. In ordinary years the proportion does not exceed 14 or 15 per cent. The stand is necessarily defective on wet areas; but replanting is rapidly filling the gaps. The proportions already planted are as follows: North Carolina, 53; South Carolina, 82; Georgia, 83; Florida, 94; Alabama, 80; Mississippi, 76; Louisiana, 77; Texas, 84; Arkansas, 75; Tennessee, 77. While the season has been more advanced than usual north of the 37th parallel—the heavy snows of early April in the West and the excess of rain prior to April 15 have retarded spring plowing. It is somewhat more advanced than usual in the States between Maine and North Carolina, and in Wisconsin and Minnesota. Elsewhere in the South and West and the Missouri Valley and on the Pacific coast it is below an average. In the corn-growing States the preparation for seeding is later than in regions where small grains predominate. It is estimated that 72 per cent is done; in average years 75 per cent is the proportion.

The Chicago Farmers' Review summarizes the situation in the wheat fields on May 1, as follows: The only State in which no special improvement is reported is Kansas. The tenor of reports, however, is not different from those of the preceding six weeks. In Michigan the outlook is slightly improved. Many fields look thin, but the plant is generally healthy, and the present outlook is for 85 or 90 per cent.—a full average yield. In Ohio, Indiana, Missouri, Kansas and Tennessee prospects continue flattering. The presence of fly is reported in several counties in Indiana, but no injury from insects is reported in other States. Spring wheat reports from Dakota, Minnesota, Iowa, Wisconsin and Nebraska are of a very promising character. Recent rains in Dakota and Minnesota have left the ground in good condition; the growing plant is reported to have taken a good stand. In Wisconsin spring wheat is just putting in an appearance, while winter wheat is from eight to ten inches high. The reports from Iowa indicate a full average crop.

The Florida strawberry crop is reported to be very small this year, owing to killing by winter frosts, and those of Georgia and Carolina are only moderate; but that of Virginia is probably the largest and best ever grown in that State, growers having increased the area on news of the Florida disaster. Lower Maryland sent some strawberries to this market last week, and a considerable amount has come from there the past week, and a fair abundance from parts further south. Delaware strawberries will be ready for market two weeks earlier than usual, and New Jersey and New York berries, it is thought, three weeks earlier.

Now that the new clip is coming into market, we shall make special note of wool for some weeks to come.

A decided lack of animation continues to be apparent in the seaboard markets. Few manufactures are taking supplies in excess of their wants for nearby consumption. It is somewhat encouraging, however, to observe that among the New England mills there is less talk about strikes and less fear of prolonged labor agitation than a few weeks ago. All accounts from Texas agree in showing a considerable divergence of views between buyers and sellers, and a small aggregate of purchases to date. The prevailing weakness in the situation is well distributed over the various kinds of wool. At Boston, the principal wool market of the country, but little is doing in the way of actual sales, though manufacturers are looking about among the dealers to some extent. So far as prices changed at all the movement is downward. Any buyer in search of a good supply of wool can get it at shaded figures. The current prices for Michigan X and No. 1 combing are about 1c. lower than a week ago, and in other lines values are merely nominal. The sales of the week have been 1,668,000 pounds, against 1,469,200 last week and 2,012,000 the same week a year ago. Leading quotations are as follows:

Ohio & Penn. X.....30@31c.	Fine Ohio delaine..32@33c.
Ohio & Penn. XX..32@33c.	No. 1 combing.....31@35c.
Ohio & Penn. XX and above.....33@34c.	Texas spring, 12 mos.....19@23c.
Michigan X.....28@29c.	Super A .....31@34c.

The Philadelphia market is unsettled and weak. There has been a fair trade in medium wools, which have been in better supply here than elsewhere; but business generally has continued dull. Fine fleeces are especially weak and in relatively large supply.

Wheat has dropped everywhere. The decrease in the visible supply—1,300,000 bushels—is considerably smaller than was expected. Before the storms, reports of crops were excellent, and nothing definite is known yet as to the amount of injury done. The "bears" have been pawing down the market, and Woerishoffer's death threw 3,500,000 bushels on the market, or there were fears that it would. Corn and oats sympathized with wheat. A "bear" week nearly all around in agricultural products.

MARKETS BY TELEGRAPH.

SATURDAY, May 15, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 2⅛c. lower. Corn, steady. Oats, 1c. lower. Pork, 30c. lower.

WHEAT, active; Sales ranged: May, 74⅜@75¼c; June, 75⅜@76⅝c; July, 77⅛@78c; No. 2 Spring, 74⅝@75c; No. 3 Chicago Spring, 64¾@65c. CORN.—May, 34⅜@35⅛c; June, at 34⅜@36⅛c; July, 36⅞@37⅜c. OATS—Sales ranged, May, 28⅛@28¾c; June, 28⅜@28⅝c; July, 27⅛@27⅜c. RYE.—No. 2, 60c. BARLEY—No 2, at 55c. MESS PORK.—May, at $8 75@8 80; June at $8 72½@8 85 July, $8 80@8 95. LARD.—May, $5 87½@5 90; June, $5 90@5 92½; July, $5 95@6 00. BULKMEATS.—Shoulders, $4 10@4 20; Short rib sides, at $5 17½@5 20; Short Clear sides, at $5 60@5 65. CATTLE—Shipping steers, 1,350 to 1,500 lb, at $5 50@6 10 1,200 to 1,350 lb, at $4 60@5 60; stockers and feeders, $3@5; cows, bulls and mixed at $1 75@4 25; stop fed steers at $1 50@4 60. HOGS.—Market strong. Rough and mixed, $3 70@4 10; packing and shipping at $4 00@4 30; light weights, at $3 60@4 15; skips, at $2 50@3 60. SHEEP.—Market steady; Natives, at $2 50@3 20.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 Red wheat is 6¾c. lower. Corn, ½c. lower. Oats, ½c. higher. Butter, creamery, 2c. to 3c.; dairy 3c. to 6c. lower, the fall in both cases being least in the best grades. Pork, 10c. lower. Cattle, 10c. to 35c. higher. Hogs, a trifle lower. Sheep, steady.

WHEAT.—No. 2 Red, Cash, at 80@80¼c; May at 80c; June at 81@81½c; July at 73¾c. CORN.—Weak; No. 2 mixed Cash, 32½@32⅝c; May, 33¼c; June at 33⅜c. OATS—Dull No. 2 mixed, Cash, at 29½@30¼c; May, at 29½c; June, 29½c. RYE—Strong at 75c. BARLEY.—American at 60@65c. BUTTER.—Quiet; Creamery, 16@18c; dairy, 10@15c. EGGS—Quiet at 7½c. FLAXSEED at $1 01@1 02. HAY—Steady; Timothy, $13 50; Prairie, $7 50. BRAN quoted at 52c. at mill. CORN MEAL.—Steady at $1 90. PORK, at $9 25. BULK MEATS.—Long clear at $5 20; Short Rib, $5 25; Short Clear, $5 50. LARD—Steady at $5 70@5 75. CATTLE—Market active and strong; choice shipping and export steers, at $5 50@5 70; fair to good, $4 80@5 30; common, $4 40@4 75; butcher steers, $3 50@4 80; cows and heifers, at $2 50@4 00; stockers and feeders, $3 50@4 60. HOGS.—Market active and steady; butchers' and selected heavy, $4 10@4 15 mixed packing, at $3 85@4 00; light, at $3 90@4 00. SHEEP.—Market steady at $2 50@5 00.

BOSTON.—CORN.—Steamer mixed at 50@50½c., and no grade at 45@49c. per bushel. OATS.—No. 2 white, at 44½@45c.; No. 3 white, 43½@44c, and fancy white at 46@47½c. per bushel as to quality. RYE at 68c, ♑ bushel. BRAN is $15 50@16 for Spring and $17@18 for Winter; fine feed and middlings at $15 50@19 00 and cotton seed meal at $23 25 on spot and $22 25 per ton to arrive. HAY AND STRAW.—Hay is in good demand at $18@20 per ton for choice and fancy; fair to good, at $17 00@18 00; fine, at $16 00@17 00, and $13 00@15 00 for poor and damaged; Western choice, $17 00@18 00; do fair to good $15@16. Straw—Rye, choice, at $20 00@22 00, and for common to good, $14@18. Swale hay, $11@12; Oat straw, at $10@11 per ton. PRODUCE.—BUTTER.—Northern and Eastern creamery, extra firsts, Eastern, new, at —@23c; Northern, firsts, at 21@22c; Western creamery, extra firsts, new, to extra, new, at 21@23c, firsts, 18@19c; Northern dairy, 20@21c. for Vermont extra firsts to extra, new; firsts, at 17@19c; thirds to seconds, at 10@16c; Western dairy, 15@16c; seconds, 9@12; Imitation creamery, 16@20c, for extra firsts to extra; ladle-packed, 14@15c. for extra firsts to extra; firsts, at 11@12c; seconds, at 10@12c; thirds, at 6@9c. CHEESE.—New York, choice to extra, 9½@10½c, per ♑; and common to good, 5@8c; Vermont choice to extra 9½@10c, and common to good, 5@8; Western choice to extra at 7@9c. SAGE, extra, at 14c, per pound. EGGS—Cape and near-by, ♑ dozen, at 13c; Eastern extras, at 13c; do, firsts, at 12½c; Northern, fresh, at 12½c; Western fresh, at 12c; Provincial, 12½c. BEANS.—Choice Northern hand picked pea, at $1 65@1 75 per bushel; do, do, New York, small, $1 50@1 60; do, do, screened, $1 15@1 20; medium choice, hand-picked $1 30@1 35; do, do, screened, $1 12½@1 25; Yellow Eyes, improved, $1 35@1 40; do, choice flats, at $1 25@1 30; Red Kidneys, $1 60@1 65. PEAS.—Canada, common at choice, at 65@95c, per bushel. Green peas, Northern, at 90c@$1; do, Western, $1 15@1 20. POTATOES range at 40@70c, per bushel as to quality.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 15, 1886.

STATE OF THE MARKET.—Compared with cash prices last week, flour 15c. higher; wheat, 1c. to 2½c, lower; corn, 1c. to 1½c. lower; oats, steady; pork, steady; butter and cheese slow and falling; vegetables steady.

FLOUR, FEED AND MEAL, FLOUR—Quotations: Fine at $2 00@3 05; Superfine, $2 70@3 35; Extra No. 2, $3 15@3 60; Good to Fancy Extra State, $3 70@4 25; Common to Good Extra Western, at $3 15@4 00; Good to Choice Extra Western, $4 00@5 15; Common to Fair Extra Ohio, $3 20@3 75; Good, $3 80@4 20; Good to Choice, $4 25@5 00; Common Extra Minnesota, $3 15@3 60; Clear, $3 60@4 00; Rye Mixture, $3 50@3 90; Straight, $4 25@4 50; Patent $4 50@5 15; Bakers' Extra, $4 00@4 50; St. Louis Common to Fair Extra, $3 15@3 75; Fair to Good, $3 80@4 75; Good to Very Choice, $4 80@5 15, Patent Winter Wheat Extra, $4 40@5 25; City Mill Extra for West Indies, at $4 50@4 60; South America, $4 65@4 80. SOUTHERN FLOUR—Common to Fair Extra, $3 25@3 65; Fair to Choice do., $3 70@5 25. RYE FLOUR.—Superfine, at $3 20@3 40, latter for choice. CORN MEAL.—Yellow Western at $2 50@2 75; Brandywine, $2 70@2 75. FEED.—10 to 50 lbs. at 72½@77½c; 60 ♑, at 67½@70c; 80 ♑, at 70@72½c; 100 ♑, at 80@82½c. Sharps at 90@95c. Rye feed nominal at 77½@80c.

GRAIN.—WHEAT.—No. 1 Northern, 88@89c; No. 1 Hard Duluth, 91½@91⅝c; Ungraded Winter Red at 88¾@99c; No. 2 Red, 90@92½c, No. 2 Red for June, 87⅞@88¼c; do. for July, 88¼@89c; do. for August, 88⅝@89½c; do. for September, 89½@90c; do. for October, 90¾@91c; do. for November, at 91½@92 1-16c, do. for December, 92½@93¼c; do. for January, 93¾@94¼c; do. for May, at 97½@98⅝c. RYE.—Canada at 62@63½c Western, 60@62½c; State at 61@66c. BARLEY.—Two-rowed State, 68@80c; Six-rowed State, 78@90c; Canada, 85c.@$1 10. CORN—Ungraded Mixed, at 38@46c; No. 3, 40c, Steamer Mixed, 45¾@45½c; No. 2 Mixed, at 47¼@47½c; Jersey Yellow, 49c; Damaged White Southern, 35c; No. 2 Mixed for May, 47c; do. for June, 46 1-16@47⅜c; do for July, 46¾@46⅞c; do. for August, 46½@46c. OATS—No. 3 Mixed, 36½c; No. 2, 38c; No. 3 White, 41½@42c; Mixed Western, at 38@40c; White do., at 43@47c; White State, 45½c; No. 2 Mixed for May, at 36¾@36½c; do. for June, 35½c; do. for July, 34½c.

PROVISIONS.—PORK.—Mess quoted at $9 25@9 50 for Old and $10 00@10 25 for New; $10 75@$11 50 for Family Mess; $12 00@14 00 for Clear Back; and $9 50@9 75 for Extra Prime. BEEF.—City Extra India Mess, at $16@17; Extra Mess, in barrels, $8 00@8 50; Packet, $8 50@9 00 in bbls.; Fancy Plate, $9 00. BEEF HAMS.—Quoted at $20 87½@20 50. CUT MEATS.—Rib Bellies, at 5½c; 500 Pickled Hams, 10c; Green Hams, 5c, at the West. MIDDLES.—Long Clear in New York, 5½c; at the West, Long Clear, 5.40c; Short Clear, 5.65c. DRESSED HOGS.—All averages quoted at 5¾c. LARD.—Western Steam spot, 6.15c@6.20c; May, 6.16@6.17c; June, at 6.16@6.17c; July, at 6.23@6.24c; August, 6.30@6.31; September, 6.5⅝@6.3⅞; October, 6.43@6.44c. City Steam, 6c. Refined quoted 6.40c. Continent 6.70.

BUTTER.—The market is very slow, while supplies are increasing and prices rule lower. Elgin Creamery, 20@21c, Pennsylvania do., 20@21c.; Western do., best, 20c.; do. do. prime, 18@19c; do. do. good, 18c; State do, pails, 21@22c; State Dairy half-firkin tubs, best, 20c; do, do. do., extra fine, 18@19c; do. do. do., good, 16@17c.; do, do., common, 15c; do, Welsh tubs, best, 18@19c; do, do, do., prime, 17@18c; Western, imitation Creamery, best, 18c; do. do., fair and good, 14@16c; Western Dairy, fine, 15c; do. common, 10@12c; Western Factory, fresh, 15@16c; do. good, 11@12c.

CHEESE.—Exporters hesitate in operations, and there is not more than small lots taken. The situation as to prices is unchanged. Quotations are for: New State factory, best, 8½@8⅝c; do. good, 8¼@8½c; do. fair, 6½@7c do. common, at 4@6c; New Pennsylvania skims, 1¼@13c; Old State factory, best, 10@10½c; do, fine, 9@9½c; do, good, 8@8½c; do. common, 6@6½c; do. poor 3@4c.

POULTRY.—LIVE.—Fowls, near-by lots, per ♑, at 10@10½c.; fowls, Western, per ♑, 10@10½c.; fowls, Southern lots, per ♑, at 10@10½c; turkeys, per ♑, at 9@10c; ducks, western, per pair, at 65c.@90c.; geese, western, per pair, at $1.25@1.50.

POULTRY.—DRESSED.—Turkeys, per pound, at 10@12c.; chickens, Philadelphia, light weights to pair, at 40@45c, per pound; fowls, Pennsylvania, prime, at 12@13c.; do. Jersey, at 12@13c; do State and western, at 11½@12½c. Ducks, Jersey, per ♑, 13@14c; do. western, 11@12c. Geese, Jersey, at 10@12c; do. western, at 9@10c.

POULTRY.—FROZEN.—Turkeys, per pound, at 13@15c.; Chickens, per pound, at 9@10c.; Ducks, per pound, 12@13c.; Geese, per pound, at 9@10c.

GAME.—English snipe, per doz., $1 75@2; Plover, Western, per doz., $1 75@2.

FRUITS.—FRESH.—Quotations are: Apples.—Baldwin, per bbl., at $1 50@1 75; Russetts, Roxbury, per bbl., $1 75@2 00; do. Goldens, $1 50@1 75. Cranberries.—Cape Cod, choice, per bbl., $3 50@4; do. choice, per crate, at 0c.@$1. Strawberries—Florida at 25@30c, per quart for best; do. poor at 15@25c; Charleston, per quart, at 35@45c.

FRUITS.—DRIED.—The quotations are as follows: Apples—Fancy evaporated, at 6¾@7c; choice, at 6¾@6¼c; do. prime at 5¾@6c.; fancy North Carolina sliced, at 4c.; choice do. at 3c.; choice Tennessee quarters at 2c.; State quarters at 2½@3c.; southern sliced prime at 2@2¼c; do. common, 2c. Peaches—Peeled North Carolina, choice, 11@11½c; fancy, 12½@13c; extra fancy, 13½c; Georgia, choice, at 10c; do. prime, 9@9½c; unpeeled halves, 2¾@3¼c; unpeeled quarters at 2½@2¾c.; Delaware evaporated, peeled, 21@27c; unpeeled do., at 12@13½c. Choice pitted cherries at 10@10½c. Evaporated raspberries, at 14@15c; sundried do. 11@12c. Blackberries—Prime at 7c. Whortleberries at 6½c. Plums, at 6@7c; do. California, evaporated at 11c.

PEANUTS.—Quotations at 6c. for best hand-picked, and 4¼@4¾c. for farmers' grades.

COTTON.—The quotations, according to the American classification, are as follows:

	Uplands.	New Orleans and Gulf.	Texas.
Ordinary	6⅞	6 13-16	6 13-16

Shippers desiring to favor us will be furnished stencils, shipping cards, etc., on application. Promptness guaranteed. References, RURAL NEW-YORKER, Irving National Bank, etc.

For Exchange.—Prize Wyandottes, B. Javas and Eggs, and, part cash, for 54-in. Bicycle. Center Table, Rag Carpet, or Lawn Mower. Circular free.
SHUTE & BEHONT, Meriden, Ct.

A Lemon-Colored Woman.

ROCHESTER, N. Y., Dec. 23, 1885.—Three years ago I was confined to my bed in a deplorable condition. Skin as yellow as a lemon. Slightest food would make me scream. Also had prolapsus and ulceration. Treated by physicians for two months. Grew worse. Doctors said it was the worst case of liver trouble they ever saw. Lost forty pounds of flesh. Could not sleep. Improved rapidly under the use of Warner's safe cure. Never was healthy. Would have been in my grave had it not been for the wonderful powers of Warner's safe cure. Am now perfectly well. —MRS. J. J. BAYNE, 52 Lake avenue.

IT PAYS to sell our Rubber Printing Stamps. Samples free. J. M. Millen & Co., Cleveland, O.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.

AS AN EVIDENCE OF FAITH

in my remedy I make the following offer:

I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.

1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.

2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.

Facts are Better than Assertions.

Please read the following testimony:

GIBSONTON P. O., PA., Feb. 2, 1885.

Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*

Yours very truly, WHITE & CO.

[N. B.—White & Co., since writing the above letter, have purchased $150 worth of the remedy.]

The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

JOS. HAAS, V. S.
Member of Indiana State Veterinary Med. Associat'n
INDIANAPOLIS, IND.

LOOK out for bilious fevers in the spring, and prevent them by unloading the liver and kidneys, and restoring them to healthy action by Warner's safe cure.

For the Young.

LETTERS FROM THE COUSINS.

DEAR UNCLE AND COUSINS: Spring with its work is here, and I suppose that you are all busy. We have had plenty to do, but I will take time to write a short letter to you again. Although the summer season brings a great deal of hard work, it also brings the birds and flowers, which any of us may study during this part of the year. If you wish to study the habits of birds, provide yourself with some blank paper, or, better, a small blank book in which you may record your observations. First, you will notice the bird. Give its size and color, length and color of its bill and also the shape of the bill, whether straight or curved, long or short, round or flat, etc. Give also the different markings of male and female, and ascertain whether the male sits on the eggs at any time during the hatching of the eggs. Note the time at which the bird first appears in the Spring, and also at which it leaves in the Fall. Second, examine the nest and eggs on the following points: form of nest, diameter, depth, materials used in its construction when found, where placed—whether on the ground, in bushes or trees, and if on trees, whether near the body or at the ends of the branches, and in all cases the distance from the ground, and the kind of tree or bush—number, size, shape, general color and markings of the eggs, and the time of hatching. There are other interesting points in this quest for knowledge, such as the following: What is the principal food, how obtained, where may the food be most easily found, whether they are the friend or enemy of the farmer, etc. It is not likely that you can learn all of this in one season, but if a record of each season's observation is made, the bird will become well known in time. You can study this while going to and from your work on the farm, or on bad days when it is too wet "to plow or sow, to reap or mow," and you will find pleasure in it. If you do not know the name of the bird, give it a number in your book, and perhaps you may learn its name sometime in the future. Those who wish to study plant life can form a list of points which they wish to examine, and carry it out in the same manner. Uncle Mark will please accept my thanks for the sweet peas. We had a small bed of them last year, and they gave greater satisfaction than many more costly kinds would have given. I raised 13 or 14 grape-vines from seed sown last Fall a year ago, and I succeeded in bringing 11 of them through the Winter, by laying long grass and short brush across the row, and throwing dirt on the ends of these to keep the wind from blowing it away. The buds were nearly all colors, ranging from light green to bright red.

Ohio. URSA MAJOR.

VARIOUS TOPICS.

IN the R. N.-Y. of April 17th, E. M. D. writes, "Will some of the Cousins tell me how they save Pansy seed?" I do not understand what constitutes a genuine Uncle Mark's Cousin; however, as I am a subscriber to the R. N.-Y., and have just celebrated the anniversary of my 13th birthday, and have noticed no reply to the above request, I will venture to tell my way. I visit my Pansy bed once or twice a day and pick off all the seed pods that are holding their heads straight out. These pods will usually be a lighter green than the unripe ones with bent necks. I put them in a glass dish, use a pane of glass to cover them, and set them in a sunny place. If left uncovered, many of the seed will be lost when the capsules open. I also pick my Phlox Drummondii just before the seed is ready to snap out, and treat in like manner. The information desired about hyacinths, B. K. Bliss tells all about in his Fall, or Bulb Catalogue for 1884-85, also Peter Henderson in Fall Catalogue for 1882-83. I thank Uncle Mark for ever so many good hints; also both U. M. and Herbert Green for their bee letters. I made several dozen of the Old Gardener's screens, planted some lettuce as soon as the ground could be worked, and put the screens over half of the bed. Have frequently watered the uncovered half with liquid fertilizers, but it cannot keep up with the half under the screens. Some of my Rural Treasures are up and growing, but I am almost sure I have failed with the Canna seed. I tried a warm soapstone for bottom heat. Perhaps a "brooder" would have induced them to come up. The one Ricinus seed found among the Treasures is growing finely. If there is no objection I would like to join the Y. H. C. A. E. WAKEMAN.

Moodus, Conn.

[We are glad to have you join. Thanks for the letter. We hope to hear from you again.]

DEAR UNCLE MARK: I would like to join the Y. H. C. We have been taking the RURAL five years and we like it very much. I raised some potatoes, sweet potatoes and onions last Summer. I have planted some White Elephant and Blush potatoes this Spring. I have two ducks and a little pig. We have nine horses, 21 head of cattle, 21 pigs, 90 old chickens, and 30 young chickens. We have planted six acres of potatoes and will plant about 10 acres more. If I am accepted as a Cousin I will write again. JAMES H. TREGEMBA.

Carbondale, Kans.

DEAR UNCLE MARK: I have been very much interested in reading the cousin's letters, and would like to join the Y. H. C. My Papa is a Canadian farmer and we have taken the RURAL for a good many years. I am 11 years old, and attending school every day. I am studying very hard now, preparing for the entrance examinations to the High-school. I am also taking music lessons, so you see I do not get much time to help with the farm work, but I like to care for stock, especially the horses. Yours truly,

LESLIE R. BRIDGEMAN.

Smithville, Ontario.

DEAR UNCLE MARK: I want you for my Uncle as well as the rest. I am a little girl 11 years old. My Pa does not take the RURAL NEW-YORKER, but Grandpa does and I read it. I am going to have a garden next year of my own. I have two sisters and one brother and we have 50 chickens to take care of. We have two horses and one colt. And we have also a cow and two calves. I have some flower seed, but not very many. The pigs destroyed my flowers last year. From your niece,

Marshall Co., Ia. HETTA M. HAUSER.

DEAR UNCLE MARK: Thank you very much for the seeds you sent me. Mamma always has a hedge of sweet peas between the flowers and vegetable garden. Last Summer the grasshoppers ate the seed pods, so we could not save any seeds, so the sweet peas were very acceptable. My Papa is in the sugar bush, and I wanted to go too; but as it rained, Mamma thought I had better stay at home and write to you. We make sugar from 900 trees. We have had good times eating sugar and wax. As we have had so much snow this Spring; and, oh! such fun as we have had making candy out of wax. Don't you wish you had been here to help us? I do, but I suppose you have to stay and attend to business, reading and printing our letter, instead of having fun. We keep 36 cows, and last week we had 24 calves at a time, two of them twins.

From your friend, WILLIE W. HUNT.

Chagrin Falls, Ohio.

[I am a little glad it rained so that you could write to me. I guess I do wish I could go out to the sugar bush. We get the best fun we can out of work. We can make work as pleasant as play if we will only think so.—U. M.]

DEAR UNCLE MARK: I like to read the letters from the Cousins, and also what you say. We have had some very cold weather this Winter. Once the thermometer showed 35° at another 38° below zero. My Mamma's health is not very good, so we are living here, for a while, near Grandma's, to give her a chance to recover from a very long and severe sickness. My Papa is in Texas. He likes it there, because he is not troubled so much with asthma. I have a large, fine, Newfoundland pup, several months old. His name is Rollo. He is bright in learning what he is told. I have also some very beautiful young hens. They are partly Plymouth Rock and partly Poland. Some are all Plymouth Rocks and one is all Poland. The mixed ones have the plumage of the Plymouth Rocks and the comb and topknot of the Polands. We think they are very fine birds. A friend made me a present of a trio of Bantams, Nicky, Nip and Tuck. My rule is to clean my house every day, and my yards every other day. Not quite two years ago, Mamma bought four setting hens, two Polands and some eggs, and offered me the chance to get some by taking care of them. Since then we have raised more than 200 chickens. Out of my share I have bought several things, and have saved five dollars and fifty cents to buy a calf or a colt. Should we sell and go to a warmer country, I should like to try the Leghorns. But do not think I am all chicken. I like to study and read too. I study with Mamma, and I like to read History and Biography. "Cousin Horticola" will find some white water lilies at the head of the lovely lake, which gives our town its name, if he can come so far to get them. Your friend,

HENRY C. ANDERSON (11 years old).

Clear Lake, Iowa.

[You have learned the first secret of success in poultry raising. The houses and yards must be kept clean, or much of our care will be useless. To be "all chicken" is not the worst thing in the world, still I am glad you like other things too.—U. M.]

Miscellaneous Advertising.

THOUSANDS OF PEOPLE suffer in silent patience from diseases of the bladder. If there is anything more distressing among chronic diseases, medical literature has not yet revealed it. A newspaper is no place in which to describe the particulars of the agony. Every victim knows it for himself, but every victim does not know what thousands have testified to: that when all other remedies fail, they have been restored to health by means of Warner's safe cure. This great specific corrects the action of the kidneys, drives the uric acid irritant from the blood, reduces the congestion, and after a thorough course of treatment the formation of mucus ceases, the elasticity of the bladder returns, and health and happiness are regained.

THE WESTINGHOUSE CO.,
Schenectady, N. Y.

Blood Will Tell.

CINCINNATI, Ohio, Nov. 17, 1885.—In April, 1881, my daughter was taken sick with complication of symptoms. She continued to grow worse under the best medical treatment. Only temporary improvement. Had a relapse, grew rapidly worse, and at this time, had palpitation of the heart, intense pain in the head, nervous dyspepsia, and physicians said, catarrh of the bladder. She fell away from 135 pounds to less than eighty. Began to use Warner's safe cure and Warner's safe pills, together with Warner's Safe Nervine. In ten days she was much better, and in 100 days after she gained fifty pounds in weight, and was restored to good health.—JOSEPH THORNTON, Room 9, Johnson Building.

PILES. Instant relief. Final cure in 10 days, and never returns. No purge, no salve, no suppository. Sufferers will learn of a simple remedy, free, by addressing C. J. MASON,
78 Nassau Street, N. Y.

Brewster's Patent Rein Holder.

RICHMOND CHAMPION FENCE MACHINE
Patented Nov. 24, 1885.
Surpasses all other wire and picket fence machines, for making strong and durable fences in the field, that no stock will break down. On rough, hilly ground, it keeps pickets perpendicular which no other machine will do without constant adjustment. It is easy to handle, uses any kind of pickets, and any size of wire. Write for circular and price.

PERSONALS.

GENERAL BELKNAP, ex-Secretary of War, has lately been suffering much from rheumatism.

GENERAL NEAL DOW devotes much of his time to literary work. He is preparing to bring out a history of Prohibition.

SENATOR JONES, of Florida—and Detroit—was greatly infatuated with Miss Anderson when that lady last played at Washington.

SOME people are mad because Miss Folsom is buying her wedding trousseau in Europe; but what do they think of the American girls who buy their husbands, too, in Europe?

FROM his Duchy of Cornwall the Prince of Wales last year received the sum of $474,515. Of this he returned in various payments $435,510, so that his net revenue was only $39,005.

SAMUEL J. TILDEN is quoted as saying that a bachelor President in the White House is an incomplete President, and that he is glad to know that Cleveland is going to wed.

A SPECIAL from Mississippi City says that Jefferson Davis has been confined to his room since his return home and is under the care of several physicians. He will recover.

REPRESENTATIVE GEORGE TALIAFERRO BARNES, of Georgia, otherwise "Br'er Tarrypin," is said to be the biggest man in Congress, weighing 300 pounds and measuring five feet five inches in diameter in every direction.

DR. MCLAUGHLIN, of Texas has, just reported to the Medical Association of that State that he has discovered the microcobes of Texas fever, small-pox, yellow and dengue fevers and of other ferbile diseases.

PROF. PRITCHETT, of St. Louis, has discovered that our days are lengthening, but as it is only at the rate of two seconds in a century it will be some time before the extension comes in conflict with the eight-hour movement.

THE chances of Gov. Rusk, of Wisconsin, for renomination were excellent anyway, but since he snppressed the Milwnukee riots he is getting an added boom. His "this thing has got to stop, if it takes every man in the State" struck the popular heart.

EX-SENATOR David Davis, of Illinois, is dangerously, and it is believed fatally, sick at his home in Bloomington. Within the past week a carbnncle has developed on his left shoulder, and this week George P. Davis, the Senator's son, admitted that he believed his father to be on his death-bed.

AFTER a long struggle and many rebuffs, Mrs. Carrie B. Kilgore, wife of a Philadelphia lawyer, has been admitted to full fellowship at the bar by the Supreme Court of Pennsylvania, and can now practice before all the tribunals in the State—the first woman who has obtained the right.

SENATOR ALLISON, of Iowa, talked of a good deal lately as a possible Republican candidate for the first or second place on the next Presidential ticket, is the last prominent man whom the newspapers want to marry—to a handsome young lady of Washington.

EDITOR HENRY WATTERSON, of the Louisville Courier-Journal, who was lately sick well-nigh unto death, sailed for Europe Wednesday. He is looking well, and plans to spend the Summer in England and Switzerland and the Autumn in Paris, and to undertake no professional labor until his strength is fully restored.

JUSTICE STANLEY MATTHEWS, of the U. S. Supreme Court, is soon to marry Mrs. Mary K. Theaker, widow of Judge Theaker, who died two years ago at Deer Park, Md. He was a Congressman from Ohio, and Commissioner of Patents under Lincoln. She is described as "a charming and attractive person" and of "deeply religious convictions, a sincere and reverent Presbyterian."

"THERE'S another pig dead, and now away I go, too," exclaimed farmer Rezer, of Clarion Mills, Pa., Tuesday, just as a third pig died of some disease, during the week. He went straight to his bed-room; his wife ran after him, but was too late to prevent him from cutting his head nearly off with a razor. He was 37, and had never shown any signs of insanity.

GENERAL LORD WOLSELEY, the lucky Irishman who bravely retreated before the Mahdi, and who is reported to have threatened to resign from the British army to head an Ulster rebellion in case home rule is conceded to his native land, has lately received the Grand Cross of the Order of the Red Eagle from Kaiser Wilhelm.

THE widow of Commander J. A. M. Craven is poor and asks an increase of pension. When the monitor Tecumseh, leading Farragut's fleet in Mobile Bay in 1864, was struck by a torpedo, Craven and the pilot were in the turret and both ran to the small opening leading below. The Commander, however, drew back, saying: "After you, pilot." There was no "after" for him. The pilot was saved, but the hero went down with his ship,

Miscellaneous Advertising.

THE depressed, anxious, tired, prostrated feeling, with disposition to chills and fever, headache, malaria and nervous prostration, indicate that the blood is full of uric acid, which can be effectually remedied by that great blood purifier, Warner's safe cure.

POST HOLE DIGGER.

The **Greatest LABOR-SAVING** tool ever invented for digging holes in the ground. This machine works on a new principle, and is unlike anything in the market. It is neither an Auger nor a Plunger, but is driven in the ground with a driving rod, which works in a pipe similar to a telescope. **We claim** for this tool:

1st. That one man can dig from **one to three hundred** holes two feet in ordinary ground in one day.

2nd. That it will dig holes any **size or depth** required.

3d. That it will work successfully in **very hard or rough** ground where other diggers and augers will not work at all.

4th. You stand up straight while using it, consequently no back-breaking work is required.

It will pay you to send for descriptive circulars and prices to **COLE & FLEMING, Manufacturers, Springfield, O.**

Any one sending a club of seven is entitled to one copy, one year free.

Agents will be supplied with canvassing outfit on application.

Entered at the Post-office at New York City, N. Y., as second-class mail matter.

Humorous.

"YES," said a fashionable lady, "I think Mary has made a very good match. I hear her husband is one of the shrewdest and most unprincipled lawyers in the profession, and of course he can afford to gratify her every wish."

A LITTLE girl asked, during a hail storm, "Are the angels popping corn?" The same child asked, after attending the service at a Quaker church, one cold morning, "Why don't they think at home, instead of going to church and wasting fire?"

TWO "gemmens" in Austin, disputing as to the "properest" way in saying, "We eated at de table;" or "we has done ate at de table," called on Uncle Moses to decide. His answer was: "In de case of you two niggahs, none of you am right. De properest way for sich cattle as you am is to say "We fed at de troff."

A CERTAIN judge, who had been a great scamp years before his accession to the bench, recognizing an old acquaintance in a prisoner brought before him, and supposing himself safe from recognition, asked the prisoner what had become of the companions of his early life of crime. The reply was, "They are hanged, your honor, except you and me."

MISS ANGELINA to Miss Belle, her rival, just now surrounded by a bevy of admirers: "Oh dear, do tell me how you do your hair up so charmingly. What do you do it up on! It looks so intellectual?" Miss Belle, who wears her hair high: "Well I'll tell you, dear. I generally do it up over brains, and (sweetly) I don't think you can buy them at the hair stores."

"FANNY, you should not beat your doll with that heavy stick. You will make all the saw-dust come out of it," said a Michigan mother to her little girl, who had placed her doll on the ground and was belaboring it with a base-ball bat. "I don't care if all the saw-dust does come out of her,' replied Fanny; "I don't want people to say that my children turned out bad because I humored them too much."

AS they were all coming out of the theater together, young Sypher accidentally trod on the dress of the pretty girl just ahead. "Oh, shoo!" involuntarily exclaimed the pretty young girl, as she suddenly brought up. Young Sypher thought he saw a chance for a brush. "You needn't shoo me," he simpered, smartly; "I'm no cow." "No," the pretty girl returned, with a glance that pinned him up to the side of the lobby, "perhaps not, now, but you will be when you grow up." Then she swept on, while young Sypher was so astounded that he actually forgot to light his oakum-stuffed cigarette when he got outside.

"WE MET BY CHANCE!"

CORNELL UNIVERSITY.
AGRICULTURAL DEPARTMENT
In the year 1886-87 courses of instruction will be given as follows:
In Agricultural and Applied Chemistry; Professors CALDWELL, SCHAEFFER and NEWBERRY: 8 Courses.
In Botany, Horticulture and Arboriculture; Professors PRENTISS and DUDLEY: 11 Courses.
In Entomology and General Invertebrate Zoology; Professor COMSTOCK: 7 Courses.
In Geology; Professor H. S. WILLIAMS: 3 Courses.
In Veterinary Science; Professor LAW: 3 Courses.
In Applied Agriculture; Professor ROBERTS: 6 Courses.
During the present year a course of lectures is given on the Management of the Dairy by the Honorable L. B. Arnold; a similar course may be expected next year.
A veterinarian building is to be erected in the course of the present year, and four rooms are to be added to the Agricultural Laboratory and Museum.
The University Farm contains 257 acres, of which about 125 acres are in tillage. The farm contains two very large barns, a dairy house, and an excellent herd of stock. All the appliances of the Farm are used chiefly for the purposes of illustrative and experimental husbandry.
Students who take the full course and pass the requisite examinations receive the degree of Bachelor of Science in Agriculture.
Students not candidates for a degree are received without examination as "Special Students" and are admitted to any or all of the above courses, provided the applicants are 18 or more years of age; and provided they satisfy the Professors of Agriculture of their disposition and ability to profit by the instruction.
The next collegiate year begins September 14, 1886!
To all students of Agriculture "TUITION IS FREE."
Full information sent on application. Questions concerning courses of study should be addressed to I. P. ROBERTS, Professor of Agriculture; all other questions to E. L. WILLIAMS, TREASURER,
CORNELL UNIVERSITY, Ithaca, N. Y., May, 1886.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1896. NEW YORK, MAY 29, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Herdsman.

POLLED CATTLE.

IN the original struggle for existence among wild animals, the possession of horns, as offensive and defensive weapons, was undoubtedly an advantage to cattle, and whenever in the case of any animal any advantage occurred in size, shape, texture, or solidity of these weapons, it would be likely to be perpetuated, owing to the superiority it would give its owner in the battle for life with its kindred and other wild animals. But, however useful horns may have been in a wild state, in a state of domestication they are not only useless, but a source of danger, mischief and inconvenience. Prejudice and the endearment of association will, for a considerable time yet, lead many to prefer horns; but the admirers of "no-horns" are steadily and rapidly increasing, and doubtless will soon be, if they are not already, in the majority. One of the greatest hindrances in this direction is the difficulty stockmen experience in dissociating their favorite breeds from horns. What Shorthorn, Hereford, Devon, Ayrshire, or Jersey man can readily imagine his favorite breed without horns? As polls they would naturally appear something different, and would lose the place they hold in his regard; for the true lover of any breed admires not only their acknowledged excellencies, but all their special characteristics—even their defects, as in the case of horns. Wouldn't any of these fine breeds be really more valuable without horns, if with their horns they lost not a whit of their other characteristics?

Hornless cattle are generally milder than others in disposition; are less likely to injure man or beast, and can be shipped closer without injury. Can any stickler for any horned breed mention any advantage in the way of beef or milk production secured to his favorites by the possession of horns?

Polled or hornless cattle have been found in many widely separated places from time immemorial. Those of Great Britain were known to the Romans in the days of Julius Cæsar. They are all supposed to have been originally horned, and the change is attributed by some either to the natural conformation of the country where the breeds originated or to the effects of selection in breeding, or to a combination of both; while others think it due mainly to "sporting" or unaccountable variation from the ancestral type in some animals, and the perpetuation of this variation by design or circumstances. Certain it is, as we learn from D'Azra, that "in 1770 a hornless bull was produced in Paraguay which has been the progenitor of a race of hornless cattle that have multiplied extensively in that country." If such has been the origin of the Paraguayan polls, why may not the other hornless breeds have originated in the same way? "Muleys" have never been very uncommon among horned cattle.

Of the present recognized breeds of polled cattle the Galloway is probably the oldest. Its original home is in the counties of Wigton, Dumfries, and Kirkcudbright, forming the ancient kingdom or province of Galloway in the south of Scotland. The predominant color is black, though some are tawny, red, brown, or even dun; and others have white faces and are sometimes marked with white on other parts. They have always been noted for their excellent beef qualities, a writer in the sixteenth century speaking of them as "fair ky and oxin of quhilk the flesh is right delicious and tender," and the Galloway rib is a favorite with epicures to-day. They are symmetrical and compact in form; the skin, though thick, is soft and mellow; the hair long and silky; the flesh well and evenly distributed. They are straight and broad across the back, with short legs, long sides, well-sprung ribs and well-rounded hips, and very vigorous and hardy. The cows are poor milkers and soon run dry; but their milk is rich in butter. This shortcoming is greatly due to the custom of allowing the calves to suck their dams as long as they gave milk, and to the fact that it is as butchers' animals they have always been chiefly valued, so that little or no attention has been given to milk production. Lately they have been less numerous in their original home, having been, to a considerable extent, superseded by the Ayrshires, as the farmers have been devoting more attention to the dairy. Formerly great numbers (often 30,000 a year) were driven south to be "finished off" for the London market on the rich pastures of Leicester, Norfolk and other eastern counties, and the shipments are still heavy by rail and steamer.

LADY FULTON 2D. From a painting by C. Palmer. Fig. 229. (See page 350.)

The Polled Angus or Aberdeen—which the American breeders agreed, less than two years ago, to call Angus-Aberdeen—are in many points like the Galloways, but larger, flatter in the side, thinner in the shoulder, and longer in the leg. Being originally accustomed to a more humid climate and better treated when calves, they have a finer though hardly smoother skin, and a less rough coat of hair. They are also better milkers, though as they have been almost invariably raised for beef, and little care has been given to the development of their milking capabilities, their yield, though rich, is considerably less than that of the Ayrshires and other dairy breeds. They are very hardy, good breeders, mature early, fatten quickly, and can "rustle" for themselves almost as well as the Galloways. The prevailing color is black, though some are a kind of yellow or dun. Great numbers of them used to be driven as Galloways to the south of England, and their meat is considered prime in the London market. Their success as prize-winners at the Paris Exposition of 1878, gave them a great "boom," which the breeders were not slow to make the most of. Some think the Angus-Aberdeen and Galloway were originally identical, and that the differences now noticeable are due to differences for generations in their environments; others are of opinion that each originated in its own section.

The Norfolk Polled Red is generally supposed to have originated from selections made by the Norfolk farmers from the best Galloways grazing on their pastures. Those were bred for milk as well as beef, and hence a greater development of the milking capacity. This origin, however, is denied by many who insist that the race originated in the county. Suffolk has had from time immemorial a breed of red polled cattle, excellent butter makers. It is known that there were frequent crosses of Suffolk bulls on Norfolk cows, and according to Marshall, the result was an "increase in size and improvement in form." No doubt it was in this way the present breed of Norfolk and Suffolk Red Polls was formed. Since 1846 both counties have competed with stock known by this name at dairy and fat stock shows. They are of a rich red color, with the udder of the same shade; but the tip of the tail may be white. They are excellent milkers, fatten readily, make prime beef, and combine in a high degree the two leading objects of beef and milk production.

Some years ago a hornless breed called the Jamestown, was originated in Massachusetts by a cross of a pure-bred Jersey bull on an imported Norfolk and Suffolk Red Polled cow. The sire was from Motley's Flora, imported in 1851 by the Massachusetts Agricultural Society, and the dam was brought over from Ireland in the relief steamer Jamestown, on her return after conveying a cargo of provisions to the starving inhabitants during the famine of 1847. The progeny of the cross was

the polled bull Jamestown (called after the vessel), which gave his name to his polled progeny. The family was kept up by crosses on Ayrshire and Jersey cows, the hornless calves only being retained, until it grew numerous enough to be perpetuated without admixture of other blood. In 1878 it was recognized as a distinct breed by the Norfolk Agricultural Society (Mass.), and it was described and illustrated in the RURAL of January 22, 1881; but of late we have heard little or nothing about it.

LADY FULTON.

THE head of this beautiful cow is illustrated on our first page. She is a cross-bred animal, being three-fourths Red Poll and one-fourth pure Devon, bred and owned by L. F. Ross, Iowa City, Iowa. To our mind she carries the marks of her Devon blood in her face and head. She is a fine cow, one of the best in a noted herd. These cross-bred cattle are said to be, in some respects, superior to thoroughbreds of either breed. The potency of the polled breeds in producing hornless calves is most marked. Mr. Ross states that he produced a herd of "home-bred polls" by crossing the Devon and Short-horn on the native polled or "muley" cattle of Illinois. A polled bull produced in this way, though three-eighths Short-horn and one-half Devon, got polled calves without exception, and his progeny inherited this characteristic. Much experimental breeding has evidently been attempted in this herd, and with good results.

The Poultry Yard.

THE GAME AS A FARMER'S FOWL.

THOMAS W. LUDLOW.

INDEPENDENTLY of its great beauty of feather and its courageous disposition, the Game fowl combines important advantages for farmers, whether bred pure or used to grade up common barnyard stock. For farmers' purposes, the Exhibition Game is preferable to the Pit Game, which averages smaller in size than its more showy cousins, and lays, as a rule, smaller eggs. Of Exhibition Games, the best varieties for practical use are the Black-Breasted Reds and the Red Piles; although some strains of Whites and Blacks are also good. The beautiful Duckwings are less to be recommended to the farmer, inasmuch as they are seldom so large as the Black-Reds and the Piles, and, although one of the most prolific of fowls, their eggs are usually decidedly small.

There is very little, practically, to choose between good strains of Black-Reds and Red Piles, except the color. If sought for crosses on common stock, the former will give results more agreeable to the eye where the prevalent color of the flock is dark, and the latter where the birds kept are white or nearly white. Cocks of these varieties of Games frequently weigh over nine pounds, and hens not uncommonly attain the weight of seven-and-one-half or eight pounds. Thus, while making no claim to rival the sluggish Asiatics in size, they are well up to the requirements of a fowl of medium weight. The meat, too, is placed where it is most sought on a chicken—on the wings, and on the round, plump breast which is characteristic of the Game fowl, and is preserved in large measure by Game crosses. This meat, too, firm, tender, and fine of grain, is superior in flavor, perhaps, to those of all other varieties of chickens, not excepting the Langshan which is admirable in this as in almost all other respects.

As egg-producers, the Black-Breasted Reds and Red Piles have an enviable record. Their white, delicate-shelled eggs are of very fair size, and from many strains even large; and they are produced in great plenty. It is safe to say that these Games will push the Leghorns very hard in the number of eggs laid in the year, and that in Winter with the ordinary care, they will lay many more than Leghorns under the same conditions. Again, while if left with free range, the Games are unexcelled foragers and will provide for themselves in Summer and Autumn nearly the whole of their keep. If confined in even a small yard, they are entirely contented and continue to thrive and to lay when many strains of Leghorns would pine away for their lost liberty. It is an opinion very commonly held that the eggs of the Game are superior in flavor to those of other breeds.

The Game hens are excellent sitters, and if treated with gentleness they are very docile and submit without fuss or flurry to being handled. As mothers, they are very careful of their chicks, seldom trampling them to death, as the clumsy Asiatics do so commonly, and frequently they seem even to exercise a thoughtful consideration for the needs and powers of endurance of their broods. The chicks grow and feather very fast. Like all quick-feathering varieties, they are delicate until well feathered, but no more so than Leghorns; and as soon as they have become well covered with feathers so that the extraordinary drain on the system of providing so abundant a growth is checked, neither common barn-yard chicks nor chicks of any other pure breed are hardier.

In conclusion, the elegant form, close feathering and brilliant coloring of the Game are by no means disadvantageous, even to the strictly practical man. Few of us are wholly indifferent to beauty; and the poultry-yard can have no more beautiful occupant than a thoroughbred Game, whether it be the cock in his resplendent garb, or the hen in her more sober, but strikingly neat dress. The courage of the Game fowl, too, is not the least of its many good qualities. Both cock and hen will forcibly withstand a marauder, and will cope, not seldom successfully, with a hawk having sinister designs upon the little brood. The sneaking rat has not rarely had his skull laid bare by a blow from the beak of a mother Game which he has sought to deprive of her chicks. The writer has himself seen a little Exhibition Game cock of nine weeks save his life when attacked in an open field with no refuge attainable, by a rapacious cat. Instead of seeking hopelessly to flee, the little fellow ruffled up his feathers, faced the cat as she crouched for the fatal spring, and flew at her again and again with punny beak and rudimentary spurs. The cat was so completely taken aback by a stand as unexpected as it was bold that time was gained for the writer to come from a distance of several hundred feet, and to rescue the little champion.

According to the well-established rule that a grade of a pure-bred animal or fowl upon a mongrel will retain more than a due proportion of the qualities which are firmly fixed in the pure-bred stock, crosses of Games on common stock may be expected with confidence to produce active fowls of medium weight and good constitution, well shaped and of good quality for table poultry, and very good as egg-producers.

Westchester Co., N. Y.

HEN MANURE.

SEVERAL careful analyses of pure hen manure give of the three most important plant food elements:

Phosphoric acid	2.48 per cent.
Potash	2.05 " "
Nitrogen as Am. and organic matter	3.35 " "

As is well known, the manure of birds is valuable from the fact that it contains the urates and other highly nitrogenous substances which in other animals pass away in the urine. If the urine of animals could be secured in combination with the solid excrement, the value of the product would be greatly increased. It is claimed by some writers that hen manure is as valuable, weight for weight, as Peruvian guano. This is a mistake, as analysis of guano shows a far higher percentage of nitrogen and phosphoric acid. This is doubtless due, to a great extent, to the fact that much nitrogen is allowed, by careless handling and storage, to escape from the hen manure. Then, again, the Peruvian guano is obtained from birds which have an almost exclusive diet of fish and meat. It is beyond dispute that the value of manure depends upon the food from which it was produced. But hen manure is far superior to ordinary barnyard manure, as will be seen from the following table giving the number of pounds of the three most valuable elements in a ton of hen manure and a ton of well rotted barn manure.

	Barn Manure.	*Hen Manure.*
Phosphoric acid	6	48.60
Potash	10	41.00
Nitrogen	11	67.00

Thus 400 pounds of pure hen manure would contain very nearly as much potash, phosphoric acid and nitrogen as are contained in a ton of common barnyard manure. We believe that hen manure, properly saved, will prove cheaper, when used upon quick-growing crops, than any fertilizer that the farmer can save or buy. With melons and garden vegetables we have obtained the best of results from hen manure. Its effects upon corn are well known; in fact, in the regions where manure will be most likely to be saved, the corn crop will be almost sure to receive the benefit of its strength. We do not find it to be the most economical manure to use on potatoes; a fertilizer richer in potash will give better results. There is considerable discussion among farmers as to the best methods of preserving hen manure. The best poultry men to-day seem agreed upon the fact that it is most profitable to keep fowls upon low roosts with a shelf below to catch the droppings. With this arrangement the process of gathering the manure is much simplified. The shelves may be scraped off every few days into boxes or barrels, and the manure dropped upon the floor may be scraped up in the same way. It will pay to keep the shelves and floor well sprinkled with dry muck or sand. This will reduce the strength of the manure and keep it in better condition. Wood ashes should never be mixed with hen manure, as the combination will liberate the nitrogen. Where it is desired to apply them together it is safer to put the manure in the hill or drill and to scatter the ashes broadcast. Plaster may be profitably mixed with hen manure. It will "fix" the ammonia securely. Many farmers obtain their most valuable fertilizer by mixing hen manure with plaster and fine bone flour. The manure is spread upon a floor and beaten finely with a shovel. One-fourth its bulk of plaster is sprinkled over it and the mixture raked over and into a heap, to be again spread out and raked up. With one-fifth its bulk of fine bone flour mixed into the mass in the same way, a fertilizer can be obtained stronger than the ordinary superphosphate. Where poultry are confined in orchards or in various parts of the different fields the manure is evenly and cheaply distributed, to the great advantage of the soil.

FEEDING TROUGH FOR HENS.

MR. J. V. H. NOTT, of Ulster Co., N. Y., is greatly pleased with his feeding trough made like that shown at Fig. 234. It is easily made,

Fig. 234.

and will keep the food perfectly clean, this latter item being of vital importance in preventing poultry diseases. It saves the feed, and when filled at night, enables the hens to get their breakfast as early as they choose instead of starving for two or three hours, as is usual. The trough is made of 10-inch boards, six feet long, with sides five-inches high or wide, and with a space of four inches between the sides and the cover, allowing a row of hens on each side to feed at the same time, say 30 in all. The cover is made to drop between the end pieces, with a large nail or wire driven in near the edge for hinges (shown at the dot in the illustration), and with ear-pieces at the front edge to hold the cover in place.

FIELD MICE AND EVERGREENS.—I have recently cut out dozens of Austrian, Scotch, White and Cembra Pines, but more especially Austrians, that were killed by mice girdling them in Winter. These trees, used in shelter-belts, have been kept low-headed and densely bunched to the ground, so that a lot of dry leaves is sure to collect under their branches and around their stems. These give shelter to the mice in Winter, and field mice always repay any consideration shown them in that respect by cutting every green thing within their reach.

* * *

AZALEA AMŒNA.—We have a large azalea bed which on one side is bordered for 75 yards by Azalea amœna, of which there are 125 plants, and all of them are now in full bloom. It is a splendid show. The plants are hardy enough here, evergreen, and grow well and bloom lavishly every year.

* * *

DECIDUOUS AZALEAS.—Our azalea bed contains 2,500 plants, and is a solid bank ranging from 18 inches high at front to five feet high at back. Some of these now are in full bloom, and others will keep coming in in succession till the middle of June. They vary in color from white and yellow to flame and dark crimson. Every little sprig will bloom. Among them we have many A. mollis, but I think it is a little more tender than the average Ghent Azalea.

* * *

TREATMENT OF HARDY AZALEAS.—They love cool, moist ground, such as Rhododendrons delight in, and shelter from Winter winds. Ours, in an open place of minimum winter temperature of six degrees below zero, thrive very well. We mulch the whole bed heavily with tree leaves so as to preserve the ground cool and moist in Summer. We never dig or disturb the soil in the bed. We apply the mulching about the end of March, and renew it every year. Before Winter the mulching will have rotted down so much as not to afford shelter for mice; and it is to avoid the mice-plague that we do not mulch in Fall in preference to Spring.

* * *

DAPHNE CNEORUM is a trailing, little evergreen shrub with pink blossoms. It is now in full bloom, and it will blossom a little during the summer months, and yield a fairly good crop again in Fall. It loves a cool, moist nook deep in fairly good soil, and shade from bright sunshine, especially in Winter. It is hardy enough. We had a mass of it on a sunny slope in sandy land, but it was unhappy, so I lifted and tore it up into as many little bits as I could get with roots to them, and planted them in deep, moist ground, and now I have hundreds of plants all pink with blossoms.

* * *

DAPHNE GENKWA is now at its best. Its flowers are violet-blue, fragrant, produced all over its naked, twiggy shoots, and distinct in color from the blossoms of any other seasonable shrubs. Our plants are nearly three-feet across, very branchy, but hug the ground too closely to show themselves off to good advantage. I think if it were like the dwarf cherry, raised standard fashion, its looks would be much improved. It is slow-growing, but with us at any rate, appears perfectly hardy. Our plants are growing on an open sunny slope, in dry sandy ground that is kept mulched.

* * *

PTEROSTYRAX HISPIDUM.—We have two trees of equal size and some five or six years old. Had I allowed them to grow up at will, they would be ten feet high or more, but I believe in trimming a tree while it is young, so have made them into well branched six-foot specimens. One of them is now coming into bloom. It has racimes of creamy white, fragrant blossoms. Its leaves are large, downy, showy, and remain in good condition, and unmolested by insects all Summer long. Its outer bark comes off in shreds. Growing under ordinary circumstances it seems quite hardy. This Japanese tree will, I think, be a good addition to our list of decorative trees.

Long Island, N. Y. WM. FALCONER.

RURAL LIFE NOTES.

TYSON PEAR.—I am sorry to see in the RURAL the advice against planting the Tyson Pear. Mr. Parnell discourages its growth on account of its tardiness in bearing. I have no complaint to make regarding the Tyson in this respect. Having grown it both as a standard and dwarf for over 20 years, it has in every case fruited promptly and abundantly during all that time. It is too good to go without even were it a little shy in bearing. But as a matter of fact, it often fruits too heavily with me, at the expense of wood growth and size of fruit. Worked on large stocks, it will bear the second year. It is a fine table pear, both in flavor and appearance, and an especial favorite with ladies who are apt to be fond of things "so sweet, you know." It must, however, be eaten as soon as ripe; the flavor cannot be held in suspense for anybody The quality is rated best in the American Pomological Society's Catalogue, and it has won many stars there. A hedge on the farm of Jonathan Tyson near Philadelphia, was the birth-place of the Tyson. Don't let us give it up. That it was not named "Jonathan Tyson's Seedling" is an escape worthy of record.

SHORTEN THE NAMES.—Mr. Engle's defence in a late RURAL of the progressive changes made in the last two catalogues of the Am. Pom. Society respecting the shortening of names of fruits was timely. That such an intelligent pomologist and gardener as Mr. Hovey, who has for so many years been a guide in the gardens and orchards of America, and who has achieved so much in behalf of the horticultural world, should now be disturbed into opposing the honest progressive efforts of our best and most intelligent pomologists and fruit men, is a matter of surprise and regret. Surely one name is enough for almost any fruit, and even that is too much in hundreds of cases that might be cited. Let the ax of the "Nomenclateurs" continue falling until all the prefixes, affixes, descriptive adjuncts, and useless French encumbrances are lopped off. President Wilder is eminently right, and I believe nine-tenths of the fruit men are with him.

SNOWFLAKE POTATO.—Among all the potato notes and literature which the RURAL has so generously and carefully presented to its readers very little has been said of the Snowflake. In my estimation it stands at the head of all potatoes yet produced for quality. Not one on the entire list of new and old sorts that I have tried quite equals it on the table. Smooth and handsome in appearance, keeping firm and fresh till Summer, eyes scarcely indented at all, cooking dry, and beautiful at all times, and having a peculiar nutty flavor, it is difficult to suggest an improvement for a table potato. Some have found it less productive than a few of the newer varieties. With me it has exceeded the yield of any sort I ever grew. My first pound of seed, costing $1, gave me 150 pounds of the finest potatoes I ever saw, in every respect, without any special forcing to obtain a fancy yield. I have been entirely satisfied with the Snowflake ever since. [We tested the Snowflake when first in-

troduced. It does not yield well with us.—EDS.]

I SEE that Ellwanger & Barry have been kindly reminding their patrons and novices in fruit culture that peach trees always bear their fruit upon wood of last season's growth. Now that is in fact the old accepted notion and belief. But here along the Hudson River we have about lost faith in the doctrine. For two years in succession we have had no peaches on wood of any sort, and now the trees are dying in large numbers, and some of the impatient growers are beginning to doubt whether peach trees are likely to produce fruit even upon wood of future growth. Can it be that our modern peach buds are more sensitive than their ancestors, or are they subject to greater trials?

How many RURAL readers have planted seeds of the Chinese Primrose? Seeds sown now in pots, placed in a gentle hot-bed make fine plants, which will come into bloom in November or December, and remain in full flower all Winter and Spring. Nothing is more charming in a sunny window. The plants themselves, as they develop from the seed during the Summer, are beautiful and interesting in their wild-wood freshness. They should be protected from the direct rays of the sun and kept cool. Water sparingly at first, and keep the pots in a frame on the north side of a wall, or other similar protection, until ready to bring in for flowering. Get the very best seed. I already have a fine lot of little plants just showing the third leaf from imported seed—choicest strains. Beautiful double flowers are often obtained in this way.

MINNEWASKA BLACKBERRY.—This new blackberry, not yet disseminated, I believe, has again emerged from the Winter alive to the tips, here in the Hudson River Valley. This feature of hardiness has long been the pressing need of blackberry growers at the North. If with the exceptional productiveness, good size and quality so far evinced by the Minnewaska it shall continue to combine iron-clad vigor, it will be a valuable acquisition. H. H.

Kingston-on-the-Hudson.

Farm Topics.

FARM NOTES.

TOO MANY COCKS.—I have been examining the poultry on some of the farms about me. On one I found one rooster to every five hens, and on another one to every four hens. The average seems to be about one rooster to every seven hens. What the extra roosters are for is a question. They are of all sizes and ages; they are constantly fighting and chasing the hens about, and are of no use whatever. There are too many roosters on every farm. At least 50 per cent. of them could very profitably be killed off.

GARLIC FLAVOR IN MILK.—Many dairy cows are giving "oniony" milk. This comes from eating the wild garlic which is too frequently found in our pastures. The taste is worse at night, and passes away somewhat as the milk cools. The butter appears to be slightly affected. Cows seem to prefer the weed while it is young and tender; as it grows older and tough they care less for it. This suggests one means of shortening its power to do damage. Keep the cattle out of the pastures until the grass has a better growth. The garlic is hard to eradicate when once it gets a footing in the pasture. Sheep nibble it down but will not wholly drive it out. It can be killed only as other weeds are destroyed—by hand digging, or by using the ground for hoed crops and practicing clean culture. This plan is impracticable in many places, as pastures are hired or of such poor soil that no decent hoed crop could be raised without all the manure that is produced on the farm.

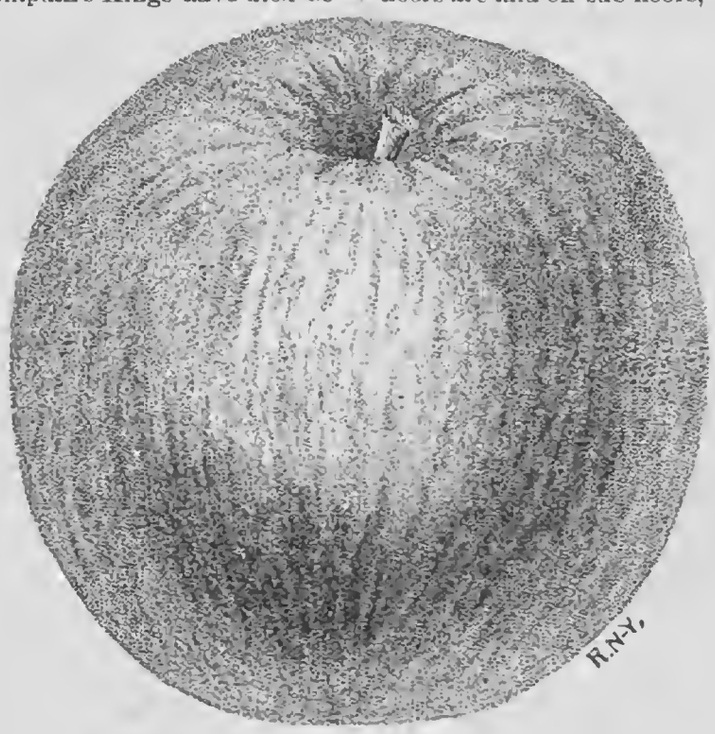
NEED OF WEEDING JERSEYS.—Let a poor Jersey bull go into a neighborhood, and he will spoil the reputation of his breed for ever. There are Jerseys and Jerseys, but common farmers will not understand it yet. Some families of Jerseys are but little better than scrubs for milk or butter. Every time a bull of one of these families is sold, the breed is injured. A farmer near me paid $20 for a Jersey grade calf which, at three years old, is hardly able to pay for her keeping. She was bought simply because she was a "Jersey." Her owner will now do his best to convince all hearers that "Jerseys" are good for nothing. The Jersey breed will never be able to reach its proper place until breeders muster up courage enough to conduct a systematic killing of all poor bull calves.

CLEAN OUT THE REFUSE.—Many lofts and sheds have not been cleaned out this Spring. The refuse of the hay, straw, or corn-stalks still covers the floor. Hens, pigeons, and other farm stock are allowed to run over this covering. They should all be cleaned out, and the contents placed in the manure pile. Most of it is too filthy for bedding. WORKMAN.

Pomological.

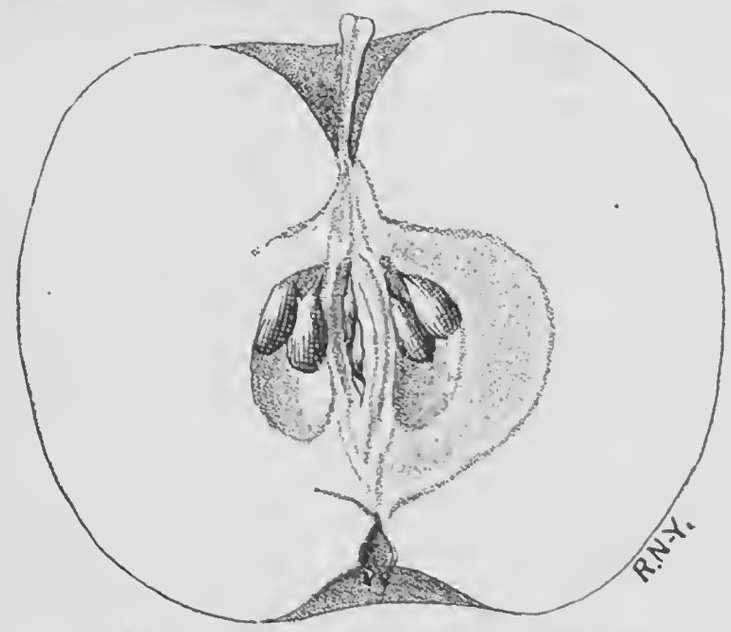
THE LICKLY APPLE.

LAST October we received specimens of the apple shown at Figs. 230 and 231, from J. D. Lickly, Jefferson, Michigan. He has in his orchard seven trees of the sort, planted 23 years ago, which came originally from Orleans County, N. Y., having been grafted before they were sent to Michigan. The trees are as vigorous as any in his neighborhood, and more so than most. They resemble the Baldwin in upright growth, but are much hardier and healthier. Not one of the sort has died since they were set out, though Northern Spys, Baldwins and Tompkin's Kings have died beside them. They bear annually, with very few exceptions; but they bear more fruit some years than others. They are the heaviest bearers in his orchard. Insects do not seem to injure them. The fruit is famous for its excellence in that neighborhood, being less gnarly and wormy than any other sort. It ripens and keeps like the Northern Spy, and is considered an excellent dessert and fair cooking apple.



LICKLY APPLE. From Nature. Fig. 230.

As received, it was conical and long, and a little irregular. Stem short (¾ inch), slender, planted in a small regular cavity, the inside of which was covered with russet. Calyx large, open segments, erect, situated in a shallow, slightly corrugated basin. Color, ground, a russety yellow-greenish about the calyx, and the whole apple nearly covered with a bright-red, thickly streaked with dark-maroon red stripes, somewhat irregular, with many small, gray dots. Core small and sparsely filled with small, plump seeds. Flesh firm, fine-grained, juicy, mild sub-acid and very pleasant. Color of flesh white, slightly tinged with a creamy hue. Skin very solid and hard. Quality very good, spicy and pleasant. A handsome and good dessert apple.



LICKLY APPLE. Cross Section. Fig. 231.

Architecture.

A COMFORTABLE RESIDENCE.

THROUGH the kindness of Mr. W. C. Goodrich, of West Troy, N. Y., we are enabled to show our readers the exceedingly well arranged house illustrated at Figs. 235–6–7, p. 353. It was designed by Mr. Clarence B. Cutler, of Troy, N. Y., and is to our mind a very ideal of comfort and convenience. It cost, in round figures, $5,000. It stands in an exposed position, consequently much heavier timber is required than would be needed in a more sheltered place. The cellar wall was made two feet thick, as the stone could be had in any quantity for the hauling. The outside walls are formed of 2x6-inch studding, lath and plastered inside and covered on outside with spruce flooring matched, then two thicknesses of heavy paper, and six-inch siding. The outside is fitted with three coats of white paint. The inside wood-work is rubbed smooth and polished. The kitchen and pantry wood-work is oiled and varnished. The roof is covered with shingles double-coated with Cabot's creosote wood stain. The flooring in the kitchen and pantry is of Georgia pine smoothed and oiled; in the dining-room, office, and hall, it is of maple, polished and oiled; and in the sitting-room and parlor, of clear white spruce. All the floors are laid on sub-floors, with two thicknesses of heavy paper between. The partition studding is all braced, and the flooring timbers are all bridged every eight feet. Ventilating flues run from the floor of every room to the peak of the house, up near the heater flues. These latter flues warm the air and thus keep up a perfect circulation, and the air in every room is kept pure. A tank is placed in the attic, and a force pump is in use on the kitchen sink. Water is warmed by the kitchen stove, in a boiler, for the bath-room and kitchen purposes. This well built house surely comes very near to the ideal family residence. It is strong, attractive, convenient and comfortable. From illustrations of this kind intending builders may obtain many useful suggestions without following exactly the plans described.

Rural Topics.

Experiment Grounds of the Rural New-Yorker.

MIKADO AND TURNER'S HYBRID THE SAME.—During the present season two new tomatoes were placed before the public as the Mikado and Turner's Hybrid—the first by Peter Henderson & Co.; the second by W. Atlee Burpee & Co. Both firms speak of it as entirely distinct, enormously productive of extra large, solid fruit, which is unequaled in flavor. We ordered seeds of each and sowed them. The plants are now two feet high. The leaves are distinct from all other tomatoes we have ever seen, but it is impossible to distinguish the Mikados from the Turner's Hybrid. Mr. Henderson, in reply to our question, says that the variety was obtained from a man near Jersey City. Mr. Burpee obtained his seeds from a man named Turner, whose address is lost. Certain peculiarities of the stems, color and hairs of the leaves, as well as their odd entire shape, lead to the inference that the Mikado and Turner's Hybrid are one and the same, though evidently coming from two different sources. The true origin of this variety is a matter of interest in the future improvement of the tomato, as it is plainly a decided departure from those in cultivation.

EARLY ASPARAGUS.—Our neighbor, Mr. W. Williams covers his asparagus bed before the severe frosts of early Winter with six inches of manure. In the Spring it is removed. The shoots are then found to be pushing from the protection they have thus received, and he secures asparagus a week or so earlier than others who raise it in the usual way.

CATALPA SPECIOSA.—This, as we have remarked, is growing near the house on the north side, securing only the early morning and late afternoon sun. The Common Catalpa enjoys a full southern exposure. Nevertheless, the Western or Hardy Catalpa, as it is called (C. speciosa), broke bud about one week before the other. We have never had the least doubt as to the distinctness of these two trees since we have had the opportunity of comparing them, and we dare say that doubts exist only in the minds of those who have taken but little pains to inform themselves.

Miscellaneous.

PITHS FROM SUBSCRIBERS.

Too many farmers kill their calves or sell them for a song. My best cows are the ones I have raised. I want to know the record of a calf's mother, grandmother and great-grandmother. I don't want to read this record in a book, but to milk it out with my own hands. My calves never know what it is to suck the cow. I feed them on new milk for three weeks and then gradually "taper off" to skim-milk. Oats or bran are the best grain food. I won't let a calf run out to be tortured by flies. Common bread soaked in water and boiled into a gruel, makes a fine calf food. I always castrate my bull calves before they are 10 days old. I would never let a young calf that I cared much for stay out in the dew, rain or wet. I breed my heifers as young as they will stand. I prefer to do this and then let them rest after their first calf. It pays to make cows out of them as soon as you can. Feed them well and there will be no lack of vigor. Dairymen are too stingy with their sweet milk. They won't put a few quarts of it into a good calf. That is where they make a big mistake. DAIRYMAN.

Steuben Co., N. Y.

MY mortgage is off. I believe the tile drains I have put in helped carry part of it away. Most people here have failed with Delaware, Brighton, Lady Washington and Duchess Grapes, while mine, over tile, have done extra well and pay better than common sorts. Onions, asparagus and rhubarb are all from seed, and are successful—thanks to the underdrains. Putting money out at drainage is like putting it into the bank. J. K. P.

Knoxville, Tenn.

I SAW in the RURAL, last year, an account of an experiment made with "floats"—finely ground South Carolina rock. It started me into a little experiment. I got a bag and put it on my wheat. I took one strip through the field and I can pick it out now without any trouble. It may not be the "floats," but something has done the business for it.

Orange Co., N. Y. H. M. C. G.

WE get a "fancy" price for our poultry and eggs; that is, we get just twice as much as farmers do who send their produce to the commission men. A lady who boarded with us one Summer liked our eggs and chickens so well that she asked us to send her some after she went back to the city. We did so, and she gave us lots of free advertising; that is, she told her friends about the pure, fresh, country eggs she was getting. The result was that her friends wanted some too, and this list of customers has grown until we have all we can do to supply orders. I suppose most "fancy markets" are started in about this way. There are always people who want the best and are ready to pay well for it. The trouble is to gain the confidence of such people and make them believe that you are honest and careful. It costs much time and patience to gain such customers, but it is a paying business. J. H. G.

Queens Co., L. I.

THE Wire-Grass region of Georgia and the Carolinas is recommended as a sheep country. These localities are better for sheep raising

than most of the Northern States, where the bulk of the sheep in the country are found. Florida is better still for the business. True, few sheep are as yet kept in the State, and these just grow up without being "raised:" but numerous small flocks attest the fact that the climate and feed are well adapted to sheep and that with proper care they will do well. In this part of the State there is considerable rolling, hilly ground, which is well covered with the different varieties of native grasses. Bermuda and St. Augustine Grasses are easily set out and have rare "staying qualities." The Bermuda is the best pasture grass in the South. The vast numbers of worthless dogs that roam about here hurt the sheep business more than anything else. There are also a few wild cats left. Bears and wolves have mostly been driven away. The Southern people don't pet their stock enough to have them do well—except the saddle or carriage horses. One reason for this comes out in the story told of the Texas man who entered a hog at the St. Louis fair. They asked him what ring he wanted to enter and he replied the speed ring. As it was not usual to expect speed in a hog, the secretary asked for an explanation. Texas thought they did not understand how matters stood at his home. Down where he lived a hog that could not outrun a darkie was not worth a cent. This may be why so many of our cows, sheep and hogs are trained for speed. J. M. M.

Clay Co., Fla.

I HAVE never been satisfied that there is such a gain for small farmers in using corn planters. I always plant my corn in the good old way—with a hoe. I know then just how it is put in, and I find I have less replanting to do. It pays to "make haste slowly" in these times. J. H. B.

Cass Co., Mich.

I HAD good luck at getting subscribers for the RURAL this year, and here is the secret of my success. Three years ago I bought a fine Holstein bull calf. This year I offered his services free for one cow to all who would subscribe for the RURAL. This has worked well in every way. Farmers were glad to take the chance and I got a good club at little expense to me. We shall improve the cattle about here and drive the scrubs out. H. B.

Saginaw Co., Mich.

I HAVE in my store window what I call a great curiosity. Last Summer I took up a tomato plant with some green tomatoes on it, put in a box and placed in the window. In October I picked 11 ripe tomatoes from it, in November three, in December three, in January one, in February two, in March 10, in April two, and now there are two ripe ones and over 20 green ones and lots of blossoms. I use a coal stove, and the fire never goes out in the Winter. I am now satisfied that it will keep on bearing just as long as I water and tend it. The seed was first put into the ground in April, 1885. My windows are also gay with petunias, snapdragons and verbenas. They have been in continual blossom ever since June, 1885.

Gallatin Co., Mont. B. P. VAN H.

WE have some fine Holland calves that were raised "under glass." Our "forcing pit" is a shed, the back half having a shingle roof under which is a row of pens for the calves. The front is of glass, under which is a hot-air flue, utilized to forward some of the more common spring flowers and, later, for young chickens. The calves are taken from their dams at one or two days old and put into this "forcing pit," where the sun bath seems to do them lots of good. We do not notice that calves treated in this way are less hardy in after years. Roses propagated in this pit years ago show no signs of constitutional weakness. Running a 300-egg incubator we found this pit a very convenient "brooder." The broilers sold well in New York, and the pullets commenced laying in August and kept on through the Winter with no tarred paper protection to their quarters. Our experience with plants and animals is that early "hardening off" is not the way to get best results. We never tried raising a good calf on the south side of the straw stack, and have observed that a check of one week in the first four of a calf's life is not made up at three months.

Stelton, N. J. G. W. THOMPSON & SON.

WESTERN visitors always wonder why we keep the Chester White hogs in this country. They say they never can make a white hog pay in the West, but want the Berkshires, Poland Chinas, and other blacks. They say the black soil makes white hogs sick and that anyway a white hog is not so hardy as a black. We have tried everything in this section and have fully decided that for our use the Chester White is by far the best. We have to make every ounce count in our farming, and if any other hog would pay us better, we would soon find it out. Feed is of the utmost importance with us. Milk for young hogs up to four months with a little corn now and then. Wheat middlings make a good feed where milk is not plentiful. Feed apples, potatoes or anything that would taste good to yourself. Hogs need a good grass pasture in Summer and plenty of hay in Winter. Feed them your best hay in racks. The Chester White needs good food while it is young, in order to put on a good frame. When this frame is large enough, corn and a little cottonseed meal will quickly put on the fat.

Charlotte, Vt. C. W. F.

THE RURAL states, in the Poultry Special, that 13 Leghorns eggs weighed 30 ounces, 13 Wyandottes eggs 24 ounces, while 7 Langshans eggs weighed one pound. I took 13 of my hens' eggs just as they came—the largest I had broken the day before to convince a friend that they were not double yelked—and the 13 weighed just 35 ounces, and one dozen weighed two pounds. Isn't this a little extra? My hens are of my own raising—common mixed stock, with most Light Brahma blood.

Moodus, Conn. A. E. W.

TREAT the hogs gently. Talk to them. Get a curry-comb and smooth their backs with it. This will make them quiet and they will thrive better for it. Never allow dogs near them on any account. Coal cinders or charcoal should always be kept near them. Cholera will never come where hogs are well cared for. If they get lousy rub them with coal oil. Meat of any kind is always good for hogs. It is best to boil it and mix it with their slop.

Woodson Co., Kans. MRS. E. N.

What Others Say.

EXPERIENCE WITH ENSILAGE.—A writer in the N. E. Farmer gives his three years' experience with the silo. The editor indorses him as one of the most careful observers and accurate experimenters in New England—one who is not led astray by excitement or influenced by prejudice. He has fed silage made from sweet corn fodder during the last three Winters. Most of the time when feeding silage he has used it as the entire fodder ration of the cows, giving to each one bushel night and morning, immediately after milking. Two bushels would weigh from 50 to 60 pounds. With this ration he gives from 9 to 12 pounds, per day, of a mixture of equal parts by weight of cotton-seed meal, bran and corn meal. He has never seen any injurious effects from feeding silage either to the cattle fed or to the dairy products. Most of the milk produced has been sold, and he has been told that it has given as good satisfaction as any milk. He has usually made enough butter to supply his family. His chief reason for so doing has been the difficulty of purchasing as good butter as he could make. No one has complained that his dairy products partake of the disagreeable odor or flavor of silage so often alluded to by some writers. He thinks when such taint is found it is caused by careless exposure of the cooled milk to the fumes of silage, which will always pervade the stable at feeding time, and to some extent at all times. He does not believe the taint is imparted along with the secretion of milk.

About the economy of feeding silage, though he believes it is a considerable saving in many cases, he is not as enthusiastic as many of the advocates of the silo of the Dr. Bailey order. He does not think he would construct a silo for preserving any other crop except corn fodder. Corn fodder is so coarse that it dries very slowly, and it is difficult to so cure it as to keep it in good condition. If it is dried sufficiently to keep when packed away in the barn, it will be found to contain so little of the saccharine matter abundant in its green state, that the taste cannot detect it. Just what becomes of the sweetness he does not know. Whatever the cause, it is a fact that cattle do not readily eat over-dry corn fodder. When packed away in a silo in the green state, such fodder will keep without drying, though it will take on a considerable degree of acidity. A part of the sugar will be changed into vinegar. Perhaps its food value is to some extent decreased by this change, but he thinks to a less degree than in the process of drying.

Though he has generally fed silage without other fodder except grain, he does not think that is the best way to get the largest returns from the cows. He thinks one feed per day of silage and one of dry fodder is quite as well. If good clover hay or rowen is used for one feed, the returns will be better than when silage alone is fed. When he changed from feeding silage to feeding good upland hay only, there was no increase in the flow of milk, the grain ration remaining unchanged. The cost of feed was largely increased.

He cuts the fodder about one inch in length, but thinks 1½ or two inches long would be as well. He thinks there is no necessity for hurrying when filling the silo, but it ought not to rest more than a day or two without adding a foot or two of freshly cut fodder to the surface until the silo is full. Then it should be covered and weighted 50 to 100 pounds to the square foot of surface. He uses loam or sand, believing it better than stones, as it excludes the air better. In constructing a silo he would recommend as great a depth as can be easily obtained without causing too much labor in filling and emptying. For feeding a herd of not more than 20 cows he would choose to have the silo 12 to 15 feet wide, and any length to get the room wanted. Then when using he would uncover at one end to expose about five square feet of surface for each cow being fed, and when that was used to the bottom he would uncover another strip.

His silo walls are in part cement and partly matched boards one inch thick. The silage is quite as well preserved next the wood as next the cement. Wooden walls are much cheaper for all that portion constructed above ground. It is very important that the walls should be of a true surface and perfectly plumb, and the perpendicular corners should be filled in about as much as would be done by using a 12-inch plank, beveling the edges to fit each side when the plank is set up endwise in the corner.

The cost of silage compared with other fodders will depend upon circumstances. To a farmer growing sweet corn for canning, he thinks the silo is a greater help than to most others. The ears are removed while yet the stalk is in its best condition to make fodder, either silage or dry. An acre of such corn will make from six to ten tons of silage, and three tons of such silage will equal in feeding value one ton of good hay. In such circumstances it will be readily seen that corn fodder silage will be found a cheaper feed than hay. When preserved in this way it retains its food value and palatability through the whole season. If the corn is grown for fodder only, the yield ought to average nearly 15 tons to the acre, and be more valuable ton for ton, when the ears have been removed, if both are weighed when containing an equal proportion of moisture.

The average cost per ton of curing silage will be not far from $1.00. If the fields are convenient to the barn and large quantities are handled, it may not cost so much; and if only small quantities are put in, it will probably exceed that sum. There has been considerable written about the comparative advantage of putting the fodder into the silo whole and cutting it before packing. The first season he thinks he hired it cut; the second season not finding it convenient to cut it, he packed the whole, laying it as straight as practicable. Last season he cut it again. He thinks it keeps about equally well either way, but the silo will hold about one-quarter more when cut. When packed uncut it was considerable work of a hard and disagreeable kind to take it out for feeding; and though the cows rejected very little they did not eat it wholly, as they do when cut.

REMEDY FOR APPLE BARK LICE.—Prof A. J. Cook says soft soap, or a strong solution of the same, will surely vanquish the apple tree bark or scale louse if it is applied in early June and again three weeks later. To apply this specific he knows of no better way than to use a cloth and scrub by hand. To be sure we can, if dainty, use a brush like a shoe-brush, but he likes to go at it with a good cloth, when, with sleeves rolled up, he makes pretty sure that no louse escapes.

For the past few weeks he has changed the substance by adding crude carbolic acid, which he thinks improves it, especially if but one application is to be made; and we know that at this busy season the second application is apt to be neglected.

He heats to the boiling point one quart of soft-soap to two gallons of water, and while still hot thoroughly stirs in one pint of crude carbolic acid. This may be applied as before. This carbolic acid mixture retains its virtue, he thinks, longer than does the soap alone, and so it is especially desirable when but one application is to be made as described above.

Like the arsenites, so the carbolic acid and soap mixture is of triple value. Not only does it kill the dreaded lice, but it also keeps off the dreaded borers, which are also serious pests in the orchards.

PITHS AND SUGGESTIONS.

THE ash of corn cobs, according to the late report of the Mass. Ag. Ex. Station, contains, in round numbers, two per cent. of lime, five per cent of magnesia, 60 of potassium, and nine of phosphoric acid. But various kinds differed notably in composition. The phosphoric acid varied from 10 to five per cent; the potash from 65 to 60, etc.

The Top-over Corn consisted of 83 per cent. of kernels and only 17 of cob. The average length of ear was nine inches and the weight 6.8 ounces.

T. B. TERRY finds his horse manure in the best shape this Spring that he has ever known it to be in. The stables were never cleaned out all Winter long. The horses were wintered in warm pens or sheds, allowing about 200 square feet to each horse. One gentle pair were put together while the others were put into separate places. There being little work for the horses, they were wintered on hay alone. Straw was thrown freely in whenever it was needed to keep the surface dry and clean, and the manure was kept leveled down. The horses look better now than they would if they had been kept standing in a stall all Winter. The work in caring for them was reduced to the lowest limit. The floor was tight and thus all the liquid manure was saved with the rest. The manure did not heat at all, it was kept solidly packed by the feet of the horses and retained its moisture. It was spread with the manure spreader in good shape.

Mr. TERRY says the manure spreader is more injured than any other tool by getting wet. It should be put in the barn every night, and before it rains, and kept well oiled. When rightly treated it is a most useful tool, because it saves labor, and puts on the manure in much better shape than hand work can ever handle it.

PUCK is of the opinion that the friends of the working-man are making it somewhat hard for the working-man to live now-a-days. They are holding a high revel, and the working-man is paying for it; they have taught him the use of the brutal, unreasonable, un-American boycott, which will send hundreds of honest, misguided men to prison before it dies the death which is appointed for it.

THE men who pretend to be the working-man's friends are not so; neither are they the friends of anything but their own interests. Working-men have every right which is possessed by any law-abiding citizen of the United States. The President himself has not, as a citizen, one right that the working-man does not share.

OF COURSE, there are heartless money-grabbers, and monopolists who will impose on working-men whenever they get a chance. But they are as much the enemies of the rest of the public as they are of the so-called working man. They are enemies of society—just as thieves and murderers are enemies of society.

ED. CHEEVER of the N. E. Farmer says that the character of the Jersey cow has been sadly injured in public estimation by the course too often pursued by breeders in saving every calf that has a pedigree, regardless of other qualifications. It has come to be a common saying with some of our best breeders that more than one-half the Jerseys now in the country ought to have been sold for veal before they were six weeks old.

ACCORDING to the last report of the Mass. State Ag. Station, Kentucky tobacco stems ground contained 2½ per cent. of nitrogen and nearly nine per cent. of potassium oxide. They also contained 1.4 of magnesium, 3.7 of lime and nearly one per cent of phosphoric acid. Thus they are a valuable fertilizer. Their trade value is $15.50 per ton.

THE various kinds of roots usually raised on farms for feeding purposes, differ essentially in regard to the amount of dry vegetable matter they contain. Turnips contain from 7 to 8 per cent.; ordinary mangolds from 11 to 12 per cent.; improved varieties of beet roots, like Lane's, from 15 to 16 per cent.; good carrots from 15 to 16 per cent.; a good sugar beet from 18 to 20 per cent. of solids; or in other words, one ton of an improved variety of ordinary sugar beets is equal to from two to two-and-one-half tons of ordinary turnips, as far as the amount of dry vegetable matter is concerned.

THE Post says that the public are beginning to realize there is danger of the total destruction of small birds to satisfy the demands of an odious trade founded upon a worse than barbarous fashion.

THERE are lots of difference in hired men; the good ones are not paid enough, and the poor ones are paid too much, says a writer in the N. Y. Tribune.

O. S. BLISS says, in the same paper, that the summer eggs produced by careless and indifferent farmers in the remote country districts are gathered up and preserved to be pushed upon the winter markets at prices only a few cents below those of fresh eggs, often not nearly as much as the actual difference in value, allowing the old ones to be entirely sound, which they often are not. Well-in-

formed egg consumers know that in a great many cases two new, fresh-laid eggs are worth as much for their use as three preserved eggs which look quite as good in the shell.....

We are advised from time to time that many of our readers have purchased Japan Chestnuts, or the seeds, and planted them. We hope they will advise us from year to year how they grow and fruit.....

The Philadelphia Press comments upon the different quantities of seeds to be sown to the acre, which authorities recommend. Henderson & Crozier, for example, sow from three to four bushels of oats. The Rural people have raised oats of nearly every kind for 25 years, and our best crops have come from 1¼ bushel. Of course, the poorer the land the more seed is needed; and, again, some kinds of oats tiller more than others—the Champion, for instance.....

Once having eaten a Savoy, the ordinary cabbage, Mr. Stiles of the Weekly Press thinks, is coarse, flat and flavorless. Why should not the very best be always found on the home table of the farmer?.....

Mr. J. Hoopes, writing for the Press, says that fuchsias are among the best plants for beds in partial shade. To have them in perfection the plants must be of good size and well established in five or six-inch pots. After setting out in the open ground, the foliage must be syringed or sprinkled every evening except in rainy weather.....

Single petunias, Mr. Hoopes says, will give as much satisfaction for a small amount of care as any annual in the entire list. Get a good strain of seeds in the first place, and the plants will furnish a supply of seedlings thereafter without the trouble of sowing. As soon as the frost is out of the ground the young plants put in an appearance, and quickly begin to bloom, and keep on blooming constantly even after a few sharp frosts. The diversity of color and markings in a bed of mixed seedlings is really wonderful.....

Mr. H. is of the opinion that tuberous-rooted begonias give better satisfaction than any of the newer bedding plants. A slight shade during the middle of the day is beneficial, although they will grow and bloom in the sun. The double flowers appear to be as satisfactory as the single, although the former are not so floriferous. The tubers should be potted early in the season and set out without breaking the ball of earth.....

The Industrialist says that one has only to see the contents of an ordinary millinery store to know something of the extent of the bird traffic. But when we remember that there are many thousands of these stores in the entire country, and that all of them are similarly stocked, we shall see that the number of birds annually killed to supply them must count up into the millions.....

Supt. Thompson, in the same journal, says that the farmer who worries the least, and does more work than his neighbor with less trouble apparently, is the one who is never behind with his work. A farmer who is behind with his work is in a worse predicament than a business man of a city; for he deals more with Nature's laws—and Nature waits for no one.....

J. J. Thomas quotes, in the Country Gentleman, from an address delivered by David Thomas before the Buffalo Horticultural Society in 1848. Among other things the speaker said that no animal but man appears to enjoy the beauty of flowers. He never noticed any indication on the part of the lower animals that they were in the least affected by beauty. The love of flowers must then be considered as evidence of a higher organization, and those who cannot appreciate it, suffer for want of proper development and have claims upon our sympathy .....

Prof. Long, of England, says there are in every herd cows that are mere manure makers or pickpockets. They have the same feed that the rest get, and yet they will not give one-half the milk. The cows are in the herd, yet the trouble is to pick them out. They are generally frauds in the fact that they are the best-looking cows of all. They give a good mess of milk for a short time and then drop almost out. It pays to get rid of all such cows.....

Australian fruit arrives in England in excellent condition. It is packed in corkdust or sawdust, and placed in a cold compartment, where the temperature is kept as near to 40 degrees as possible.....

J. D. Goodwin brings to light, in the Sheep Breeder, a new enemy of sheep—the skunk. This odorous little animal attacked his flock and succeeded in killing two sheep. It caught them by the nose and held on with its sharp teeth in spite of the frantic efforts of the sheep to throw it off. The heads of the wounded sheep swelled badly, and they lived but a few days, thus strengthening the general belief that the bite of the skunk is to a certain degree poisonous.....

The Kansas Farmer strikes the last Missouri Legislature a well deserved blow when it speaks of the stinginess which compelled the printing of the last report of the Missouri State Board of Agriculture in the style in which it appeared. The great State of Missouri is disgraced by such legislators.....

The Pacific Rural Press looks upon Orchard Grass as the best all around grass it knows for a California climate. It does well under more diverse conditions than any other grass there. It keeps green through the dry Summer, but does not grow until the Fall rains. The only objection to it is that it is inclined to grow in bunches.....

A COMFORTABLE RESIDENCE. Fig. 235. (See page 351.)

Everywhere.

TRANSCONTINENTAL LETTERS.—L.

MARY WAGER-FISHER.

Sugar-beet culture in Washington Territory; a fine farm house; farm life and routine; anti-Chinese agitation; need of restrictions on immigration.

While visiting the farm of Mr. A., at the head of navigation on the White River, Washington Territory, as the mornings in the Fall are wet from heavy mist, which is not dissipated until toward noon, our rambles over the farm were usually in the afternoon. One day we went to look at the growing products in a newly cleared field—beets, cabbages, onions, carrots, etc., all of enormous size and the best quality. On a selected acre of ground 31 tons of sugar beets were raised. The average yield is from 20 to 24 tons. A factory for the manufacture of sugar from beets is contemplated—to be built this year by a stock company, at an estimated cost of $200,000 and consuming 200 tons a day. The yield of sugar is 10 per cent. Mr. A. sends his present crop of sugar beets to the Alvarado factory in California, at a contracted price of $4 per ton. He uses the German seed and sows in drills at the rate of six pounds to the acre. Mr. Ezra Meeker, who has a farm in this valley, is the leading spirit in the sugar beet factory. He is a large hop producer, and it was his hop farm in the Puyallup Valley that we wrote about last year. Mrs. A. told me that her husband was the first raiser of hops in the White River Valley, and that he sold his crop at Olympia for 75 cents a pound. But they had scruples in regard to hop culture which contributes ultimately to so much misery, and they abandoned that business altogether.

The farm is well stocked with fruit, and the apples were being picked and boxed, the boxes selling for 40 cents. No poultry is kept on the farm at the present time, as it is regarded as a "nuisance;" but the only daughter of the house, a young lady attending the university, had a plan on foot for establishing a poultry yard. The children have an enthusiastic love for the farm, and are full of schemes for beautifying and improving it. The farm house is new, and probably cost six or seven thousand dollars. It is finished throughout in fir, stained and varnished, and with beautiful hard-wood floors. It is of spacious dimensions, with modern improvements, and was largely planned by Mrs. A. and her daughter, particularly as to the kitchen, which has some novel features The library is stocked with good books, and the house has the further refinement of music. The education of the children is a very considerable expense, but is regarded as a very important one.

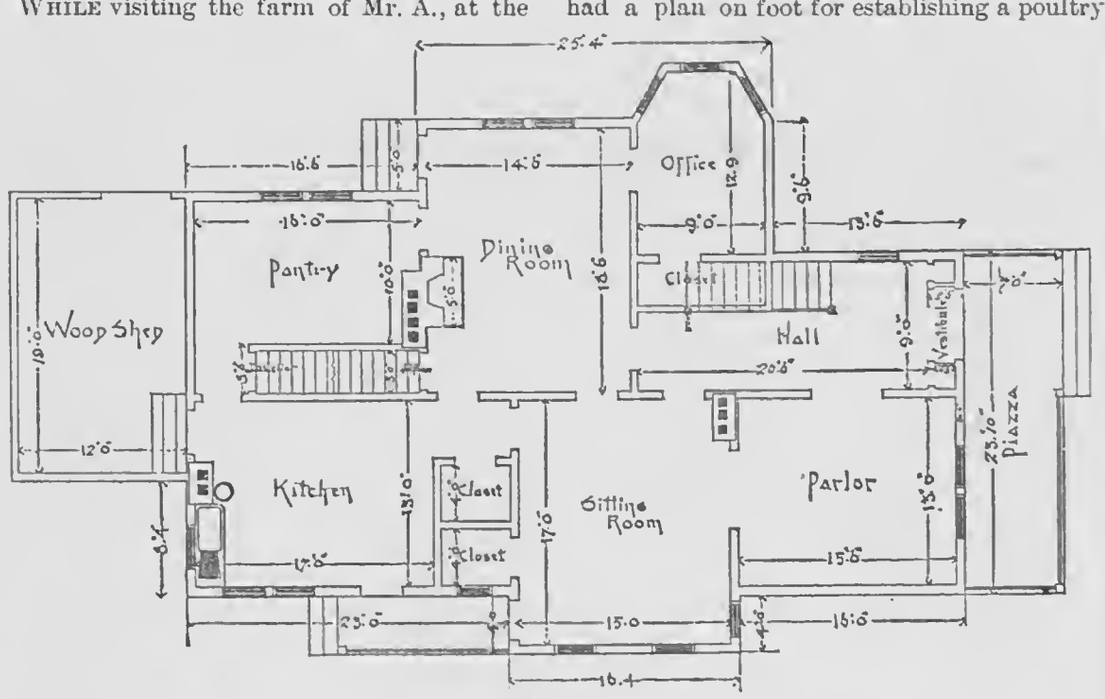


Fig. 236.

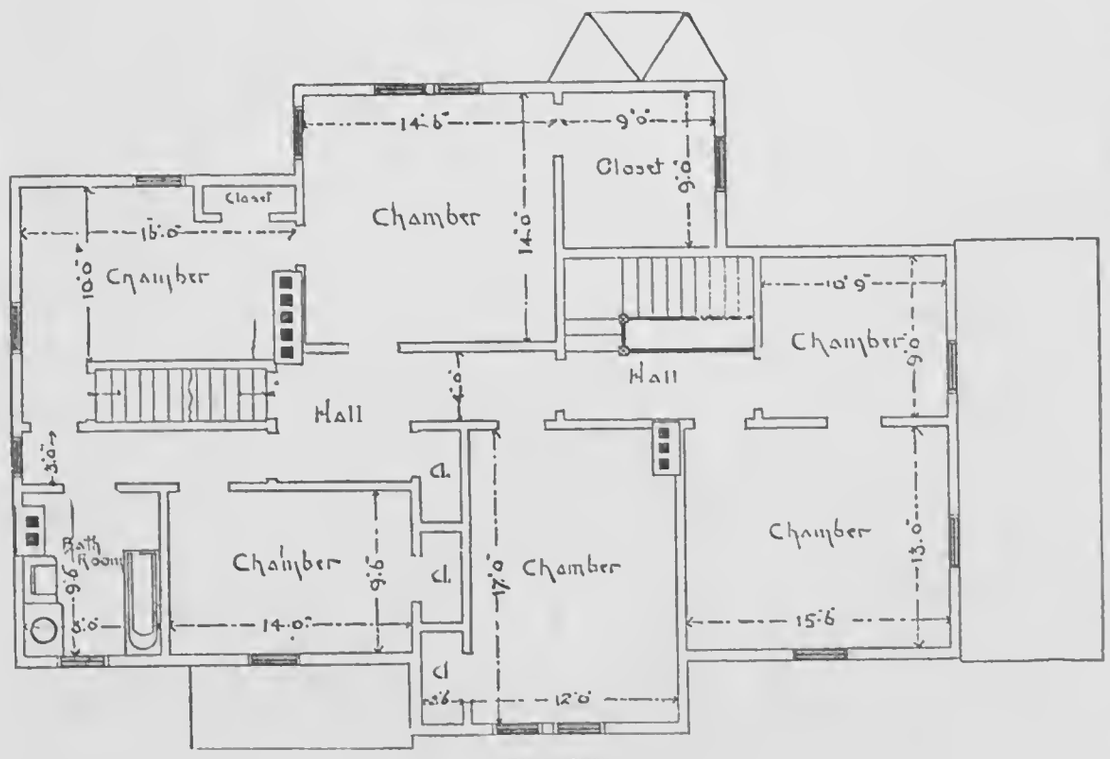

Fig. 237.

The library is stocked with good books, and the house has the further refinement of music. The education of the children is a very considerable expense, but is regarded as a very important one.

The inclination of pioneers, removed from the stimulating effects of social surroundings, to degenerate into slip-shod habits is so marked in many cases that I asked Mrs. A. how it happened that she had escaped a similar fate. She laughingly explained how it had come about, partly through the influence of a brother, who wrote her that he hoped, come what might, that she would always keep her "candle-sticks clean," and partly through her own "stuck-up-edness." She always argued that it was a mistake to lower one's-self to suit one's surroundings, but rather to stimulate others to self-elevation. During the early years she experienced the sore trials of isolation and the difficulty of getting help for the house, the only service available being the Indians, and she had taught Indian women how to work, to wash, and clean house. Of course on a farm where so large a force of men is to be fed for a part of the year, it is a matter of importance to have efficient house service. During the past year she has had a Chinaman for cook and general housework, with an assistant for washing dishes, etc., during the haying season; this cook also does the laundering, and has a salary of $30 a month. He is of superior skill as a cook, and very neat. Mrs. A. never knows what she is to have set before her at meal time, the cook making out his own bill-of-fare. She simply sees that there is no waste, and looks after the supplies. The table was invariably first-class—such cream as I never saw surpassed; only a few cows are at present kept, but a dairy is under contemplation in connection with the sugar-beet industry—and the meals were served promptly and with admirable order. The hired men ate with the family at a long table, but they appeared at table invariably with clean hands and faces and neatly brushed hair. During the Summer the original dwelling is used as a cook and dining house, so that the mansion house is free from the life of the kitchen; but in the Fall this building is required for the storage of apples, etc.

After the meadows are cut there follow several months of excellent pasturage, and large bands of cattle and sheep, which are brought from east of the mountains (Cascade), are pastured here for the Seattle meat market. The charge per month for sheep is 15 cents a head: for cattle from 80 cents to one dollar; for horses $1.50. I noticed, with genuine pleasure, that while the farming was first-class, the sanitary features of the farm house and adjacent buildings were carefully looked after, with convenient drains, and the appointments of the house, as well as its connection with outbuildings, so arranged as to facilitate work with the least fatigue. A piazza surrounds the house both on the lower and the upper floor, and from the tower on the top the outlook is magnificent, including an unobstructed view of Mount Ranier with the foothills, the mountain presenting a strikingly near and majestic appearance. One of the sons visited the mountain last Summer and shot during his short encampment there six mountain goats. Sunday is religiously observed at the farm, and neither Sunday-school nor church is neglected. It is hardly necessary to say that people of this class have not failed to win general appreciation and respect, and to be honored by all who know them; and no name in the Territory stands higher for integrity and trustworthiness than do theirs, which is no small thing on this coast, where high principles are not always held at par: and where, in order to "succeed," disreputable proceedings are often winked at. It must not be understood that success in farming here is to be achieved in any way but by hard work, frugality, and good management. The conditions here are different in several respects from those in the East, but the same qualities win success the world over. Mr. A. probably works harder than any of his hired men; but born with an equable, gentle, and kindly temper, he finds himself to-day with unbroken health and unworried countenance, and with nervous strength as fresh and tense as many a young man; while his wife is as trim in figure and as alert in step as a girl in her teens.

As this will be my last letter but one from Washington Territory, I wish to say that I hope nobody has been induced to come here "to settle" from anything I have written of the country. I have endeavored to be strictly honest, to tell the truth and to grind no axes, for I have none to grind. I like the country exceedingly, and in years to come the Puget Sound Basin will undoubtedly be one of the most magnificent portions of the United States. Its fine climate, the productiveness of the soil, and its great natural advantages and attractions are worthy of great praise. At this time there are no "booms," and if one

has money and a wish "to go West," it is a good time to buy property, which, however, is uot low, in the Eastern sense. Latterly there has been some disturbance on account of various so-called labor organizations combiniug to drive the Chinese out of the conutry, which effort has been attended in two or three instances with murder and destruction of Chinese property. As Eastern papers gave great publicity to these affairs, it was made to appear that the anti-Chinese element was composed of the best citizens, which is false. The anti-Chinese "congresses" and "conventions" were made up of "roughs," irresponsible persons and some misguided and foolish workingmen, who seem ever ready to listen to the babble of "leaders," who prate of being their friends, and who crave cheap notoriety. If the Restriction Act were enforced, there could be no good reasou for any outcry against the Chinese in this Territory, as the force is small and could be dispensed with only at the cost of great inconvenience. People employ them because their services are required. Iu Seattle the property owners and the leading citizens called a private meeting for adopting some method for the better protection of the city against the anti-Chinese rioters, as well as to prevent violation of law, and seven hundred of these private citizens were sworn as so many deputy sheriffs. Seattle is fortuuate in the temper and character of her people, and cau always be trusted to take care of herself. The people of Tacoma suffered the humiliation of having a mayor who was a "riug-leader" for the law-breakers.

I attended one of the anti-Chinese gatherings, and was uot surprised to hear one of the harauguers call men "miu" aud sentiments "sintiments;" he had evidently left "ould Irelaud" six months before, and had precisely the same right to the protection of this Government, and not a bit more than has a Chinaman, and is probably not half as desirable as a laborer. The Restriction Act should be enforced, and there should also be a restriction act for the Atlantic Coast as well, to modify the immigration from Great Britain and the rest of Europe. The happiest and most prosperous country is where the population is restricted to the supporting power of home industries, where the people do their own work, where there is no need for immigrants nor for emigration, and where the population is not made up of vagabonds from all quarters of the earth who fill the air with their spoutings of Socialism, Nihilism, Fenianism, Dynamite and "Whiteman's Government." If we could be protected by an immigration restriction act for 50 years to come, the United States might become Americanized and its population homogeneous in a general way. But under existing conditions there will be continuous ferment and trouble.

RURAL SPECIAL REPORTS.

Delaware.

DENVER, Kent Co., May 4th.—April was cool and dry, although we had but little frost. We have had so little raiu that small fruit that was set out this Spring will be a very poor stand. Corn planting commenced about April 24th; but most of the crop will be planted this week. Wheat looks fine, standing from 16 to 18 inches high. Clover and pasture fields look prosperous. Rye heading out. The peach crop prospect is better than anticipated; some sections will have a full crop, some half, and still others none. Apples, pears, cherries and quinces promise large crops. Small fruits look as if crops would be fair. Stock wintered well. Feed plenty, but few have yet turned out to pasture. Fresh fish plenty and brought to one's door for sale; herrings 75 cents a hundred; shad 18 to 25 cents apiece. The oyster season is over till Fall; still, oysters cau be bought yet. Times hard, and money scarce is the general cry, still nearly every one that wants it has work at fair wages. Farm hauds get from eight to $15 per month and board, and 50 and 75 cents a day and board. Mosquitoes have put in appearance to such an extent that screens are needed to keep them out of the house. Many Northern people are buying farms in this section, and good farms are selling for $50 to $80 per acre. S. T. S.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

RING-WORM ON A HORSE; HARD FROGS; WORMS; FEED FOR COSTIVENESS; WARTS; OIL-MEAL AS FEED.

W. E. J., Stapleton, N. Y.—1. Wheu I got my 10-year-old horse, three years ago, he had the heaves; and on his neck, a little below the ear, there was a bare spot under the maue. After brushing it got well, but reappeared larger in size, white and scaly. What is it, and what should be the treatmeut? 2. His frogs are hard, what should be done? 3. What is good for worms in a horse, and what are the symptoms? 4. What is a good food for a costive horse? 5. What will make him shed his hair? 6. What are large black warts on a yearling heifer? 7. How much new-process oil-meal is it safe to feed to a horse, and how much to a cow for butter-making?

ANSWERED BY F. L. KILBORNE.

1. Probably ring-worm. See Farmer's Club in RURAL of Jan. 30 last. 2. If very hard, they are too dry, and there is danger of contractiou of the feet, which may be followed by permanent lameuess. Allow the horse to run at pasture at night or in the morning, while the dew is on the grass, to wet his feet; standing for an hour or two daily in a very wet puddle of clay will auswer the same purpose. 3. Commou symptoms of worms in the horse are, general ill-health, rough coat, continual poor condition, although well fed and cared for, breaking of the hair about the root of the tail by rubbing against the back or sides of the stall; elevating the upper lip and rubbing it against the manger or wall, and mucus passed with the dung or collected and dried in a ragged ring around the anus; sometimes slight colic appears, especially before feeding, and frequently a cough. Various vermifuges are more or less successfully given. Oue of the most active and available is oil of turpentine, two to four ouuces diluted in oil or milk. The following is also very effectual: two drams of tartar emetic and one dram each of sulphate of irou and carbolic acid, to be given before feeding in the morning for six consecutive mornings, and on the seventh morning a dose of aloes. Also give an injection of several quarts of a strong solution of quassia to remove the worms in the rectum aud colou. In any case, five or six drams of aloes should be given 24 hours before giving the vermifuge to empty the bowels, that the medicine may be more effectual. Then, 24 hours after giving the medicine, give another dose of aloes to carry away the dead worms. Always allow free access to salt as a preventive. 4. Grass or other green food; oil or liuseed meal is also excelleut, one pint twice or thrice daily with the grain. If this is not sufficient, or green food is not available, give one ounce powdered gentian aud two drams each of aloes and niter twice daily until relieved. He probably does not chew his oats well; try ground feed. Read "Grain Ration and Cut Feed for Horse," iu F. C. of May 8. 5. Keepiug in good healthy condition and *thorough daily* grooming. Animals so kept will shed at the proper time. In the present case attend to the grooming and improve the condition as rapidly as possible. 6. They are probably warts or small tumors, judging from your description, and should be removed with the knife or with caustics. It is the grubs in the backs of cattle that are to be squeezed out. See articles on this subject in late numbers of the F. C. 7. It is *safe* to feed very much more than can be profitably fed; and the greatest amount that can be fed with profit will depend largely upon the nature and cost of the other articles of food, aud especially the grain ration. More can be fed with corn than with oats or wheat bran. A quart twice or thrice daily for either horse or cow is probably all that can usually be fed with profit. In ordinary cases one-half of this amount would be a fair allowance.

APPLE TREE SCALE LICE; CARBOLIC ACID AND SOAP MIXTURE.

H. S. C., Gaines, Tioga Co., Pa.—The insects uow found on the apple tree twigs are the apple tree scale lice. When so numerous as they are on the specimen you have sent us they are very harmful to the trees. They are amoug the most destructive insect pests of the apple tree. Under the scale will be found a great nuuber of minute eggs. These will hatch in June, when the young lice will attach themselves to the bark and engage in pumping out the sap. The remedy is to scrub the trunk and main branches of affected trees with soft soap, about June 10, and again the first of July, if you wish to be very thorough. The carbolic acid and soap mixture is still better, as one application goes farther. This is made as follows: Take two gallons of water and add one quart of soft soap, heat till the mixture boils; then add oue pint of crude carbolic acid, and mix till all unite permanently. To apply this to trunk and main branches, use a cloth or brush. If it is not kept from the foliage it should be still weaker, as the above strength would kill the leaves. If we mix one gallon of the above with two gallons of water, it will not harm the foliage. We prefer the strouger mixture, and apply it by scrubbing with a cloth, only to trunk and larger branches.

PRESERVING SEED CORN FROM BIRDS.

Subscriber.—It is probable that black-birds pull corn for the sake of the grain and not for the sake of doing mischief. In some localities they are very plentiful, and do great damage. They are not afraid of scare-crows or bells. An expensive method of preventing their depredations is to scatter corn in the field for them to eat. Early planted corn gets a good start and frequently gets too large for the birds to pull with ease, before the scamps come in large numbers. The usual arrangement of boy and shot gun, provides sport for the boy, but is costly and dangerous. When the corn is soaked in thick tar water and then rolled in plaster it becomes distasteful to the birds. Take ordinary gas tar in a cask, put in a small quantity of warm water and stir. Put in seed aud stir well up until every kernel is coated. Then drain in a basket and drop into plaster and plant.

ABOUT PRESERVING THE SCUPPERNONG.

J. G. S., Barnesville, Ga.—As a rule the Scuppernong, and also all the varieties of grapes of the Bullace type (Vitis rotundifolia), should uot be pruned, because the fruit is produced upon the old wood and there is liability of injury to vines from excessive bleeding which usually follows the cutting away of old wood. Should pruning be absolutely necessary to reduce the bulk of the vines, it is best to prune late in the Fall, after the fruit has matured and before the leaves have fallen. The most desirable plan is to train the vines when young by rubbing off the surplus young shoots in early Summer, and if properly trained upon arbors, pruniug will uot be necessary afterwards.

FAILURE OF POTATOES ON NEW LAND.—CHRONIC NASAL DISCHARGE IN A HORSE.

B. F. L., Reeve, Wis.—Though this is a new country, my neighbors tell me potatoes will not do well after the first crop, so all clear each year a new piece of land for this crop; what causes the failure, and how can it be prevented on land cleared only two or three years? 2. For a year one of my horses has nearly all the time been running from one nostril, and there is a bad odor; what's the matter?

ANS.—Reeve, Wisconsin, is in Langlade Co., and according to our geological report has a light clay loam soil, which should be favorable to the potato crop. All pioneers know that, with fair conditions, a "new breaking" piece will often produce the best crop of potatoes that can be grown on the farm, if the soil is not too "mucky." The soil of such land is loose from the large amount of decaying leaves and wood, and there is usually a large amount of ashes left on the soil from burniug the brush aud log heaps. Furthermore, the weeds of cultivation have not yet made their inroads, and so the potato plants have full benefit of soil and sun. These conditions, however, are not peculiar to any one section. It may be that the soil lacks potash or vegetable matter, humus, to keep it friable. To see if potash is lacking, spread ashes over the proposed potato ground. For the humus, try planting on land where clover is grown. We suspect, however, that the growth of weeds on the older cultivated lands has much to do with the unfavorable results. 2. The discharge may be due to any one of several causes, aud without knowing the particular cause we cannot prescribe definitely. The case is evidently not simple nasal gleet. From the long standing and odor of the discharge coming from one nostril only, glanders is expected. Examine the mucous membrane of the nose as high up as possible (place the horse in a stable, and elevate the head toward an open door or window) and compare it with that of a healthy horse. If yellowish or red elevations, pimples, erosions, or ulcers appear on the nasal membraue of the diseased animal, and the lymphatic glands on the inside of the lower jaw are enlarged, hard or nodular, and insensible, the case is undoubtedly glanders, and the animal should be shot at once, as dangerous to other animals and man. If no such lesions are found, have the horse examined by a competent veterinarian. This is always much safer and better than trying patent specifics of any kind. While they are sometimes good in general cases, they are useless in special cases, and frequently worse than nothing in any case.

LICE ON QUINCE TREES.

J. S. B., Hightstown, N. J.—Any one troubled with lice on his quince tree leaves can get rid of the pests if he will have the patience to apply the remedy. Get a cake of Buchan's carbolic soap (the black), pare off a couple of inches, put the parings in a tin or earthenware vessel and dissolve with hot water, which will convert them to a jelly. This jelly is readily reduced or liquified by cold water. For the quantity named above, four or five quarts of water may be used. The liquid is best applied with a syringe; or, in the absence of that, sprinkled with a brush or a small whisk broom, which, however, is tedious; or a tin pan may be used, in which case the foliage must be plunged iu the solution. The leaves must be thoroughly wet. The solution will not only kill the lice already on the leaves, but drying on the foliage, will prevent others from coming for a long time. If it should rain immediately after the application, it must be repeated. This is a cheap as well as a good remedy, and the only caution needed is not to use it too strong on young and tender growth.

Miscellaneous.

Mrs. A. B. C., Mountain Home, Pa.—When cows are fresh and the udders are very much distended, the milk frequently drops or leaks away. It is a common sight to see cows coming home from a good pasture with udders so full as to press a little milk away at each step. The most natural remedy is to relieve the udder by more frequent milkings. If this is possible, we would suggest it. If the trouble is due, as it may possibly be, to a weakening of the sphincter muscle of the teat or udder, it is not likely that any treatment will entirely remove it. A wooden plug is sometimes used to stop the leaking but never with complete success.

Fairmount, W. Va.—Will raspberries set this Fall do better than those set next Spring? 2. Will potatoes planted this Fall be earlier than those planted in Spring?

ANS.—1. We prefer to set raspberries, blackberries and currants in the Fall, and mulch or cover the soil about them with straw, manure or leaves. 2. Generally, yes. But there are serious objections to Fall planting—compaction of the soil, deep planting, etc.

J. W. S., La Favge, Wis.—Some of my sheep get so weak that they appear to have no use for their legs; there is a profuse discharge from the nose with occasional frothings at the mouth; they eat well, but finally die; what is the matter?

ANS.—We cannot say definitely. The difficulties may be due to exposure, lack of suitable food and drinking water or perhaps to parasites in the upper air-passages.

"*M.,*" *Davenport Center, N. Y.*—The very best thing a man who wants to start as a florist without knowing anything of the business, can do, is to learn the business by working for some good, experienced firm. We hope our inquirer will hold fast to his money until in this way he may be able to judge how to invest it. We should not buy a share in any business without any knowledge of that business.

G. C., Rosedale, Pa.—1. What would be the best crop on newly cleared, very rich land, sloping toward the northeast. 2. How can one tell when watermelons are ripe?

ANS.—1. Would suggest corn. 2. First, by the shriveling up and blackening of the tendril; second, by the sound when thumped. With a little experience one is rarely mistaken with these tests. The solid, dull sound is when the melon is ripe; the hollow sound is given whe nthe melon is not ripe.

W. C. H., Shrewsbury, Mass.—Boiled linseed oil may be applied to wagon wheels by means of the implement shown on page 103. This is an iron tank so shaped that the wheel can be revolved in it. The oil is heated to the boiling point, and then the wheel is turned in it. Where this implement is not at hand, place the wheel on a pole between two posts and apply the oil with a brush, turning the wheel and working the oil well into all cracks and joints.

J. H., Grant's Pass, Oregon.—No; pine sawdust is not "injurious to soil or plant," when decayed. We know of large quantities having been used in the South with good manurial effect. 2. No, we should never use sawdust as a mulch for strawberries. It is cold and heavy, excluding the air and harboring many insects.

J. T., Toronto, Canada.—1. Probably the best raspberries for your neighborhood would be the Doolittle, Franconia, Orange and Philadelphia. We have heard good accounts of Clarke, Caroline and Marlboro. 2. We are not able as yet to speak of the merits of J. T. Lovett's new yellow raspberry. Our plants have not fruited. It ought to be good for something, considering the advertisements.

T. N. W., Greenville, Texas.—Curl-leaf in the peach appears to be caused by climatic influences, such as very cold, windy weather. The leaves shrivel up and drop off, often after making a good growth in the earlier part of the season. We know of no remedy. The trees usually regain their vigor when the weather comes right again.

Several Subscribers.—The Ripe Fruit Carrier, mentioned at the last meeting of the Am. Pomological Society, is manufactured by Jenkins, McGuire and Co., Baltimore, Md. It seems well adapted to the distant transportation of choice, ripe berries.

A. B. E., Manhattan, Kans.—"To make a

success of celery raising" do not let the soil get dry. Do not let it bake. That's about it.

J. E. C., Bismarck, D. T.—From your description we cannot tell what ails the cow, and consequently cannot recommend any treatment.

C. A. T., West Cleveland, Ohio.—The Dorchester High-bush Blackberry will be hardy with you.

E. M. T., Susquehanna Co., Pa.—Prune the young arbor-vitæ hedge any time in September.

DISCUSSION.

BOGUS BUTTER AGAIN.

T. H. H., NEWPORT, VT.—The RURAL of May 15 says:—"We hear a great deal of the merits of the production from those interested in the manufacture of bogus butter. They claim that it is as healthy as the best butter and much more palatable than a large part of the 'rancid stuff' sold by grocers. Why, then, hasn't one of them come boldly into the market with this 'healthy, superior product' in its natural state, and sold it for what it is on its own merits?" Isn't it quite natural that the oleo and butterine makers should shield themselves as best they can from the whirlwind of defamation and falsehood which their product has encountered from the agricultural press? They lie, it is true, in calling their product butter; but, after all, it has to sell on its merits as an agreeable edible substance. I do not consider their crime so bad as that of those who have been trying to make the public believe that these goods are all made from diseased hogs, soap fat, and poisonous chemicals. This kind of falsehood has been dealt out by the newspapers generally (I do not include the RURAL) with utter recklessness as regards the real facts, and presumably because it is supposed to please the farmers. Yet it has done the farmers no good at all. The imitation butter continues to be made and sold, and will so continue, unless something better is offered at the same price. I talk with every dairyman I meet on the subject, for the purpose of hearing how they view it, and I am proud, as a farmer, of the intelligence and common sense of what they say about it. They just laugh at the rattle of the press, working to make itself solid with them as an ignorant mass of people, who are pleased to have lies told to injure a rival industry. No one knows better than our dairymen how much butter is put on the market that is utterly unfit to eat. There may be, as the RURAL asserts, "a multitude of little dark, filthy holes wherein all sorts of foul, rancid, deleterious fats from all kinds of animals are manipulated," (though proof of the statement has never come under my notice), but the product therefrom is quite equaled in nastiness by much genuine butter. The skilled dairymen of the country have no more sympathy with one than with the other. What they do ask, and all they ask, is that the factitious butters should be sold for what they are. This can be had by law, if no more is attempted. If more is attempted, we shall get nothing.

R. N. Y.—Judging by what they have done, there isn't a shadow of doubt that it is "quite natural that oleo and butterine makers should" "lie" "in calling their product butter;" but virtue consists in successfully resisting "natural" inclinations to evil; vice, in yielding to them, and there isn't a scintilla of doubt that every handler of bogus butter, from the wealthy manufacturer to the scrimping retailer, has yielded to the "quite natural" temptation to "lie," and has resolutely and persistently eschewed that noblest and most manly of virtues, truth. What a contemptible crew they must be, shielding "themselves as best they can" with the meanest and most despicable of all things, a "lie," from the "whirlwind of defamation and falsehood" set in motion by their own mendacity and dishonest dealings! Had they from the outset dealt honestly and truthfully with the public, what paper with the slightest pretention to integrity or decency would have assailed them with a "whirlwind of defamation and falsehood?" Which came first—the falsehood on their part or the "whirlwind" from the agricultural press? Didn't they yield to their "natural" inclination to "lie," before the press ever stigmatized their practices, or even knew much as to their nature or extent? There is no doubt that considerable abuse and misinformation have appeared in some agricultural papers with regard to the handlers of bogus butter as well as to its ingredients and the methods of manufacturing it; but who for a moment supposes that anything that appeared in those papers was the original reason why the dealers lied? How many of them ever read an agricultural paper? What agricultural paper has ever been as abusive of both dealers and goods as some of the political and comic papers—the N. Y. Times and Puck, for instance. The errors that have appeared in this connection in the agricultural press have seldom been primarily due to a desire "to make itself solid" with its patrons (though an honest desire to do so is, of course, always excusable); but to mistakes due in a great measure to the known fradulent misrepresentations of bogus butter manufacturers. They knew there was fraud in its sale; wasn't "it quite natural" that they should believe there was fraud in its manufacture? In this connection the RURAL needs no defence, for while it has always vigorously stigmatized the frandulent falsehoods of the dealers of bogus butter, it has never misrepresented the product; on the contrary it has several times published lengthy illustrated articles describing the nature of its ingredients and the process of manufacturing it.

That there is a great deal of filthy, unwholesome stuff made, however, we have no doubt whatever. About two years ago, before the passage of the law creating the Dairy Commission in this State, the writer visited two dirty cellars in the lower part of this city, where a number of nearly naked, frowzy men were sweating in making bogus butter, which was sold to retailers at 8½ to nine cents per pound; while the product of the large dealers was wholesaled at the time at about 13 to 14 cents. A lengthy exposure of these and some other similar places appeared in the New York World at the time. Fear of the anti-oleo law now in force closed them some time ago. We have no doubt, however, that a great deal of the stuff is still secretely turned out, for certainly much of that seen in grocery stores in poor neighborhoods is too streaked, dirty and malodorous to have been made by any of the large manufacturers, and what is true of the business in this place is sure to be equally true of it in others. During last year several of the Chicago papers made frightful exposures of the way diseased cattle, sheep and swine were slaughtered by unscrupulous local butchers and the pestiferous meat sold to the poor at low prices; is it likely the fat of these carcasses went to the public rendering tanks when it could be so profitably converted into "butter?" Armour & Co., are doubtless right in their boasts that the bogus butter they turn out in such vast quantities is cleaner and wholesomer than some of the genuine butter thrown on the market; but Armour & Co., are not the only makers of bogus butter in Chicago. Just as the temptation offered by great profits leads to illicit distilling, so it also leads to secret "oleo" making; but the poisonous product is made from wholesome materials in one case, and form pestiferous materials in the other. We have often expressed our fears editorially that by asking too much from Congressional and State legislation the dairy interests of the country would get too little, or nothing at all, and entirely agree with our highly esteemed correspondent in his view of the matter.

ABOUT THE BROWALLIA.

C. E. P., QUEENS, L. I.—In the R. N. Y. for May 1st, page 284, I notice an article on eight obscure annuals, by Mr. J. N. Dickie. Now, I do not desire to be critical, but I wish to take exception to his remarks when he advises us to take up Browallia plants that have blossomed all Summer in the open air, cut them back and pot for winter blooming. Although I do not now grow the Browallia as a winter-blooming plant, I have formerly obtained very satisfactory results by starting young plants about the first of July, and then planting them out in a deep, rich border as soon as they were large enough. Then they were well cured for, and pinched back occasionally so as to cause them to assume a bushy shape, and about the 10th of September taken up and potted, and on the approach of cool weather brought inside. They were given a light, sunny situation and an average temperature of 55 degrees. When well grown they are very pretty plants for greenhouse decoration during the winter season, although they are of little or no value for cut flowers. Plants that have flowered all Summer will not do well in the winter, no matter how well they are cared for. The Browallia prefers a compost composed of two-thirds turfy loam and one-third well decayed manure. In potting use pots proportionate to the size of the plants, and see to it that they are well drained, and sprinkle or syringe the plants freely to guard against the attacks of the red spider, to which pest they are unfortunately very subject when grown under glass.

L. M. M., NORTH FERRISBURG, VT.—In a late RURAL, in answer to an inquiry about hardy shrubs, Deutzias were recommended. They are quite tender here.

Miscellaneous Advertising.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

ALCANTARA AND ALCYONE.
By GEORGE WILKES, dam ALMA MATER, by MAMBRINO PATCHEN.
The success of George Wilkes on the turf and as a sire, with the high rate of speed shown by each of the produce of Alma Mater at an early age, will enable these horses to transmit the qualities of their sire and dam with great uniformity.
Terms, $150,
At time of service. Usual privilege of return.
For catalogues, address
J. G. DAVIS, Agent, Lee, Mass.

EGGS from W. Leghorns, P. Rocks, or Black-Red Games, $1 50 for 13. *Eggs from Choice Fowls only.* Mention this paper. **C. E. RICK,** FAIRVIEW, PA.

SMITH & WALKER, Lee, Mass.
Breeders of twelve varieties of high class standard Poultry. Eggs cheap. Send for circular, free.

Pure Brown Leghorns.
I will furnish Eggs from pure stock, nicely packed in baskets, for $1.50 for 13; $2.50 for 26.
H. W. BRINK, MIDDLETOWN, N. Y. Box 161.

HOW TO MAKE COMMON POULTRY PAY!
Seven years' experience of a MARKET POULTERER, on THE JOHNS HOPKINS UNIVERSITY FARM. Enclose ten cents to **CHAS. C. BUCK & CO.,** Cor. Howard and Franklin Sts., BALTIMORE, MD.

WYANDOTTES.
Won Special on Highest Score and Third Premium on pair of Chicks at the New York Fanciers' Show in 1884.
Won First and Second on Fowls and First on Chicks at Middletown, N. Y., in 1884.
Won First on Breeding-pen of Fowls and First on Breeding-pen of Chicks, and First on pair of Fowls a Newburgh, September, 1885.
FOWLS AND CHICKS FOR SALE.
EGGS, **$3** per 13; **$5** per 26.
DR. E. W. DEYO,
Box 103, MONTGOMERY, ORANGE CO., N. Y.

DARK BRAHMAS.
Won first on Breeding Pen of Fowls, first on Breeding Pen of Chicks, first on Pair of Chicks and second on Pair Fowls, at
NEWBURGH, September, 1885.
Fowls or Eggs in Season.
EGGS, $2.00 per 13; $3.50 per 26.

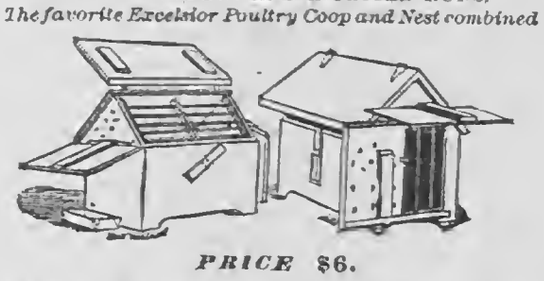
NAPKNOLL'S
PROGRESSIVE POULTRY COOPS FOR HENS AND CHICKS,
WITH BROODERS AND INCLOSED RUNS.
The favorite Excelsior Poultry Coop and Nest combined



***PRICE* $6.**
Gold and Bronze Medals were awarded at the Great Show of New York Fanciers' Club, February, 1886.
Have you anywhere else in the world seen Chicken Brooders and Inclosed Runs that may at pleasure be either attached to or detachable from the coop?
If you have not any such coops or brooders, send a two-cent stamp for one of the illustrated Descriptive Catalogues, with terms and Price List.
NAPKNOLL POULTRY COOP CO.,
GOSHEN, ORANGE CO., N. Y.
AGENTS:
NEWELL & CO., 127 State Street, Boston, Mass.
L. N. CLARK & SON, 88 Dey Street, New York.

LINSEED OIL-CAKE MEAL.
ABSOLUTELY THE BEST FEED FOR
CATTLE, HORSES, CALVES, SHEEP AND HOGS.
The Oil Meal from the mills of the undersigned is found by many Feeders of
LIVE STOCK
to be of great service during the
SUMMER MONTHS
when grass is good. No room here to give particulars; but try it, and you will see the good results. It is sold by all leading feed dealers.
Mr. JOHN KING, NORRISTOWN, PENN., is General Eastern Agent.
Cleveland Linseed Oil Co., Cleveland, Ohio.
Toledo Linseed Oil Co., Toledo, Ohio.
Detroit Linseed Oil Co., Detroit, Michigan.
I. P. Evans & Co., Indianapolis, Ind.

Cincinnati Linseed Oil Co., Cincinnati, Ohio.

MAPLE LAWN POULTRY YARDS AND KENNELLS.
Breeders of Wyandottes, P. Rocks, White and Brown Leghorns and Pekin Ducks. No more stock until Sept Eggs for hatching until July 1st. Agent for Poultry Culture by I. K. Felch.
Imp. Scotch Collie Dogs bred direct from Tam. O'Shanter and Imp. Goffa. Send for circular.
WESLEY B. BARTON, Pittsfield, Mass.
P. S.—4 fine Collie pups for Sale. References.—I. D. Ferry, cashier Agricultural Bank, Pittsfield, Mass.

Half-Way Brook Kennels and Poultry Yards.
LOCK BOX 459, **GLENS FALLS, N. Y.**
OUR SPECIALTIES.—St. Bernards, Eng. Mastiffs and Eng. Beagle Hounds. Imported Dogs in the Stud. Fees reasonable. Can furnish dogs of any of the popular breeds, at low figures, for quality of stock.
IN POULTRY.—We breed the best and most popular varieties of land and water fowls. Stock for sale at all times. Eggs in their season. Send stamp for circular. **COFFIN, ZIMMER & CO.**

BLYTHECOTE FARM POULTRY YARDS.
INTELLIGENT BREEDING PAYS! BLYTHECOTE STRAIN OF WYANDOTTES.
Annual improvement sought by careful matings selected from the best. One setting of choice Eggs will produce more first-class birds than ten settings from inferior stock. A limited number for sale from the above yards this Season. Price, $3 per Setting of 13; Two Settings, $5; Five Settings, $10.
Address **J. D. TOMPKINS, Brainard, N. Y.**

MILL BROOK
POULTRY YARDS AND KENNELS!
40 breeding pens of selected Wyandottes, Langshans, W. and **Br. Leghorns,** P. Rocks, Lt. Brahmas, B. C. W. Leghorns, B. B. R. Games, Pekin Ducks. Eggs, $3 for 13, $5 for 26, $7 for 39. Duck eggs, $2 for 11, $3 for 22. Nine hens and one male to each pen. *I guarantee a good hatch. Try me.*
Champion St. Bernard Dogs, Champion Scotch Collie Dogs. Young stock for sale at reasonable prices. Champion mouth organ "Merrie Monarch," in the stud. Send for Catalogue.
WM. MONTGOMERY, Jr., Bergenfield, Bergen County, N. J.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MAY 29, 1886.

PRES. WILDER kindly writes us, in reply to our note of inquiry last week, that his Parker Earle Strawberry plants all have variegated foliage, though free growers "which," he continues, "is not generally the case with plants which sport in this way."

BEGINNING with the next issue of the RURAL NEW-YORKER, our accomplished contributor, Emily Taplin, will assume the charge of the Woman's Department. Contributions from our friends, however short, are solicited. It is desired that this department, more than ever before, should be made instructive and interesting to our lady readers.

THREE years ago we began to offer a horse Prickly Comfrey two or three times a season. At first he merely smelt of it. The second year he ate a little. This year he eats it greedily, leaves and stalks, in *preference* to grass or clover. He is the first animal we have ever known to relish this plant, which, as it grows with us, will produce a larger amount of green food than any other forage plant we know of, as it may be cut several times every Summer.

SIR J. B. LAWES, in reply to our questions, writes as follows:—"It is quite true the manures named by you" (nitrate of soda, sulphate of ammonia and blood) "are soluble and active in the order named. With regard to using them, I am disposed to think that some regard should be had to the cost of these substances. For corn, I think that nitrate of soda would prove the best manure, provided the necessary phosphates and alkalies are in sufficient quantity in the soil. If the nitrogen in nitrate of soda is as cheap as it is in other forms, it is certainly the best manure."

IT is becoming the fashion now-a-days among certain farm journals that are mean and dishonest enough to do such things, to copy from the public reports of distinguished farmers and horticulturists in such a way as to make it appear that the quotations are written specially for those journals. Thus we see the names J. B. Lawes, W. J. Beal, Marshall P. Wilder, P. Barry, T. T. Lyon, J. L. Budd, L. B. Arnold *et al.* appended to articles or paragraphs taken from public addresses, annual reports, etc., without any credit whatever. These are pretty examples for the editors of respectable farm journals to set!

OUR Government has demanded from the English Government the surrender of the two fishing vessels seized by the Canadian authorities. Should the latter condemn and sell them, it is likely a demand for indemnity will be made on the Imperial Government. There is a great deal too much intemperate talk in the papers about this fishery squabble. There is no doubt that the Canadians have a fair prima-facie case. The matter at issue is merely the construction of a treaty, and passion will prove no satisfactory help in arriving at a correct interpretation. The question will be ultimately decided by the Governments at Washington and London, and we believe that the trouble will be adjusted through British repudiation of the Canadian attitude.

THE city relative is now looking very graciously towards the country cousin. The summer vacation approaches, and there will be an unusual demand this year for country board. There are hundreds of city families who could hardly get through the year but for the help afforded by their relatives in the country, and it is surprising that it is, in general, this very class that has the most sneering to do at the farmer's life. The relations between city and country people have always been peculiar. Each class appears to thoroughly misunderstand the other. The country has always distrusted the city, while the city has been disposed to look down upon the country. There is no reason why this should be so. City wage-workers, as a rule, endure as great a care and worry as any farmer; while the intelligent farmers of to-day are as well read and as generally well-informed as the majority of city men.

IT is estimated that the losses of all kinds due to the numerous strikes and lockouts throughout the country during the past six weeks, foot up about $50,000,000. Many of the workmen had to run into debt; others have spent their savings; large numbers have become badly demoralized. Even if the number on strike was at any one time not over 125,000 (the number out on May 12), these figures would by no means indicate the number compulsorily idle on account of the troubles, for in many cases the strike of one trade necessitates suspension of work in which many others are engaged. The number of strikers on the "Gould system" was at no time over 7,000, and some put it considerably lower; but owing to the action of these, at least 15,000 others were thrown out of employment. It is to be hoped that some means will be devised by the thousands of heads now pondering on the problem, by which a recourse so disastrous to employés, employers and the innocent public may be hereafter avoided. If all the money lost by the strikers and contributed for their support were collected as capital, what a splendid beginning could be made in some co-operative industry.

LIKE the anti-oleomagarine law of Holland, that now before the English Parliament lays no tax on the product, but provides stringent regulations for its sale as an imitation of butter, and heavy penalties for violations of the law. It requires the name of the concoction to be put on each package in letters at least an inch long, and punishes a first violation of this provision by a fine not exceeding $100; a second by a month's imprisonment or a fine of $250; and a third offence is punished by six months' imprisonment. Each manufactory is to be registered and open at all reasonable hours to inspection by Government officers. A penalty of $25 a day is imposed for not registering. The place of manufacture must be clearly stated in every invoice, and the goods must be sold as oleomargarine or margarine. Neglect in this matter renders the seller liable to a fine of $500 for each offence, and he cannot recover from the purchaser the price of the goods sold. Retailers must inform purchasers what the article sold is, under penalty of $50 for the first offence, $100 for the second, and a month's imprisonment for the third. Any one shipping the product must state its real character or forfeit $2 for each package not booked according to law; and the transportation company must enter the goods on its books under the description given.

ONE of the most effective temperance documents we have seen lately is driven into the city every morning. It is a low milk wagon, the back of which is so arranged that it can be easily let down and turned into a counter over which milk is retailed at five cents per glass, with buttermilk at three cents. It is good milk, cleanly served, and kept cold and fresh. From the place where this wagon stands, in front of the post-office, there are within sight, by actual count, 15 places where whisky and beer are sold. Yet, even at this cool season, the sale of milk is large, and in the Summer it will be enormous. The trade increases from year to year, especially that in buttermilk. Temperance advocates will find a practical lesson in this business. Fight saloons with milk. Establish milk saloons throughout the business part of the city, the nearer to the whisky saloons the better. Put the price of a large glass of pure milk at three cents, and the rum-sellers' business will be sadly interfered with. There is a good opening here for some benevolent person who has money enough to establish the business and foster it until it can be made self-sustaining. There is not a town or city in the country in which trade of this kind should not be profitable.

THE FARMER'S COW.

LAST year, after much discussion, the Ohio State Board of Agriculture offered a special premium for the best general-purpose cow. It was designed to organize a contest between the different breeds in which beef qualities, milking qualities, gentleness, working qualities, and, in reality, fighting qualities as represented by horned and polled breeds, should be taken into account. The plan failed last year owing, doubtless, to lack of time for preparation on the part of breeders. We hope an attempt will be made this year to carry the idea through, for it is a good one. It is not probable that the question will ever be settled to the satisfaction of everybody. No single specimen of any breed can ever satisfactorily represent that breed, and no single breed can ever give satisfaction in all parts of the country. Different farms, different farmers, and different localities and soils require different breeds of cattle. That has been demonstrated beyond a dispute. Yet these contests between breeds will be of value, though the result may not be at once apparent. They will show breeders the weak points in their animals, and will help to point out the characteristics which are most generally desired by farmers. Let us have such contests, by all means. They might well be made a feature of every prominent exhibition in the country.

IS IMMIGRATION A BLESSING?

THE labor agitation is bringing the question of the immigration of cheap labor prominently to the front. During the five years ended December 31, 1885, 2,839,997 immigrants arrived in this country against 1,127,997 in the previous five years, an increase of over 150 per cent. For this period Chinese immigration increased only 10 per cent.; and during the last three years, since the enforcement of the Restriction Act, there has been a heavy decline. Europe furnishes the United States with 98 per cent of all immigration, and with nearly all the unskilled cheap labor and pauperism we get from abroad; and this sort of immigration is increasing much more rapidly than any other. Here is an instructive table compiled from official statistics of immigration for the two periods above mentioned,

FIVE YEARS ENDED DECEMBER 31.

	1880.	1885.
Women and Children	511,408	1,266,822
Workers	435,620	1,169,900
Totals	947,028	2,436,722

Here is the classification of the workers:

	1880.	1885.
Mechanics	217,810	365,700
Traders	43,563	116,928
Professionals	21,781	58,484
Unskilled	152,467	628,788
	435,620	1,159,900

Thus, while the number of mechanics, traders and professionals increased 91 per cent. in the five years, the number of unskilled laborers increased 313 per cent. The greatest increase in this undesirable class came from Italy, Prussia, and Hungary, the immigration from which is nearly all unskilled, cheap, and poverty-stricken. During the last five years the aggregate increase from these three countries was 94 per cent. more than from the rest of Europe. Is immigration any longer a blessing, is becoming one of the questions of the day.

LAND LEGISLATION.

THE public lands now remaining to the United States amount to only about 200,000,000 acres. Last year 20,113,663 acres went into the hands of corporations or private owners, and 261,649,319 acres the year before. If the public domain continues to be taken up at this rate, how long will any remain? This consideration has given a great deal of prominence to land legislation in Congress during the present session. A large number of bills relating to various corporations seek to restore to the public domain about 130,000,000 acres withheld from settlement in favor of railroads which have no legitimate claim upon it. The House has just passed a bill creating a commission of three persons to ascertain and settle land claims in Colorado, New Mexico and Arizona, held under Spanish or Mexican grants and treaties, and it is provided that "no alien or person not a citizen of the United States shall acquire any land under this Commission, unless his title to the same shall be clearly proved under some of the treaties or grants." Enormous frauds in connection with these old land grants have already occurred, and the number of exaggerated and fraudulent claims now outstanding cover vast areas, and a large proportion of them are in the hands of foreigners. Over 30,000,000 acres are owned in large bodies by aliens, besides a large aggregate area made up of smaller possessions, and vast tracts of the public domain are occupied rent-free and illegally fenced by alien cattle kings and corporations. A bill is now before Congress prohibiting alien ownership of land in the Territories. This affects only the land in the latter, where the General Government is supreme, and cannot, of course, affect the present holdings; but the passage of the bill would prevent an increase of an acknowledged evil. The States must deal with the question within their own limits, and the Legislatures of Illinois and Iowa have been discussing it of late.

CO-OPERATIVE SOCIETIES.

THERE is a good deal of talk just now in various parts of the country of different means for getting rid of labor troubles and lightening the widespread, prevalent distress, and co-operation in manufacturing and marketing goods is frequently suggested as an expedient. Co-operation in work is as old as civilization; but co-operation in marketing—distributive co-operation—is a development of the last half century, or less. England is its birthplace, and the most notable instance and success is the Rochdale Equitable Pioneers' Society, which was formed in 1844, with 28 members, for the purpose of selling to the members and others groceries at the prices current in the town, the profits to be divided among the shareholders. The original capital of $140 was raised by $5 shares; last year it closed with a membership of 11,084 and a capital of $1,623,000. In 1850 its trade amounted to $65,000, and its profits to $4,250; last year the former was $1,260,000, and the profits $226,000. It owns a central establishment which cost $70,000, and 20 branch stores, built or bought, besides two libraries for its members and a school of science, languages, and the mechanical arts. The business has steadily grown from the outset; there has never been a loss or even any considerable falling off in profits.

Besides this, there are also in England half-a-dozen other distributing societies with annual sales of over $1,000,000 each, and 22 with a yearly business of over $500,000, but under $1,000,000 apiece. Altogether, there are in the United Kingdom 1,350 co-operative societies; in Germany, 3,639; in Austria, 1,515; and in all Europe a total of 7,669, of which 2,649 are in trade. The remaining 5,020 comprise 3,617 people's banks, and 1,403 agricultural and productive co-operative associations. Several enterprises of the kind have been started in this country, but hitherto generally in a small way, and the most successful have been those connected with the Granges in some of the States.

BREVITIES.

A FRIEND writes: "Five eggs of my best Langshan hens weigh one pound, good weight," which surprise us.

HUNGARIAN Grass may be sown now or later. Sixty days will suffice for its growth. Sow on mellow soil—a bushel to the acre—and cut when the heads appear.

MANY city people select asparagus with long white stems in preference to green stems, forgetful that the white is the older and tougher part. Asparagus grows from the tips, and the more green there is the more tender the shoots.

THE praiseworthy Report of the Ohio Ag. Ex. Station has just been received. It is much to be regretted that it could not have been issued several months earlier; then farmers might have availed themselves of its information the present season.

WE have already said that the quality of the State of Maine Potato, which is one of the best keepers and a large yielder as well, is inferior. A few were boiled and eaten last week, but they were of poorer quality than earlier in the season. In fact, we should not eat potatoes if a better quality could not be secured.

DO any of the lady readers of the RURAL wear birds on their bonnets? We hope not. But if they do, we hope they will not do so any more. In all seriousness, we think that this fashion is not only cruel and unwomanly, but that it is effecting incalculable injury to the farmer's interests. Are we right? If not, tell us wherein we err. If right, then lend your aid, lady friends, to throw disgrace upon this senseless, heartless, iniquitous custom.

IT has been stated often enough that heavy applications of sifted coal ashes about the roots of currant and gooseberry bushes, will keep them free of the currant worm. We have given this a thorough trial, and find that the bushes so treated are just as much infested as the others. Somebody, probably, mulched his bushes with coal ashes. They happened to escape the worm that season. He wrote about it to his farm paper, and it has been going the rounds ever since.

MR. GEO. C. RIXFORD, of Rixford, Florida, sent us, May 13, a few mulberries from a variety so much superior to any he has seen, that he is disposed to try it. He has the Downing's Everbearing, but those who taste the new kind have no wish to eat the other. The tree is four years old from the cutting. The berries had begun to ferment before reaching us. They were nearly two inches long, and about half an inch in diameter—long and round, with small, crowded drupes of a reddish color.

THE element of hope is a necessary part of all successful agriculture. Unhappy indeed is the farmer's lot who never expects to do better farming and sees no possible prospect of improvement before him. Hope directs every farm improvement. We grade up our stock, try new grasses or fruits, buy improved implements and study new methods because we hope, through their help, to make life broader and better. The times are close and many farmers are pinched as they have not been in years, but let us not think of giving up. Let us rather hope for the better times that surely must come again, and in the meanwhile study to cut off every habit or method that stands in the way of true economy. If we can do this and hold to the good resolutions when the times get better again, we may live to count the "hard times" as a blessing.

Farm Economy.

A FEW THOUGHTS ON THE SIGNS OF THE TIMES.

Labor agitation and agriculture; combination in other industries; disadvantages of the farmer as a buyer and seller; what must be the end? Need of co-operation.

THE agitation now pervading all classes and industries, looking to a decreased number of working hours and an increased compensation for labor; the combinations and organizations of manufacturers, merchants, and tradesmen generally for the purpose of advancing, or at least upholding, present prices of manufactured products, demonstrate more clearly than any series of events of recent years the unfortunate and defenceless situation of the farmer. The workingman, by organized effort, can in a measure regulate and even dictate the price he shall receive for his labor. The manufacturer, by combination with manufacturers of similar products, can and does regulate the price he shall receive for his manufactures. The merchant, by similar means, can set an approximate price for the goods which are displayed on his shelves and counters. But our farmers, the bone and sinew of our country, the hardest-working, most industrious, careful, and reliable class of men our body politic contains, are by the very nature of their calling placed at a tremendous disadvantage.

As buyers, the prices of all necessaries, luxuries, and commodities are arbitrarily set for them, and they are powerless to regulate the prices of the goods which they stand ready with the money in their hands to buy. But as sellers they find themselves placed at even a greater disadvantage. Each one finds himself the competitor of the others, without the slightest chance for combination or original effort. Each is used by the wily buyer as a lever to reduce the price of his neighbor's produce, and fettered as he knows himself to be by his circumstances and his calling, the farmer victim gives up the hopeless attempt to obtain a fair remuneration for his toil and labor, and meekly accepts whatever price the buyer may see fit to offer him.

The signs of the times show danger ahead for our farmers. For several years prices of agricultural products have gone steadily downward, while the wages of the laboring classes are steadily advancing, and the prices of the many necessaries the farmer must purchase are gradually increasing. The prices of what he produces are steadily decreasing, while the prices of all that he consumes are advancing. Where must such a state of things inevitably lead? He sees his candle burning at both ends, yet is helpless to prevent it. He sees his daily income gradually growing less and less and his outgo growing more and more; can there be but one result to this state of affairs? Is not bankruptcy the only termination of such a situation?

Then, where lies the remedy? Who can solve the problem? Its solution I leave to older and wiser heads than mine; my object is only to sound a note of warning as to whither we, the farmers of America, are drifting, and to point out our helpless, and I may add, almost hopeless situation. It is true the persons now engaged in agricultural pursuits in the United States number over eight millions, a number nearly twice as great as that of those engaged in manufactures and mercantile pursuits. It is true that the capital invested in farms, buildings, stock, and improvements is also twice as large as the combined investments of the manufacturing and mercantile industries of our country. Surely, then, with such a vast power in their hands, the farmers should and could obtain a more just recognition of their rights and privileges than they now have, and will have but themselves to blame if they are not accorded a more potent influence in the management of the financial and political interests of our country. How to attain that influence, how to secure the legitimate fruits of their capital, energy, and industry, that is the problem we ask to be solved.

Does the answer lie in more thorough co-operation—co-operation in buying and co-operation in selling? Should we stand shoulder to shoulder, and by organized, systematic co-operation "strike" for that position in the world of business and industry to which we are entitled. We must either rise or fall. We cannot stand still. We have been, and now are daily falling behind in the march of industrial progress. Shall it continue? Shall we, the farmers of America, stand idly by, and see the brave old ship of Agriculture drift swiftly down upon the reefs of bankruptcy? That is the question of vital importance to each one of us to-day, and if we look for the answer it will be found in agitation. Let us first agitate, and then as the only logical sequence we must co-operate, and in co-operation only lies the future safety of the American farmer. W. E. S.

Rensselaer Co., N. Y.

A HANDY MARKER.

MR. REUBEN TOWNSEND, of Cape May Co., N. J., sends us the drawing for the handy implement shown at Fig. 232. It is intended to

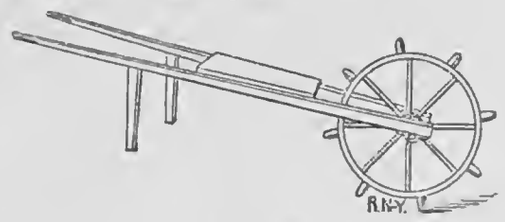

Fig. 232.

mark the rows and the places for planting potatoes, cabbage, beans, sweet corn, etc. The ground is prepared in the usual way and smoothed with the harrow and drag. The marker is then wheeled over the rows. The indentations made for the seed are all the same depth, and the same distance apart. The frame of the implement is made very similar to a wheel-barrow. The wheel is of any convenient size, say, two-feet in diameter. The felloe of the wheel is punctured with holes as near together as the closest plants will be planted. The markers can be inserted in any of these holes, so as to give any desired distance between hills. These markers are made of wood with the part which enters the wheel made to fit closely into the holes, while the hole-making portion is made egg-shapped, so that the soil will not so readily adhere to it. The depth of the drills is regulated by a bag filled or partly filled with sand or stones, the weight to be regulated to suit the depth of trench required.

CORN MARKER.

HENRY C. MARVIN has used a corn planter like that shown at Fig. 233 for two seasons, and says it works well. The head is made of 4x4-inch scantling. It is jointed so that when

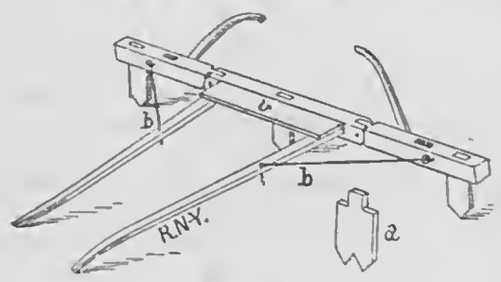

Fig. 233.

used on uneven ground all the teeth will touch at the same time. Two mortices are made at the ends of the head for outside teeth; one being three feet from the center tooth, for marking potatoes, and the other four feet for marking corn. Two sets of teeth are used, those in the frame being for general use, and that shown at *a* when corn is to be planted with a hand planter. This double tooth leaves a little ridge of mellow soil, and the corn is covered much better. The iron bars *b b* are three-eighths of inch in diameter, fastened at one end to the head of the marker by a staple; the other end is hooked into a hole in the thrills. This rod is to prevent the head from being split at the joint by the end tooth. The teeth and thills are made of inch-and-one-half plank. The handles from an old plow or cultivator will answer.

Various.

CATALOGUES, ETC., RECEIVED.

PUMP AND HAYING TOOL WORKS.—Catalogue from F. E. Myers & Bro., Ashland, Ohio.—An elegant, neatly printed statement of the superior points claimed for the tools manufactured at this establishment. F. E. Myers & Bro., by purchase from the Ashland Pump Co., become sole owners of all patents, machinery etc., heretofore used in the construction of the celebrated Ashland pump. A number of new patents and improvements in pumps and haying tools have been introduced, the aim being to make such machines second to none. The peculiar features of the Myer's Pump are the patent glass valve-seat and the expansive plunger. These have proved very successful. They are fully illustrated and explained in the catalogue. Anti-freezing deep well pumps, drill well, force and lift pumps of the best make are manufactured, as well as pipe and hose fittings and tools. The list of haying tools includes double lock carriers, wooden and steel tracks and nickel plate carriers, pulleys, sling attachments, grapple and harpoon hay forks and numberless smaller tools.

BRINSER GRAIN CRADLE.—Circular from E. C. Brinser, Middletown, Pa.—The age of self-binders and reapers is not by any means complete. There are thousands of good farmers who still find good use for a grain cradle. Even on the great grain farms of the West there are many places where a man can make good wages with a cradle. All farmers will be pleased with the Brinser cradle. Thousands are in use in many States. The best white ash is used for wood work. The fingers are sawed to the proper shape, and are thus better than the steam-bent fingers. Each finger is well braced with a wire brace having good thumb nuts inside and outside the snath to regulate at will. Send for the circular and read what others say.

PORTABLE POULTRY FENCE.—Circular from Sam'l H. Roberts, 12 Lispenard St., New York. A new and apparently happy idea. The fence is a combination of twine netting and wire. It may be run 75 feet between trees or posts. It can be used alone or in connection with other fences. It is so easily put up and removed that the poultry runs can be readily shifted or changed in size or form. It will be particularly valuable for use in orchards or in grain stubble. The price is given at six cents per running foot (four feet high) with a discount when large quantities are taken.

HOME PHOTOGRAPHY.—Pamphlet from Franklin Putnam, 485 Canal St., New York. The desire for having a "picture taken" is universal. There are dozens of objects about the home that might well be preserved upon paper. Such pictures would be doubly attractive if the work could be done at home. It is the design of the above-mentioned house to send out complete outfits of photographic goods, with such complete instructions that amateurs can readily learn to do fair work. The outfits are furnished at $13 or $20. We have seen samples of work done by amateurs with these outfits. It is certainly very fair.

Thomas Hood is the name given by a more than usually profane scoundrel who is advertising "green goods" for sale in this city. This is the old "sawdust swindle," which has been exposed over and over again in this department and in other papers all over the country. It was thought by some that the murder of Tom Davis, one of the principal rascals engaged in the "business" here, some months ago, by a Texas desperado, while negotiating for the "goods" in one of his dens, would have a deterring effect for some time at any rate; but, bless you! the crooks in that line have been unusually busy ever since, and unusually successful in swindling dishonest fools, who wished to get from them counterfeit money to be passed off as genuine among their friends and neighbors. The business is always done by sending circulars through the mails. The person addressed is assured that his name was obtained through a friend passing through the place. This is always false. There are men here who make it their sole business to collect lists of names from directories, advertisements in various papers, lists of newspaper subscribers when they can get them, and a multitude of other sources, and these they sell for so much per 1,000 to any body. Many of them are classified, so that people in a certain line of business may appeal to those most likely to become patrons. Thus people with chronic or imaginary diseases are grouped together for the benefit of advertisers of medical nostrums; those who have been duped by one swindle are bunched for the benefit of other swindlers; for the gudgeon who bites at one bait, is pretty sure to jump at another, however severely he may have been damaged by the first. The names of those who receive letters and circulars from strangers are generally obtained by the latter from these "dealers in names." Murdered Tom Davis was constantly sending out circulars, and had 18 different addresses in this city, a different name being given for each. On asking for Hood at the address given in his circular (a mean little cigar store) the Eye-opener was informed that no such person was known there; but the rascal got his mail there, nevertheless. In no case is counterfeit money sold; and those who are mean, dishonest and contemptible enough to try to get it, are pretty certain to be swindled.

In the RURAL of April 24th, we advised our readers "to have nothing to do with the 'new seed oats' offered by a certain seed company of Western New York. The plan followed by the company is precisely that by which hundreds of farmers have been heavily swindled by other companies offering Bohemian and Hulles Oats, Seneca Chief and Red Line Wheat, etc. Ten or $15 a bushel are charged for the seed, and a contract is made to buy back a certain proportion of the product (usually twice the amount of seed purchased) at the same price. Many other companies, which have swindled their patrons, have had the names of quite respectible people on the list of officers. With regard to this "seed company," a good friend of the R. N-Y, writes us: "I fear a late Eye-Opener did Mr. A and his seed company a bad turn. Mr. A is an honest, conscientious man, and the company are honorable, and I am quite sure they will do just what they offer. I think the oat is a good one, and though the method chosen to put it out may look a little 'wild catty,' I have no doubt but it is legitimate."

Quite a number of papers, some of them really "high-toned," are advertising ORANGE GROVE TRACT OF 40 ACRES FREE, in Florida. The offer is made, it is claimed, "for the purpose of organizing a local colony" in the recipient's neighborhood; and he, of course, is expected to work in getting up such a colony and getting them to pay hard cash for land on the sandy dunes of the Florida coast. It is in repayment for such work that the "tract" would be given, and, therefore, it would not be "free." We were offered an interest in the same place for publishing such an advertisement, but knowing the thing to be a wild-cat scheme of a parcel of land speculators, we declined to have anything to do with it on any condition. The place has been exposed already here among the Florida land frauds.

TO SEVERAL INQUIRERS.—Yes, there is such an "institution" as the "Civiale Remedial Agency" in this city. It will, most likely, send what it is ordered; but its claims on behalf of its remedies are greatly exaggerated; and as effective a "cure" as the best of them could be got for less than half the price at the nearest drug store.... We cannot recommend Heine & Co., of this city, who advertise to send, for $1, instructions by which a child can learn in a few minutes how to play the piano or organ. Only a child, and a very foolish one, would send money to such an obvious, barefaced humbug. By the way, one of the latest swindling schemes is that of the philanthropic sharpers who are anxious to put an organ in every farmer's parlor. They will send a specimen free as an advertisement in the neighborhood; but, "as a proof of good faith," they require a pittance of $4 to pay freight. Two or three weeks after the "fool and his money have parted," a 25-cent mouth organ arrives for the parlo .....

Literary.

BOOKS RECEIVED.

SIGNS AND SEASONS. By John Burroughs. Published by Houghton, Mifflin & Co., Boston, Mass. Price, $1.50.

John Burroughs is one of the pleasantest writers that we know of. His style is exactly suited to his theme. He is an enthusiastic observer and student of nature, and sees thousands of wonderful little things in the woods and fields which we, with our uncultivated eyes, would pass unnoticed. The book is made up of short essays which have already appeared in the magazines. The "Tragedies of the Nests" and "Bird Enemies" will be read with peculiar interest at this time, when such strenuous efforts are being made to protect our little feathered friends.

LEND A HAND. A new monthly magazine. Published at 3 Hamilton Place, Boston, Mass.

This magazine occupies a unique place in literature. It is a journal of organized charity, having for its main object the fostering of worthy charitable institutions and the discussion of the best methods of reaching and helping the unfortunate. In its teachings and spirit it is designed to be but an elaboration of that best of all English mottoes—"Look up and not down; look out and not in; look forward and not back, and lend a hand." The magazine is edited by Rev. E. E. Hale, who is assisted by so able a staff of contributors that it goes without saying that the literary features of the new publication are admirable. We know of no magazine more worthy of the support of benevolent persons than Lend A Hand.

FORGOTTEN MEANINGS. By Alfred Waites. Published by Lee & Shepard, Boston, Mass. Price, 50 cents.

This little book is rightly called "An Hour With a Dictionary." It is as though some student of words had invited us to glance through the dictionary with him, and listen to his explanation of the real meaning and derivation of such words as we may chance upon. We do not think however, that an ordinary person would select many of the words given in the book for explanation. They appear rather to be the selections of one who wished to present the curious or strange, yet any English scholar will find much to interest and instruct him in

this little volume. There is a peculiarity about the use words that is almost unexplainable. We are often at a loss for the "right word" in writing or speaking, yet the dullest of us will never fail to appreciate, in an instant, nice distinctions in the use of words by others.

SAINT GREGORY'S GUEST AND RECENT POEMS. By John G. Whittier. Published by Houghton, Mifflin & Co., Boston, Mass. Price, $1.00.

We doubt if any American can ever give a really just criticism of Whittier's poetry. There is so much of reverence mingled with any inclination to find flaws that the review always flows into an expression of admiration. Whittier is peculiarly the American poet. There is an earnest strength about his poetry that lodges it firmly in every home. The present volume has none of the fierce vigor which characterized his ringing poetry of 25 years ago: but there is a gentleness and tenderness about it which is quite as irresistable. Perhaps we cannot say that "The Light That is Felt" is the best of all Whittier's poems, but to our mind it is the equal of any. Nothing could appeal more powerfully to New England's wandering children than "The Homestead."

"O wanderers from ancestral soil,
Leave noisome mill and chaffing store;
Gird up your loins for sturdier toil
And build the home once more.

What matter if the gains are small
That life's essential wants supply?
Your homestead's title gives you all
That idle wealth can buy.

Your own sole masters, freedom-willed,
With none to bid you go or stay;
Till the old fields your fathers tilled,
As manly men as they.

With skill that spares your toiling hands,
And chemic aid that science brings,
Reclaim the waste and outworn lands
And reign thereon as kings!"

For Women.

CONDUCTED BY MISS RAY CLARK.

AN OLD PICTURE.

WHEN I was a child, a quaint old-fashioned copy of Bunyan's "Pilgrim's Progress" held within its leathern covers for me a mine of never-failing richness and delight. And before I was six-years old, I would sit for hours and even days in some quiet corner, reading and re-reading its finely printed pages and studying its strangely suggestive pictures, until the characters therein portrayed seemed to my imaginative mind as real as the people whom I met in my daily life. One picture in particular had a wonderful fascination for me. It was that of the man with the muck rake with bent body and sweat dripping from his face, eagerly scraping together the straws and rubbish with which the ground was strewn, while above him hovered a bright-winged angel holding out for his acceptance a jeweled crown, the existence of which his constant downward gaze prevented him from discovering. Oh! how I longed to take that man's head in my two hands and direct his eyes from the worthless heap he was accumulating to the treasure above him which was within his reach. And often my mind reverts to that picture, as I see people so eager in the pursuit of perishable pleasures and possessions, seemingly unconscious of, or not caring for, the inestimable riches of knowledge, human affection and forbearance, and those treasures which are imperishable.

Standing on the porch the other morning, the clear air wafted to my ear the harsh, angry tones of a father's voice swearing at his two little boys for some childish carelessness, and as I hastened into the house to avoid hearing the horrible stream of abuse and profanity which poured from that father's lips, that old picture seemed to spread out on the wall before me. Here is a man, who, at the thought of the expense of a dollar or two, for repairing the damage done, allows his passions full sway, and gives such an exhibition of his temper before those whose natural right it is to look up to and revere him, as must effectually check the growth of either love or respect. Unkindness, quarreling, and cruelty to animals from others are passed by with no comment. He has no comment. He has no time to attend to such matters. But a torn garment, a broken tool, or a forgotten duty, will almost invariably call forth a torrent of profunity. Yet this man is called a good citizen. His farm is well managed and productive, his buildings neat and orderly, and no doubt he loves his boys, but does not realize the great importance of controling his temper for their sakes. But "those who sow the wind shall reap the whirlwind," and those little boys who now stand white and trembling under their father's wrath will soon begin to say, "I don't care if father does scold." In a few years they will begin to swear back, and there will be two to one. And if in the future, after some furious altercation, the boys shall in the heat of anger leave their home and their parents, and rush with swift feet on the downward path to destruction, would their father have reason to wonder or to blame? Perchance his eyes would then be opened to see the folly of his own conduct. When his idolized farm shall have run down for want of interested help in its cultivation, when he sits alone in his silent home and unconsciously listens for the free, quick step of youthful feet, then he will realize that the treasures he has gathered are a worthless burden, and that priceless jewels have, by his own foolish conduct and neglect, been lost for time and eternity.

I spent a few days in the home of an old friend and schoolmate. Order and cleanliness were observed in the minutest detail of her housekeeping. The house was commodious and well arranged. The walls were daintily hung and adorned with handsome pictures. The carpets were bright and spotless, and the furniture free from scratch or stain. The table was perfect in its appointments and the welcome unmistakable; yet the visit, which had been so long and pleasantly anticipated, was a sad disappointment. I could hardly recognize in the fretful, impatient, worried mistress of this home the merry, good-natured school-girl of former days. The rooms, in spite of their cheerful furnishings, seemed dreary. Not a plant or bird tempered the glaring brightness of her polished windows. A book or paper was not for a moment tolerated in a careless position on stand or table, and her little girls were allowed no playthings, lest they should "litter the house." My heart ached for the little things who sat still and knit or pieced blocks all day long, and were not even allowed to vary the monotony of their tasks by wiping the dishes, as they begged to do, as their mother was so very particular she must do everything herself.

I heard no little confidences or playful words between mother and children, and when night came they were hurried off to bed with never a kiss or prayer. Though living within the sound of three church bells, this mother never attended Divine worship or her children the Sabbath-school, because she said they "could not afford to dress in style, and they should not go to be made fun of." Her house was her God, and for its decoration she spent every dollar she could get; and to keep it with exquisite nicety, she eschewed real comfort and innocent enjoyment. And in this house the old picture of the man with the muck rake loomed up and spread out on the walls and hid from my view the bright pictures and pretty ornaments hanging there.

I know a young lady who has a passion for fancy work. Every new craze that comes along is rapturously embraced by her, and her home is literally crowded with articles of every description and material. Her money and her time are spent in the manufacture of the things "which perish in the using," while the riches of science, of music, and of classic lore are within her easy reach. In the pursuit of her almost useless enjoyments she sacrifices intellect, health, and eyesight, while the mother performs the arduous household duties alone and unaided. And as I stand and look around upon the ornaments of which she is so proud, I cannot help again seeing the man with the muck rake scraping the ground while above him bends the bright angel holding out the jeweled crown. LIZZIE CLARE.

REAL LIFE.

I THINK it is George Eliot who says: "The real heroines of this life are those who do every day duties uncomplainingly." This is well, but I do not believe that there is a woman exists having a soul to comprehend larger and more beautiful things than such as compose the common every day duties, who does not grow weary, very weary, at times. Then the present needs and cares come kindly to her rescue. Dear ones need her so much, she must be ready to satisfy their longings with love, as well as to have ready the things requisite for their physical needs.

Right here let me say to husbands, brothers, and sons all over this land, I pray you, do not fail of returning this great love by constantly uttering words of love and appreciation, followed by the actions which naturally arise from this condition of mind.

Do not, through thoughtlessness, make her feel that:

"You think, perhaps, I should be all content
To know so well the loving place I hold
Within your life, and so you do not dream
How much I long to hear the story told.
I weary, sometimes, of the rugged way;
But should you say, 'through thee my life is sweet,'
The dreariest desert that our path could cross
Would suddenly grow green beneath my feet."

Think of the courting days! Tenfold sweeter now would be your caresses amidst the hard work and care she so willingly accepted, than they were when young, bright and beloved in the home of her childhood she gave up all for a lifetime to be passed by your side.

Speak never slightingly of those she loved in her girlhood's home—the parents now lying forever lost to her mortal view, the brother, the sister; to her they were perfect, though you, perhaps, may have distinctly seen their defects. But never mind, do not destroy her tender memories of them, for love for her own will make her a better wife and mother; the truest friend and charitable neighbor. She may have many faults, this wife or mother, but so have we all—you among the rest. Try to give her the love which is her life, and which in herself is deathless as the stars. The only thing divine, perhaps, which earth has yet known or can bestow, is love. ETTA.

THE TWO SCHOOLMATES.

LAURA PRESTON left the Young Ladies Seminary wearing the highest honors, but her success won little sympathy from "the dear 500 friends" which every school girl is supposed to possess. She received the gold medal with a ball-room grace and sweep of her rustling gown, and a covert smile passed around the circle of those who knew her best. When all was over the congratulations were few and formal, while all flocked around their darling Dulcie Russell, who had only won a book of poems, yet they could not do enough to show their love and pleasure at her success. Dulcie's dress was the simplest white, with a soft ruching at the throat and wrists, and no ornaments but half blown roses, which day scholars brought in profusion. Her arms could hardly hold the wealth of bouquets and flower baskets which the ushers handed up, at the close of her essay. And they were more true love offerings than is common on such occasions. A girl that is truly lovable, will hardly fail of winning love.

"If anyone wishes to quarrel with Dulcie, she will have to do it all herself" the girls used to say.

In all the years she spent at school, I think no one could remember a single unkind speech of hers, or one careless word that could wound another's feelings. But oh, such a comforter as she could be for lonesome homesick girls, or girls whose sensitive spirits had been wounded by unkindness.

Dulcie seemed to be everything that Laura was not. Laura's sharp, sarcastic tongue alienated all who were afflicted by it. She delighted in retailing ill news. If she knew some hateful thing about another she took a good opportunity of alluding to it in the presence of several others, and then watching keenly how her victim "took it." No pleasure seemed so great as uttering spiteful words. It was much as if one made it the business of life to go about and gather burs from burdock weeds and stick them on people as they passed by. It would seem a strange business to follow, but it would be innocent amusement compared with stinging the spirit with words that are like nettles. Such a disposition brings on old age with its crow-feet and shrill tones very early. While Dulcie will seem young and light-hearted at seventy. Her admirers will flock around her down to old age; but Laura, if she lives to that period, will be sourly, snapping at the ingratitude and want of attention shown by the youth of the day, her own immediate friends in particular. Wealth only will secure for her toleration, though it can never win for her affection. OLIVE.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOUSEKEEPING IN CALIFORNIA.—VII.

MARY WAGER-FISHER.

UNLESS one keeps up a brisk fire all the day long in the kitchen, an oil stove is not only a great convenience, but a great economy. Indeed, in all of our own small housekeeping on this coast, we find it indispensable, and our last investment cost but a dollar and a half, and is altogether satisfactory. I have the bad habit of "cooking all over the house"—toasting bread over the parlor grate—a capital place—heating milk on the dining-room stove, and cooking a steak and boiling coffee on the oil furnace, as the fire in the kitchen usually expires soon after breakfast.

Living for so long a time, too, in towns where the water is brought into the house and is to be had by the turning of a faucet, I have come to the conclusion that for any woman to be obliged to pump all the water required for the house and kitchen is utterly atrocious, and that in building a house and establishing a home it is just as essential to provide means for supplying the menage with a flow of water, by some one of the powers that be, as it is to have mowing machines, sewing machines (a great deal more so, indeed!), horse pitch-forks and horses and carts. Of course, there are a great many things in the world of which we have no need, partly because we haven't been accustomed to them; and so a vast army of women do not "miss" running water and a good drain sink, because all their lives they have been used to a pump in a well, a water pail and a dipper. But the enormous tax on strength goes on—the body-wrenching business of operating a pump and lifting the filled water bucket. Much of the difficulty could be obviated, where dwellings are high and there is expanse of roof to fill eaves, if a tank were constructed sufficiently high, fed by the eaves and led into the kitchen by a pipe. The rain tank is usually put below the ground and called a cistern, and the water has to be pumped. The elevated tank would be beset with some difficulties—particularly in Winter where blizzards prevail—but I do not see, with intelligent management, why it could not be made a very efficient and satisfactory adjunct of the kitchen. If any woman has such an arrangement she might serve the cause of woman-saving by telling about it in the RURAL. It sometimes happens that farm houses are so situated that water could be brought from an adjacent hill, and, of course, in the good time coming, electrical power will be so well understood and so cheap, that everything will be done for us by the touch of a spring, and windmills and steam engines that now vex our souls by their "cranks" will vex us no more; and if we all were to live a thousand years, patience to wait would be no great virtue.

One day a lady said to me, "How do you eat your tomales?" (pronounced to-mal-es.) I stared at her in ignorance and replied "I don't eat them; what are they?" "A Mexican dish—three for 25 cents. Shall I send the man around to you?" So it came about that one evening, about seven o'clock, there was a ring at the door, and there appeared a handsome black-eyed young man, with a wooden pail in his hand, which contained coarse brown wrapping paper in a confused condition. I heard him say "Tomales!" and I sang out from the parlor, where I was reading, "Yes! this is the place. Come in here!" Then he began to fumble around in the bucket, and presently fished out from the sea of paper, three packages tied up in corn husks—still warm, like a cooled-off poultice. A volley of questions succeeded, and he informed me that the tomales were made in San Francisco, by Mexican women, and were distributed, piping hot, both in that city and Oakland. They could be reheated best by steaming them. I quickly cut from one the husk strings, one at each end, and one in the middle. The "thing" was about six inches long and as large around as an unhusked ear of corn—and I then took off a husk, a very wide one I thought, and it measured 11 inches in width. "The husks are all parboiled" explained the man. Then on the next husk, I discovered something that looked like a husk also, and I said, "this is husk too, and goes into the fire." "No, madame, this is the beginning of the tomale"—it was spread on the husk like a plaster. "And what is it made of?" "Of lard and corn meal; cooked together"—so I proceeded taking off husk after husk with its layer of lard and meal, meantime I asked what was inside? "Oh, inside there are olives and raisins and Chili pepper and chicken mice." "Mice!" "Mince do you call it? Mince of chicken—sometimes of pork. This is chicken!" Finally the inside wad was reached—minced chicken meat mixed with the ingredients he had named—and the mercy only knows what else. I began at once to eat, the "laddie" looking on and wanting some—but refused because it was too near his bed hour—and I had strong suspicions that it was a mixture to give a hyena indigestion. Anaximander declined with thanks—so that two tomales were laid away to be steamed hot for breakfast. Upon the whole I rather liked it—or thought I might with practice become fond of tomale. The young man said he was a Spaniard from Spain—not a Mexican—and told us how many chickens were daily used at the tomale factory; that the French and Germans did not care for them, and that Mexicans and Americans formed the chief patrons. He stood by, until I had swallowed the last of the tomale, and hoped that we would let him know if we wanted him to bring any more. The Chili pepper made me very thirsty, and I went to sleep to dream dreams of being a participant in five or six enviously ingenious murders, and of being murdered myself, finally, after which I awoke. I concluded, that so far as I was concerned, the tomale man need not call again.

The steamed tomales for breakfast were nibbled at gingerly by the uninitiated members of the family. The "laddie" liked the raisins and the chicken mince, while Anaximander thought he might eat them sooner than starve! As a mechanical device, the tomale is a success—the oddity of the corn husks, and the successive layers encircling the middle roll. The mush of lard and meal spread between the husks, is compressed into a wafer-like cake, and bears the print of the husk. Beyond cheapness and convenience, and its peculiar character as a wrapper I do not know that

anything is gained by its use. But probably a Mexican detects a certain husky flavor that the unenthusiastic do not discover.

WHAT TO WEAR.

Black stockings for children are still fashionable.

Plain, round dress waists of wash goods are very pretty and dressy cut out back and front, either square or V-shape,and filled in with embroidery.

A waist with a yoke back is not becoming to a round-shouldered woman or child.

Ribbon trimmings are very popular for summer dresses,

We regret that Dame Fashion again favors the wearing of jewelry upon ordinary occasions.

A CHAPTER ON SWEETS.

MANY of the best judges esteem the strawberry the most delicious, as well as the most healthful and nutritious of the whole family of fruits. I have compounded with great care the reliable recipes given below:

PRESERVED STRAWBERRIES.

Weigh your fruit, and for every pound of berries allow three-quarters of a pound of sugar. Use a granite or porcelain sauce-pan, and for every four pounds of sugar add a quart of water and boil until the sirup thickens to the consistency of stout molasses. The universal usage of a pound for a pound makes the preserves needlessly sweet, and with the lesser quantity the native flavor of the berry is more pronounced. With a large spoon lift and pour the sirup over the berries until they are thoroughly saturated, but do it carefully so as not to bruise the berries. Place over the fire until the sirup begins to boil, and at the exact stage of the boiliug point remove the scum, pour all into an earthern pan and set away till next day. The next day place them again on the fire, and as soon as the boiling point is again reached set them aside once more for several hours. Again place them on the fire until they are very hot, but do not let them boil. Lift out the berries with a skimmer and lay them on a large, flat dish. Boil the sirup 15 minutes, make all hot once more and seal up in glass jars or tumblers.

STRAWBERRY JAM.

Weigh eight pounds of berries and rub and press them through a hair sieve; add sugar in the same proportion as that given above, place over the fire and with a wooden spatula stir constantly for half an hour after it begins to boil. It is now ready to seal up. If you can make this late in the season and can add to this quantity a pint of red currant juice, the flavor will be exquisite. In this case you must boil the juice with the sugar for half an hour, then add the berries and boil for half an hour longer.

TOMATO FIGS.

It is hard to find a more beautiful preserve or one more delicious than the above. Take eight pounds of the small, yellow tomatoes, pour boiling water over them to take the skins off. It is better to plunge them a few at a time into boiling water and take them out and peel them quickly, so that they may not become softened. Weigh out six pounds of sugar and put both in layers in a large earthern dish, to stand over-night. In the morning drain off the sirup and boil it until no more scum rises. Put in the tomatoes with the juice of four lemons and four ounces of ginger root, and boil slowly for half an hour. Take out the tomatoes with a perforated skimmer; let them remain in the sun for several hours to harden; boil the sirup down until it thickens, return the tomatoes until they get hot through and seal up.

CANDIED FRUITS.

These are so easily made at home that there is no necessity of paying a dollar a pound for them. Make a sirup of a pound of sugar and a cupful of water and boil until it thickens, put in any kind of fruit and boil until it is tender. Let them remain two days in the sirup, take out, drain and sprinkle sugar over each piece separately. Dry slowly in the sun or oven with a very moderate heat.

Other recipes will be given later in the season. PALMETTO.

EXTRACT FROM A PRIVATE LETTER.

HOPING you care for it, I mail you a bit of long moss—Tillandsia usneoides—from the grand old live oak at Hibernia, Florida, which spreads its shade over a diameter of 140 feet, one branch extending horizontally, 75 feet; Each branch looks like the trunk of an ordinary tree, and this giant is so well proportioned, that one does not realize its size unless standing under it.

Florida this Winter with her poor sick orange trees, as bare of leaves as our oaks, had a desolate look, but "Nature, the dear old nurse," knew nothing less than the rainy days she sent in late Winter and early Spring would bring her beauty trees safely through. When I left in the middle of April, in Southern Florida, I believe they were all blossoming nicely, but farther north, there were plenty of leaves growing slowly, and but few blossoms, many of which were falling off—doubtless, doing a kindness to the trees. The noble St. John, one-and-three-quarter mile wide at Hibernia, was as beautiful as ever, while the quiet, home-like air and contentment of guests, some of whom used to go there "befo' the wah" made the place a truly pleasant spot in which to seek health and rest. MRS. M. G. W.

SPRING GREENS: COWSLIPS AND DANDELIONS.

AFTER they are gathered, pick them over carefully so that no grass or decayed leaves will remain among them, then wash carefully in two or three waters. Put them over the fire and let them come to a boil, and then drain them in a colander. Cover them with fresh water, return to the fire and boil an hour. Slices of boiled pork may be boiled with them to flavor them if desired; or when done, they may be drained and then seasoned with salt and butter, and eaten with vinegar. Horse-radish leaves in their season may be prepared in the same way, also rough-leaved mustard. MRS. B. C. D.

A FOURTEEN-YEAR-OLD GIRL'S EXPERIENCE IN BUTTER-MAKING.

MOTHER and I have been making butter for four years at 25 cents a pound for regular customers, and have never had any fault found, except that we could not furnish enough to suit them during some parts of the year. We have a milk-house one rod from the house, and whitewash it inside every Spring. We keep the milk, churn, cream and butter in it, and use the deep-setting cans in Summer and pans in the house in Winter, churning with a barrel churn the year around. We are very particular when weighing the butter, and allow one ounce of salt to each pound of butter. The cream can is kept behind the sitting-room stove in the Winter. Salt is added once, and it is stirred thoroughly every day. Have the temperature of the cream 60 degrees in Summer and 62 degrees in Winter. We think the butter should not come in less time than a half hour—it is then hard and yellow. We salt and work the butter just enough to work in the salt, and put it away till the next day, when it is made into rolls and set away until market day. We never think of washing it, and when it is in rolls it weighs just the same as when taken out of the churn. BECKY E.

KEROSENE IN WASHING.

A CORRESPONDENT asks if any of our readers have used kerosene in washing. We have never heard of it being used for cleansing purposes, but we have known of a few drops being added to boiled starch to prevent it sticking. This may be what our correspondent refers to.

STRAWBERRY ICE-CREAM.

Make a boiled custard of one quart of milk, one teaspoonful of corn starch, two eggs, one cup of sugar. Press three pints of strawberries, or as many more as you please, through a sieve. Make the juice very sweet, add it with one quart of cream, one cup of sugar, the whites of two eggs, well whipped, to the custard, just as you put it into the freezer. This makes one gallon of cream.

WHITE CAKE.

Whites of six eggs, scant three-fourths of a cup of butter, one-and-one-fourth cup of pulverized sugar, two cups of flour, juice of half a lemon, one-fourth of a teaspoonful soda. Mix soda with flour. Beat the butter to a light cream, and add the flour to it, stirring it in gradually with the fingers until a smooth paste. Beat the whites to a stiff froth, and mix with them the sugar; now stir the eggs and sugar gradually into the flour and butter, adding also the lemon juice. Bake in a moderate oven. Frost while hot with one white of egg and a heaping teacupful of pulverized sugar. Beat egg till slightly foaming and add sugar. This cake must be put together exactly as directed.

A friend molds her veal croquettes into the form of pears, as a change from the old way. M.

Debility

Languor, and Loss of Appetite, are cured by the use of Ayer's Sarsaparilla. It removes that terrible sense of *Constant Weariness*, from which so many suffer, gives tone and vigor to the stomach, and restores health and strength more surely and speedily than any other medicine.

Three years ago I suffered from Debility and Loss of Appetite, the result of Liver Disease. After having tried various remedies, and consulted several physicians, without benefit, I was induced to take Ayer's Sarsaparilla. The first bottle produced a marked change, and the second and third accomplished so much that I felt like a new man. I have, since that time, taken about one bottle every year, and had no recurrence of the trouble.—William E. Way, East Lempster, N. H.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

DAIRY THERMOMETERS!

Every farmer should have one. Sent safely by mail for 50c

Send for Catalogue of Thermometers, Lactometers, Creamometers, and Thermometers for Incubators.

W. M. McALLISTER, Optician.
720 CHESTNUT STREET, PHILADELPHIA, PA.

AN ACHING sensation midway down the back and at the right of the spinal column indicates a deranged condition of the liver which can be rectified by the use of that great specific, Warner's safe cure.

SALT. ONONDAGA F. F. SALT. SOLE MANUFACTURERS, American Dairy Salt Co. (Limited.)

Chemically purified and WARRANTED pure as any in the market. Used by a great majority of the Dairymen of the country. Unexcelled for Butter, Cheese, the Table, and all Culinary purposes. Took Medal at Centennial "for purity and high degree of excellence." Dairy goods salted with it took first premiums at New Orlean's World's Fair, N. Y. International Fair; Milwaukee Exposition, and always wins when there is fair competition. It is American, and *cheaper and better* than any foreign salt. Try it. Address

J. W BARKER, *Secretary*,
Syracuse, N. Y.

A NEW BUTTER PRESERVATIVE.

KELLOGG'S ROYAL SALT.

Positively Prevents Butter from ever becoming Rancid.

Endorsed by George B. Douglas, Esq., Ex-President Mercantile Exchange; Putnam Conklin, Esq., Manager Thurber, Whyland & Co's Butter Department, New York City; Col. Wm. Crozier, Northport, L. I., N. Y., and others. Send for Circular.

Another Victory at Gettysburg.

GETTYSBURG, Pa., Nov. 20, 1885.—Two years ago, I became a confirmed invalid. My friends thought I was far gone with consumption. I grew worse under the treatment of physicians, and at last resolved to try Warner's safe cure. In two weeks, I was like a new creature. In four weeks, was able to assume my household duties. At this writing, perfectly well. I believe Warner's safe cure will cure 99-100 of all suffering people, so I convince all suffering people of its merits.—MRS. E. J. WOLF, Wife of Rev. Theodore Wolf, L L, D., Editor *Lutheran Quarterly*.

News of the Week.

HOME NEWS.

SATURDAY, May 22, 1886.

THERE are now 77 Mormons in the penitentiary for polygamy and "unlawful cohabitation" within the last 18 months. Of these 35 are English, 25 American, 10 Scotch, 2 Swedish, 2 Irish and 1 each from Norway, Denmark and South Wales.....A Martinsville (Va.) affray, in which nine "leading citizens" were wounded, but none fatally, all on account of the publication of scurrilous posters, is a melancholy illustration of the decline of Southern marksmanship..... Marshalltown, Ia., has gone crazy with joy for having secured, from 18 jealous rivals, the $100,000 soldiers' home the Legislature has voted to build....."Jachne, the first of the "boodle" aldermen of this city brought to trial, has been convicted of accepting $20,000 as a bribe for voting for Jake Sharp's Broadway car line, and sentenced to nine years and 10 months imprisonment. Public opinion was too strong to allow any judge to fool with justice by letting him out on bail, pending an appeal. Went to Sing-Sing and stripes yesterday morning.....There's doubt at Washington of the passage of the Chinese indemnity bill because "there are no votes in it."..... .....There's a good chance of passing the Morrow bill excluding the Chinamen. Shouldn't we pay for those killed, before shutting out their countrymen?.....The Ohio Legislature has adjourned *sine die*. The Democratic Senators didn't return. Thurman is blamed for advising them to leave the State. A bill was passed redistricting the State for Congressional elections, restoring the boundaries of 1882, which were altered by the Democratic Legislature. The new Dow Liquor Law is the same as the old Scott Law, except that it is free from the objections on which the Supreme Court declared the Scott law unconstitutional. Liquor dealers say they will pay the licences without contest..... The New York Legislature adjourned Thursday. The Senate failed to confirm the nomination of E. A. Durent, Republican grain merchant of Albany, as Railroad Commissioner to succeed John O'Donnell, Democrat..... Governor Hill has signed a bill forbidding the employment of children under 14 in factories; and another providing for local boards of arbitration..South Dakota is mad that Congress has refused to admit it as a State, and Gen. Campbell, the leader, proposes to go ahead and organize a State Government anyhow. Others say this is Jeff Davis's doctrine of State rights. .....A very lively contest between Gen. Gordon and Maj. Bacon for the Governorship of Ga. All minor candidates have dropped out to witness or take part in the fight..... ....The Massachusetts senate has passed by a vote of 23 to 7, a bill raising the tax of telephone companies from $30,000 to $250,000..... The House, Monday, agreed, 196 yeas to 18 nays, to set apart June 3 (and as many subsequent days as may be needed), for consideration of bills relating to labor. This question is assuming vast importance in Congress, and the Committee on Labor, first established in this Congress, is becoming one of the most important in it, membership being eagerly sought by Congressmen as likely to make them "solid" with the labor vote.....By the treaty of 1778 France pledged herself to secure our independence, and we undertook to guarantee her American possessions and to give her special commercial privileges. A good deal of trouble existed between the two countries between 1793 and 1800, and a number of vessels belonging to each were seized by the other, especially by France. In 1800 the United States agreed by treaty to abandon all claims for compensation for them if released from all obligations of the treaty of 1778. Those who had lost by the seizures then claimed compensation from our government on the ground that it had sacrificed the rights of its individual citizens to secure a great national advantage. The matter has been before Congress ever since under the name of "French Spoliation Claims." Floods of talk and volumes of writing about it! Under President Arthur it was referred to the Court of Claims, which last Monday declared that the United States is legally responsible. Original claimants all long ago dead; children of most also. Claims now mostly in the hands of strangers. Lawyers will be the heaviest gainers. Several million dollars involved. A famous case. .....Some talk about starting the Keely motor—nothing but promises from Keely and some profanity from investors .. ..M. De Lesseps wanted the French Government to authorize a lottery for the purpose of raising a vast sum to build the Panama Canal. As so much French money is already in the enterprise, and no government could stand if it authorized further investments, should the undertaking collapse, as predicted by Americans, it appointed an agent, M. Rousseau, to investigate the matter. After close inspection of the works at Panama, he made to his Government, on Thursday, a report. He denies the correctness of the Canal Company's statements respecting its facilities for construction, the time when the canal will be completed and the amount of money still required to accomplish the work. M. Baihaut, the Minister of Public Works, will, therefore, inform M. De Lesseps and his fellow directors that they must reply to M. Rousseau's report, as the Government cannot authorize the proposed issue of lottery bonds until the position of the company is made clear. Our people on the Pacific Coast are deeply interested in this matter.....Prof. Timothy Dwight was unanimously chosen president of Yale College, Thursday.....Col. J. D. Folsom, grandfather of Miss Frances F., died Thursday morning, at Folsomdale, 25 miles from Buffalo, N. Y., after an illness of several years, aged 75. Was thought to be worth from $500,000 to $750,000; "Frankie" will get some.....President Cleveland has bought a $25,000 homestead near Washington. ....The House of Representatives, on Thursday, by a vote of 178 to 80, defeated the Senate amendment to the Post Office Bill, giving $800,000 as a subsidy to American vessels for carrying the mails..... ....Another American fishing vessel has been seized by the Canadians for buying bait. Bills are being rushed through Congress to deny commercial privileges to vessels of all countries, which, like Canada, deny them to our vessels. The treaty of 1818, on which Canadian action is based, says American fishing vessels may enter Canadian ports to buy "wood and water, and nothing else." Americans say this provison has been nullified since, and that American fishers having official permits to trade, can buy anything like other American vessels. The first vessel seized had no such "permit;" the second had. Canadians are angry because the papers of the Mother Country are belittling the "difficulty"—a tempest in a tea cup. American vessels are arming to resist capture; for Canadian bait and ice they will have, as otherwise their season will be ruined, as they can't lose time to go home for supplies. Numerous Canadian fishing vessels are buying seines, bait, ice, etc., in American ports..... The Curtin labor-trouble investigating Committee has returned from the Southwest to Washington—expense of junket, a trifle of about $3,000.....Rosecrans has, after all, been confirmed as Register of the Treasury, so has Mrs. Tompkins as Postmistress at Louisville, and D. T. Houser as Governor of Montana..... ..Bradstreet's reports that though 250,000 men have been on strike in this country at one time or another since April 24, there were at no one time more than 125,000 employés out, and that this number fell to 80,000 between May 12 and May 17, and to about 48,000 by May 20. The heaviest losses by the strike were from delayed or canceled contracts, and the building trades suffered most. The total loss on building contracts in 10 cities is estimated at $20,400,000. These losses have been most thoroughly reported and are represented by most of the figures in the last column of the following table of the losses thus far reported:

	Wages	*Current business.*	*New business stopped.*
New York City	$300,000	$300,000	$2,000,000
Philadelphia	60,000	50,000	5,000,000
Smaller Pa. cities	70,000	50,000	——
Detroit, Mich.	97,000	25,000	850,000
Cincinnati	375,000	300,000	1,000,000
Milwaukee	466,000	200,000	4,000,000
New England cities	257,000	——	6,000,000
St. Louis	75,000	——	——
Troy, N. Y	75,000	——	150,000
Washington, D. C.	54,000	——	2,000,000
Indianapolis	2,000	——	——
Pittsburgh	30,000	75,000	300,000
Louisville, Ky	23,000	5,000	500,000
Coal strikes	200,000	500,000	Indeterm'te
Chicago	700,000	700,000	3,000,000
Totals	$2,802,000	$2,105,000	$24,800,000
Grand total			$29,707,000

Remember these figures do not include the enormous aggregate of losses by strikes in smaller places and along railroad lines; nor the losses incurred by farmers and the general public by interruption in buying and marketing goods, etc., etc. The sum total of all the losses caused to the country by the late striking craze must be considerably over $50,000,000. Most of the big strikes have collapsed. There is a good deal of turbulence still in Chicago, especially among the hands at the stockyard and lumber handlers. Some more rioting at Milwaukee; a disorderly mob insisted on wrecking a factory guarded by the militia, although sternly warned not to advance. A volley dispersed the crowd, killed four and wounded a number.....In Troy, New York, 10,000 "girl" operatives in laundries and shirt factories have been thrown out of employment by a "lockout" by the employers. The employés of one man struck, and all the other "bosses" closed to support him. The eight-hour movement is already a failure. Some of those who granted the "short day" have already gone back to 10 hours, often with the consent, or at the request, of the hands. The others are sure to do so ere long.....

FOREIGN NEWS.

SATURDAY, May 22, 1886.

ACROSS the Atlantic the prospects for the passage of Gladstone's Home Rule Bill have brightened during the week. He has secured the Queen's consent to dissolve Parliament and hold a new election in case the measure is defeated at the second reading. The Liberal "machine," organized chiefly by Chamberlain, has turned against him in all parts of England, and now supports Gladstone. The Scotch Liberals, however, are still bitterly opposed to the bill. An election is always a heavy expense to candidates, who if successful, get no pay; many of the recalcitrant Liberal members are sure to be defeated as the Irish vote in the various constituencies will be solid against them, and they can expect little Liberal support; while the Conservatives will run candidates of their own wherever there's a chance of electing them. In other places they will support the "Union Liberals." The hesitating Liberals have finally decided to join the Grand Old Man. The Ulster Orangemen are still talking war in case Home Rule is granted; the Catholics say there are as many Catholics as Protestants in Ulster, and that the latter could be easily wiped out if they rebelled.. .....The Marquis of Salisbury, the Conservative leader, says discontented Irishmen should emigrate. The "No Popery" cry has been started in England for political effect.....A Home Rule cry has just been started in British India, where the prominent natives have long been chafing at their almost complete exclusion from the government of the country. English a little startled: if five million Irish Home Rulers give so much trouble close at hand; what a storm might be raised by 250 000,000 Hindoo Home Rulers away in the East. Caste, ignorance, and centuries of abject subjection are likely to confine the agitation within narrow limits, however.....England and Turkey now jointly occupy Egypt, the Turks being sent down to the southern border, where they have lately had a "brush" with the followers of the new Mahdi, whom they defeated, ornamenting the gates of their quarters with the heads of the slain..... The Greek Chamber of Deputies, just assembled, have rejected the nominee of the late Premier for President of the Chamber. M. Tricoupis, a former Premier, has formed a new ministry, whose policy will be peace. Yesterday, however, there was heavy firing between Greek and Turk outposts at the frontier, and the order to lessen the army has been countermanded, and troops are again hurrying to the frontier. No blood was shed at the outposts, however. The Czar, now in the Crimea, the other day issued a "remarkable manifesto" to the Black Sea fleet, reminding the men of their bravery in the last Crimean war, with England, France, Italy and Turkey, in 1853, and bespeaking a like courage in any future contest. That and the new Greek embroglio disturb the European money markets. Peace, however, is hardly likely to be disturbed at present . .. . Queen Christina of Spain last Monday gave birth to a boy baby, son of unstable Alphonso, who died last November. Little five-year-old Mercedes, who has hitherto been queen, will be so no longer, as a woman can succeed to the throne only in the absence of male heirs. Much rejoicing throughout Spain, especially at Madrid. Some think a male heir will give more stability to the throne than a female; others say Mercedes could have married the son of Don Carlos, who claims to be the legitimate sovereign, and thus discordant claims would be quieted. Don Carlos has lately inherited $10,000,000 from the late Countess De Chambord, which adds much to his means of asserting his claims..... De Lesseps's engineers are preparing an answer to Rousseau's statements about the Panama Canal. De L. insists it will be finished in 1889, and that he can get plenty money elsewhere if the French Government refuses him permission to issue lottery bonds France lately wished to contract a loan, and small investors offered 35 times the amount wanted. .....Minister Pendleton on returning from a great review of troops at Berlin, fell senseless to the ground when told of his wife's death here. He is "thoroughly broken down."

AGRICULTURAL NEWS.

SATURDAY, May, 22, 1886.

REPORTS from different parts of the dairy States say that several cheese factories intend to become creameries, as cheese has been so low of late and butter-making will receive a boom, if Congress should tax oleomargarine. The makers of this stuff who, at a late meeting at Pittsburg, made arrangements to raise an enormous sum to be placed where it would "do the most good" for their interests, are doing their "level best" to defeat hostile legislation. They have a big lobby at Washington; a "literary bureau" in this city, which is flooding the country with pamphlets in praise of oleo and running down poor butter, and they are getting cliques in the Boards of Trade of various cities to pass "resolutions" in favor of bogus butter. Armour got a majority of the directors of the Chicago Board of Trade to do so in the name of the Board, but the members protest, and say that such a resolution would be overwhelmingly defeated if presented in that body. Meanwhile farmers are pouring into Congress a multitude of letters favoring anti-oleo legislation.. ....The Ohio legislature proposed to squelch the Bohemian Oat swindlers, by means of a bill which provided that any rascal connected with the swindle should be treated to a free bed in the penitentiary for three years, or to pay a fine of $100 to $500 or both, at the discretion of the court..... To prevent the spread of Texas fever, Texas and Colorado representative rangemen have signed an agreement by which cattle from Northwestern Texas, a region supposed to be free from fever, are allowed to use the Dallas trail, leading through the Cherokee Strip and part of the Texas Panhandle, without restriction; while cattle from Central Texas are to be quarantined 60 days and from Southeastern Texas 75 days before entering the Cherokee Strip. All cattle are to be confined strictly to the trail, and to pass through the chutes built by the local ranchmen, so that local stock may be driven across the trail without risk of contagion.....Colorado live stock journals are pitching into Gov. Eaton for relaxing quarantine restrictions against the possible importation of contagious pleuro-pneumonia from the East.....Residents of foreign countries now own over 30,000,000 acres of land in the West, mostly for grazing purposes, though a large share is occupied by tenants. Moreover, they hold a number of smaller possessions in the East, and some very large tracts in the South, especially in Texas, Louisiana, and Florida....The River Platte (S. A.) is reported to have more than doubled its wool clip in the last 20 years, and to represent now a total probably equal to the entire Australian clip....In the nine months ending April 1, 1886, a total of 99,872,721 pounds of wool were imported, against 49,080,357 pounds in the same time a year before.....The aggregate receipts of wool at Boston since January 1, 1886, have been 78,616 bales domestic, 48,980 bales foreign, against 104,034 bales domestic and 19,472 bales foreign for the corresponding period of 1885. This is a decrease of 25,418 bales domestic and an increase of 29,508 bales foreign..... Exporters of live cattle are said to be losing money.....The export trade in apples was, for once, unprofitable the past season..... The world's wheat crop of 1885 is placed by the Department of Agriculture at 2,098,286,759 bushels.....Considerable reduction, Monday, in Eastern railroad rates on flour from Minneapolis and St. Paul to seaboard, forced on roads by competition on the lakes and canals. Rates from St. Louis too likely to be reduced to save some traffic.....A report circulated here that the water used for washing down the carcasses in Swift's and Armour's slaughter-houses in Chicago is dirty Chicago River water, is contradicted by the Chicago Health authorities, who say it is taken direct with a hose from an artesian well sunk on the premises of each, and is quite pure.....

Changing the Key-Note.

"A cheerful spirit gets on quick;
A grumbler in the mud will stick!"

Well, that's so. But suppose you are stuck in the mud by ill health, how are you going to get out? Suppose malaria or nervous depression or physical prostration have put you into so deep a rut that you feel it an impossibility to be cheerful? There are various means reported, but the one which has in recent years lifted the largest number of sick people out of the mire and placed them on solid ground of good health and cheerful, joyous life, is the Compound Oxygen treatment of Drs. STARKEY & PALEN, 1529 Arch Street, Philadelphia, who will mail to you their little book of nearly two hundred pages free on application. —*Adv.*

Crops & Markets.

SATURDAY, May 22, 1886.

The outlook for breadstuffs abroad begins to look a little more in favor of the bulls, as lack of rain and continued cold days and nights in portions of the United Kingdom and on the continent have notably delayed the growing wheat plant. These advices come from all sources by cable, and of late by mail. There still appears to be some doubt as to the supplies prior to new-crop receipts being sufficient to hold prices down to late levels.

The Mark Lane Express, in its review of the British grain trade during the past week, says: The floods and snow storms during the past

week have injured crops. The wheat market has not materially altered. Sellers were firm during the week, and millers were apathetic. The sales of English wheat for the week were 61,172 quarters at 31s 11d per quarter, against 46,467 quarters at 37s 5d for the corresponding week last year. Flour was more scarce, and values have improved. Foreign wheats were weaker, owing to the larger stocks, the large quantity afloat, the acute position of the American trade, and the outlook for the next crop of the world. There is no prospect at present of an improvement. English wheats were difficult to sell. For foreign there was no inquiry; American red was rather cheaper; good America was flat. Maize, although scarce, was 3d cheaper. Other grains were dull.

Exports of wheat from Australia to Great Britain for four months, January to April inclusive, were 48,000 quarters this year, against 796,000 last year. Flour exports were 1,100 tons, against 2,000 tons last year.

There are reports of heavy ruins which are said to have "lessened somewhat the former excellent outlook for spring wheat" in Minnesota, Dakota, Wisconsin and Nebraska. This rainfall is also stated to have caused some injury to the winter wheat in Wisconsin, Michigan, Ohio and Indiana, "where some of the fields were beginning to head out." But no serious damage has been reported. In Kansas, where but a "40-per-cent. crop" was to be harvested, "some improvement is noted" in the winter wheat outlook within 30 days, and in Michigan within a fortnight past.

At home the past week has been signalized by the heaviest week's decline in the visible supply of wheat on this crop, over 2,330,000 bushels, as compared with a decline of 1,900,000 bushels, the heaviest decline in any previous week. This is due greatly to the heavy foreign exports, as the low prices secured large investments. In spite of the decrease in the visible supply, however, prices have fallen everywhere.

Corn dull and generally lower. A decline of only 800,000 bushels in the visible supply. Oats have been irregular. Decrease in visible supply nearly 1,500,000 bushels. The decline in grain, as usual, produced a decline in hog products. Large operators predict that pork in July will sell for $7 a barrel in Chicago.

Butter lower on account of heavy accumulating stock. Cheese steady.

Old potatoes are growing scarce and higher. Apples too have begun to go up. It would seem that the low prices last Fall led many to bestow little thought on keeping their apples, so that now it is likely there will be a good market for those that have been kept sound.

It is expected there will be a shortage of at least five per cent. in this year's wool clip. There will be a falling off in Ohio, Penn'a, W. Va., and heavy losses are reported from Western Kansas and Southern Colorado. In Michigan, Wyoming, and Montana flocks have wintered well. The general impression is that the shortage of the home clip and the heavy sales of woolens by manufacturers point to higher prices later on. Just now buyers are doing all they can to depress prices and to force moneyless farmers to part with their stock at low rates, but when they have secured the bulk of the clip they will be equally anxious to put up prices on the manufacturers. The great hindrances to high prices are the labor agitation and the unprecedentedly low price of Australian wool in England. Nearly 400,000 bales are to be sold in London on June 16, and the prices there will influence those here. It is likely, however, that it will pay to hold wool rather than sell it below the cost of production, which was largely done last year. The wool market has nowhere, so far as we can find out, opened lower than a year ago, and in some places it is higher; two cents higher at Salt Lake City.

A San Antonio, Texas dispatch says that the wool market there is quite alive. On the 13th inst. over 1,000 bags, or 200,000 pounds were sold. Nearly all of it is six months' growth. The sales were made on private terms, purchasers requesting the sellers not to disclose them, but enough was learned to show that the price paid was not less than 16 cents per pound, and that some of it went at 16½ cents. There are at least 3,000,000 pounds of wool on hand there, and this amount does not embrace a third of the crop of this Spring.

MARKETS BY TELEGRAPH.

SATURDAY, May 22, 1886.

DR. JOS. HAAS'

HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.

AS AN EVIDENCE OF FAITH

in my remedy I make the following offer:

1. I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.

1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.

2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.

Facts are Better than Assertions.

Please read the following testimony:

GIBSONTON P. O., PA., Feb. 2, 1885.

Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*

Yours very truly, WHITE & CO.

[N. B.—White & Co., since writing the above letter, have purchased $450 worth of the remedy.]

The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

JOS. HAAS, V. S.

Member of Indiana State Veterinary Med. Associat'n

INDIANAPOLIS, IND.

THOUSANDS OF PHYSICIANS all through the United States prescribe Warner's safe cure, in bottles of their own. You pay them $1.50 to $3.00 a visit; you can buy Warner's safe cure, sixteen ounce bottles, for $1.25. Do not be imposed upon.

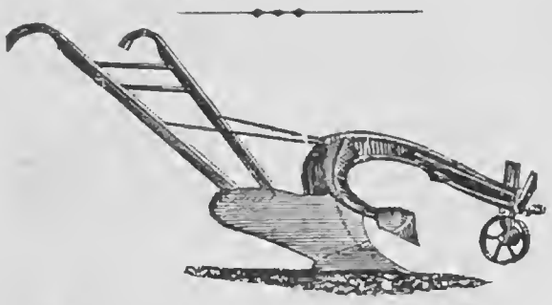
For the Young.

A PRIMITIVE CHURN.

COME listen now to the tale I tell,
  Ye men awhile from your labor turn,
Ye women rise for a moment now
  From the awful "bondage of the churn."
List to a tale that you will not find
  In book or in pamphlet old and rare,
A simple tale of a simple churn;
  Then list to a moral straight and fair.
A housewife placed, in the olden time,
  A can of cream on the kitchen floor
When over the meadow the sun sank low
  And blackness flooded the landscape o'er.
Then out of the swamp as the moon rose high,
  When the family all had gone to bed,
A bullfrog came with a hop and jump
  For a moonlight walk—and his footsteps led
Him straight to the kitchen door—'tis sad;
  But pushed along in a splendid dream,
He made one jump of an extra size
  And landed square in the can of cream.
Now most of us at a fate like this
  Would drop at once in a wild despair,
But bullfrogs come of a sterner stuff
  He struck out manfully then and there.
He kicked and kicked till the butter came
  In a solid ball with a golden hue,
And he perched himself, with a knowing wink,
  On his new made throne when his work was through.
You can read the moral without a stop;
  There are times when we sink in doubt and fear;
We must kick the cream of our trouble out
  And make the best of our lives appear.
The cream will rise from our work some day,
  And if our lives have been nobly spent,
We can churn from the memories sure to come,
  The golden butter of sweet content.



WE shall have quite a plow talk this week. show a picture of the plow just above, so that you all can see what you are working for. The following letter was received by D. Woodward & Son, of Clinton, Mich., who offered the plow:

D. WOODWARD & SON:

DEAR SIRS:—I saw the prize offered in the RURAL for the boys that could make out the most words out of "Clinton Chilled Plow." Now I have no brothers under 16 years of age, and I am a girl under 13, and would like to try and get a plow for my father, who is a farmer. Please write and let me know if I can try.

MINNIE C. ANSLEY,

As soon as this letter came, Woodward & Son wrote me that they would offer another plow to the girl that could make up the most words. So now there are two plows to be won—one goes to the boy with the longest list of words, and the other to the girl who finds more words than any other girl can find. This is the best way for us to settle it. I am glad the girls are to have their rights. I shall give you one more week. All lists will be counted that are sent in before June 8th.

LISTS have already been received from Sophy Stratton, Howard Mintle, Isaac D. Davis, Flora J. Erskine, Merry C. Cassel, Johnny G. Veldhuis, Maud Raymond, Ralph and Laura Swartz. If any of the Cousins should send in their lists and find that they are not noticed, they must let me know at once, as I want to get all. I will give the names of those who send every week Remember there is no need to hurry; take plenty of time.

GREAT bunches of lilacs are brought into the city every morning to be sold on the streets. While the apple blossoms were fresh great baskets of them found their way into the city to brighten the homes and dingy offices. We had some in our office, and they made the place seem brighter and fresher. There are few flowers more beautiful than apple blossoms. When the trees begin to burst out into bloom in the Spring there are few things more lovely.

IT will soon be time to fight the potato bugs. I hope you will all be able to get the best of them. The little rascals are hungry and greedy just now, and we must head them off if we want any potatoes for next Winter. I suppose most of you have spent a good many days knocking the bugs off the vines into pans. That is pretty slow work. It is faster work to kill them with Paris-green mixed with plaster or flour. We must be very careful in handling this though, for it is a deadly poison.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I wrote before and did not receive any answer. Thanks for the sweet peas you sent me. I planted them and they are three inches high now. My little brother catches moles in his Grandpas's barn with a mouse trap, and if you spit at them they sing like a bird. They are as large as a mouse. They make us all laugh to hear them. Mother calls them singing mice. I am going to try for the plow. WILLIE BYRAM.

Dover, N. J.

[If people should spit at me I don't think I should feel like singing. I guess the moles cry because they are angry, and not because they are glad.]

DEAR UNCLE MARK: I have been reading the letters from the Cousins in the RURAL ever since papa has taken it. I would like to join the Y. H. C., if you will let me. This is the first time I have written. I am 14 years of age. We have a dog and two cats. The dog is a shepherd, and we call him Shep; and the cats' names are Tom and Tim. We weighed our dog this morning, and he weighs 110 pounds. Papa has planted the corn that he got with the RURAL'S free seed distribution, and Mamma has planted the peas. The peas are up nicely. Papa owns and runs a thrashing machine, and he is away thrashing every Fall. We have 28 young chickens and five young ducks, and they are all doing well.

From your niece, L. H. SCHADT.

Greenville, Penn'a.

[That dog will make a pretty good-sized Cousin. Some of us will have to grow in order to reach his weight.—U. M.]

DEAR UNCLE MARK: Mamma read in the R. N.-Y. something about a blue sun-flower. We raise sun-flowers; some of them are very large. Last year we had no Exposition, but the year before we had one. There was a sun-flower that took the premium the last time, and it measured 14 inches in diameter. I had one that measured 15 inches. Its seed were so full of oil that when I took the seeds out of the shell, I got my fingers all black. If there is a sun-flower that has a blue flower I wish you would tell me where I could buy the seeds. Uncle Mark, this year was the first time we got our seeds from the RURAL. Mamma says she believes they came, but the mail-carrier kept them. I am 11 years old: I wish I lived in the country; I hate city life. I never rode horse-back over six times in my life. When I read the letters from the Cousins I almost envy them. Sometime we expect to live in the country. We can see the Colorado Front Range, and the Sangre De Christo Range, and Pikes Peak. Were you ever in Denver? If you were you know it is built in a valley. The South Platte runs through it. On the hottest day in Summer when we are sweltering down here we can look up on Pikes Peak and see the snow up there and imagine the Signal Service agent up there wearing an overcoat I can't imagine my looking to the West without seeing the mountains. I suppose if I were to go back East and not see them I would think the world was sinking out of sight.

Your niece, MAGGIE JOHNS.

Denver, Colo.

[Who can tell about the sunflowers? I have never seen them. I have been in Denver and have seen the mountains many times. I wish I could see them again.—U. M.]

DEAR UNCLE MARK: It has been a long time since I wrote to you. I don't have much time to write letters only on Sunday. I have planted some of my flower seed in boxes in the house. I received the sweet pea seed you sent me and send many thanks for them. I enjoy reading the letters from the Cousins, but I don't enjoy reading the advertisement which has been put in the children's column. I like to see more letters printed and not so much advertisement. Why don't some of the Cousins send some lace patterns, or don't they do any fancy work? I would like to see the children's page filled up with fancy work and other useful things for the girls. I am going to raise some onions this Summer to sell. Our school commences in about a week. I will send a lace pattern which I think is simple but real pretty.

Cast on 11 stiches. Knit across plain two or three times.

First row—Knit four plain, thread over twice, knit two together, thread over twice, knit two together, thread over twice, knit two together, knit one.

Second row—Knit three, purl one, knit two, purl one, knit two, purl one, knit four.

Third row—Knit plain.

Fourth row—Knit plain.

Fifth row—Knit plain.

Sixth row—Bind off three, knit 10.

C. A. D.

DEAR UNCLE MARK AND RURAL COUSINS: I promised I would write you of my home. Papa has a farm of 115 acres. We have one horse, four yokes of steers, two cows, 10 sheep, 10 little lambs, and 40 hens. We live where we can see the lights from Faulkner's Island Lighthouse and Horton's Point Lighthouse. In hot weather we enjoy going picnicing down by the salt water. I would like to have you come and go sailing with us this Summer. I have four brothers and two sisters. We drink nothing but cold water; and my brothers do not scent their breath and handkerchiefs with tobacco. I have been trying to learn how to spin stocking yarn, but I don't think I shall take first prize at the fair this Fall unless I make improvements. I thank you very much for the seeds you sent us, I shall try very hard to have them all grow, for I am very fond of flowers. I have been wishing I could send you something. I have some Wild Goose Beans, the same kind that my great-grandpa used to raise—I have been told they could not be bought at the seed stores. Would you like to have me send you some?

Your loving niece, ELLA K. BARRETT.

New Haven Co., Conn.

[Yes, I would like the beans. I will plan them. If you try hard I think you can get that prize.—U. M.]

DEAR UNCLE MARK: I would like to join the Y. H. C., I am 13 years old. I like to read the Cousins' letters very much. I have one sister and two brothers. My sister will be 18 years old in June. We have 11 lambs; four of them are mine. We raised quite a lot of flowers. Our Lunar lily has seven buds on it this year. I set a hen with 12 eggs, and she hatched all of them. If you will admit me I will write more next time.

Centralia, Ill. BLUE BELL.

[Well done for that hen. She deserves extra good care for that.—U. M.]

DEAR UNCLE MARK: I have long read with interest the letters from Cousins in the RURAL, and enjoy them very much. I would like to join the Y. H. C. I am 14 years old. I live on a farm. I go to school, which is about one-half of a mile from where I live. I study arithmetic, grammar, geography, history and writing. We (the scholars have to speak pieces every two weeks. If any one has any pieces that would be good to speak I would like to have them send them. I have some old ones that I have spoken, but would like some new ones. I will send what pieces I have if any one would like them. Well, I think I had better stop for fear this letter is too long. Hoping to see this in print, I will stop, also hoping to join the Y. H. C.

Ashtabula, Ohio. MILLIE BALDWIN.

[It is hard to find suitable pieces for speaking. I have no doubt some of the Cousins will be glad to change with you. I find the 100 Choice Selections good books for speakers.—U. M.]

DEAR UNCLE MARK AND COUSINS: I hope I am to be admitted into "your family." I am eight years old and live in the country, and we call where I live "Forest Home." Father built right in the woods, where grow the oak, elm, maple, beech, sugar-tree, hickory, walnut, dog-wood, red-bud, white ash (and Oh! how beautiful when in bloom), and the evergreen cedars, arbor-vitæ, and spruce. The pretty birds build their nests and rear their young ones around the house. Mother has the ever-blooming roses, the old fashioned roses, and beds of flowers, which take in the "garden treasures." Don't you think I am one of the happiest of little girls, playing with my dear little sister and brother under the trees, on the green grass, and among the flowers and birds? About two years ago, father gave me a heifer, and now I have three head of cattle, and I am going to try to raise enough so that I can buy me an organ with my own money. With love to Uncle Mark, the Cousins and every body.

I am, ELIZABETH M. HAWKINS.

Midway, Tenn.

[Yes, indeed you ought to be happy. Many of these poor little city children will envy you your home. I hope you will have the organ. —U. M.]

UNCLE MARK: I, too, would like to join the Y. H. C. I am eight years old. I have one mile to go to school. I had a little garden last Summer; and had corn, radishes, peppers, beans, turnips and potatoes. I am going to try and have a better one this Summer. We live on a farm, and have horses, cows, pigs and hens. A fox came the other night and caught an old hen and two chickens, and left five little chickens for me to take care of. We set a trap for the fox and caught a cat. It looks very pleasant here now with the fruit trees all in blossom. We have a large strawberry bed. Your nephew,

Pompey, N. Y. MASON BERRY.

[Too bad about that fox. It is a pity you could not catch him. Perhaps the cat wanted to steal too. I like to see thieves caught.—U. M.]

WHO can tell us how to raise big melons? We want to know how to win the prize and also to take the premium at the County Fair.

LETTERS received from Mary J. and Nelly Baymiller, Eva Bomber, Moses P. Adams, Neal Eckerson, Lillie Moore, Ida M. and Ellen Jackson, Nellie M. Sankey, Alice F. Greenewalt, S. G. Anderson,

PERSONALS.

IT is said that the membership of the United States Senate represent $162,000,000 of wealth.

IT isn't the mother of 44, but the daughter of 20 Grover is to marry, in spite of late reports.

THE creditors of Ferdinand Ward have sold what they could of his property for having sold them.

JOHN DEERE, the first to apply steel to the manufacture of plows, died Monday evening, at his home at Moline, Ill.

THE wife of the Chicago Anarchist leader, Parsons, asks for a suspension of judgment in his case; there should be a suspension of him.

LOUIS RIEL'S widow is dying broken-hearted, at St. Vital, Manitoba. She never recovered from the shock of her husband's execution.

CATHOLIC Archbishop Croke, of Cashel, Ireland, a bitter Nationalist, has put a portrait of Gladstone in his private gallery—the first Englishman ever so honored.

KING KALAKAUA is an active member of the Honolulu fire department. He runs to fires with the engine, and is an expert operator of the pump handle.

MRS. BUCKINGHAM, the richest woman fruit-farmer in California, has an orchard a mile long, with row after row of pear, cherry, peach and apricot trees.

PRESIDENT CLEVELAND very properly refuses to discuss his prospective marriage; the right of telling about that sort of thing belongs exculsively to Miss Folsom.

E. B. WASHBURNE, of Chicago, has accepted the presidency of the American exhibition, to be held in London, commencing May 2, 1887, and to continue two months.

POWDERLY, head of the Knights of Labor, was boycotted 10 years ago, so that for months he could get nothing to do; naturally, therefore, he hates boycotting.

SEC. LAMAR says he "would vigorously protest if Land Commissioner Sparks should intimate an intention to resign." "No honest, bona-fide settler," says he, "has anything to fear from his rulings."

THE Queen proposes to make Wales's eldest son the Duke of Kent, Victoria's father's title, which will give him a seat in the House of Lords, and the people will be asked to give him an annuity of $50,000 for so sitting.

MR. LOWELL caught a severe cold on his voyage to England, and Dr. Holmes was quite ill on his arrival. But both are now in good health and are the recipients of kindly attention. Dr. Holmes has been treated with marked courtesy. Among the authors and the reading public of England he has always been exceedingly popular.

THE New York Legislature having amended the code so as to remove the restrictions against women practicing in the law courts, the Supreme Court, on Thursday, admitted Miss Kate Stoneman, of Albany, to the Bar—the first female lawyer in the Empire State. Women can practice law now in 16 States and two Territories; but there are only 48 female lawyers.

ANDREW CARNEGIE, the steel-rail millionaire, has been trying for some time to give Pittsburg, Pa., a $250,000 public library, but the city cannot legally increase its indebtedness and declines the offer. Allegheny City now steps in with an offer of a site and the money to run the library if established there, and Mr. Carnegie is considering.

AGENT MCGILLICUDDY, of the Pine Ridge Sioux Agency, in Dakota, has been suspended by the Interior Department for insubordination in refusing to accept a new clerk appointed to his agency. He has long had much trouble with Red Cloud and his intractable band, but has always carried things with a high hand. A major of the 7th cavalry is temporarily in charge of the agency.

EX-PRESIDENT ARTHUR drove out Wednesday and is improving. While he was Collector of this port there was an "unaccountable shortage" of $5,000, and a "descrepancy" of $3,436.83 in the accounts of a dead subordinate—making a shortage of $8,436.88. Arthur had to pay it, but Congress is likely to repay him, as no one attributes the loss to him.

THURSDAY afternoon, Mrs. Alice Pendleton, aged 61, wife of Hon. G. H. Pendleton, of Ohio, our Minister at Berlin, jumped from a hired runaway carriage here in Central Park, and pitching on her head in the road, was instantly killed. Her daughter, Jane Frances Pendleton, aged 22, also jumped, but though seriously was not fatally hurt. Both had left Berlin two months ago, and were to return soon. Mrs. P. was daughter of Francis Scott Key, author of "The Star Spangled Banner," sister of Philip Barton Key, killed by Gen. Sickles, and niece of Chief Justice Roger B. Taney.

Humorous.

A SOLDIER said he never knew what it was to "break ranks" until he fell into a basket of bad eggs.

"ADIEU," she said sweetly, as he kissed her good night. "He's adieu'd, aint he?" sung out her little brother as he vanished up stairs.

ETHEL, having put on a lady's bonnet and surveyed herself before the mirror, thus addressed herself: "Oh, ain't you a 'boss woman!"

ANOTHER cold wave, said the young man when his two sisters and three cousins standing in front of an ice cream saloon beckoned him to come over.

"ON what grounds do you leave me without a customary week's notice?" indignantly asked a boarding-house mistress of a leaving boarder. "Coffee grounds, mum, coffee grounds," he tartly replied.

A CITY girl saw a hen preparing to gather her chickens under her wings and shouted excitedly: "Oh! don't sit down on those beautiful little birds, you great, ugly old rooster!"

"WHAT are chilled plows, papa?" asked the little son of an agricultural professor. "Oh, my son," was the wise reply, "they are plows which have stood out in furrow all winter."

CLARA (looking at the bonnets, etc.): "Don't you think they are handsome?" Amy (whose thoughts are on the other side of the street): "Very, 'specially the one with the black mustache."

A LITTLE girl was walking on the street the other day, when she saw a very bowlegged man with a short coat on. "Oh, ma!" she cried, "there's a man with a tunnel under him."

SENIOR visits his girl at professor's house, getting quite late; conversation lags; girl nods; animal of the long-eared genus brays; girl starts and says, "What did you say, dear?"

A LITTLE girl's father sang in a church choir in Boston. Upon attending church here she noticed that the singers' seats were in the rear gallery. She inquired: "Does my papa sit in the attic and sing, same as they do here?"

A LITTLE boy came running into the house and told his mother he had kicked another boy. "Why did you not stop and take the consequences?" inquired his mother. "Oh," he replied, "I took the consequences before I kicked him."

CORNELL UNIVERSITY.

AGRICULTURAL DEPARTMENT

In the year 1886-87 courses of instruction will be given as follows:

In Agricultural and Applied Chemistry; Professors CALDWELL, SCHAEFFER and NEWBERRY: 8 Courses.
In Botany, Horticulture and Arboriculture; Professors PRENTISS and DUDLEY: 14 Courses.
In Entomology and General Invertebrate Zoology; Professor COMSTOCK: 7 Courses.
In Geology; Professor H. S. WILLIAMS: 3 Courses.
In Veterinary Science; Professor LAW: 3 Courses.
In Applied Agriculture; Professor ROBERTS: 6 Courses.

During the present year a course of lectures is given on the Management of the Dairy by the Honorable L. B. Arnold; a similar course may be expected next year.

A veterinarian building is to be erected in the course of the present year, and four rooms are to be added to the Agricultural Laboratory and Museum.

The University Farm contains 257 acres, of which about 125 acres are in tillage. The farm contains two very large barns, a dairy house, and an excellent herd of stock. All the appliances of the Farm are used chiefly for the purposes of illustrative and experimental husbandry.

Students who take the full course and pass the requisite examinations receive the degree of Bachelor of Science in Agriculture.

Students not candidates for a degree are received without examination as "Special Students" and are admitted to any or all of the above courses, provided the applicants are 18 or more years of age; and provided they satisfy the Professors of Agriculture of their disposition and ability to profit by the instruction.

The next collegiate year begins September 14, 1886!
To all students of Agriculture "TUITION IS FREE."
Full information sent on application. Questions concerning courses of study should be addressed to I. P. ROBERTS, Professor of Agriculture; all other questions to **E. L. WILLIAMS,** TREASURER,
CORNELL UNIVERSITY, Ithaca, N. Y., May, 1886.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1897. NEW YORK, JUNE 5, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

MARY WAGER-FISHER. From a Photograph, by Taber, of San Francisco. Fig. 238.

Biographical.

MARY WAGER-FISHER.

AN AUTOBIOGRAPHICAL SKETCH.

AT our repeated request, our esteemed contributor and friend, Mrs. Mary Wager-Fisher, has consented to favor us and our readers with the following characteristic autobiographical sketch. As it was written while she was away off in California, while "the records of her life" were at her home in Pennsylvania, she was, as she writes us, "quite at sea as to dates and events"; but her breezy sketch of her own career will convey a better idea of the woman as she is than could be imparted by any formal biography. She writes:

To the best of my knowledge and belief, I was born in Tompkins County, New York State—that county made immortal by its glorious "King Apple"—and I grew up on a farm that overlooked Cayuga Lake. My father was of English and Scotch blood; my mother was of Holland descent. Both my parents were persons of "faculty" and energetic to quite an unusual degree—to a destructive degree, for my mother died in her thirties and my father in his fifties. I remember that my mother had quite a local fame for her excellent spelling. She taught me to sew and knit, and I have a bed-quilt of which I cut and sewed the pieces when I was five years old. I hated to knit. My father's house was quite a rendezvous for Methodist preachers, and I heard a great many discussions as to foreordination, answer to prayer, etc. Being in despair one day as to my detested knitting, it occurred to me that it would be quite as easy for my stocking to be finished by faith as for a mountain to be removed. So, rolling it up carefully in a cloth, and putting it in a box in a spare bed-room, I knelt down and prayed God to finish my stocking, and I allowed two hours for the performance of the task. My subsequent chagrin upon finding that my prayer had not been heeded fully converted me to a belief in the uselessness of that kind of prayer, and convinced me that thereafter if I wanted anything accomplished, the only way to get it done was *to do it*, and I have never yet learned any better way.

As a child I had a furious temper, and often, when my dear mother was on her dying bed, she would call me to her, and beg me to govern my temper—not to give way to such wild outbursts of impatience. I was barely 11 years old when she died, and with my "fiery" disposition and willful temper, it is easy to imagine that my young career from that time on was by no means along a path of roses.

I can't remember when my dreams of the future did not far outrun any probable outcome of fact. I would not only be great, but I would be useful! I wished to work for the reformation of the world; for the happiness of the wretched, and I had many a skirmish with my father and two older brothers in regard to "woman's sphere." The boys laughed, and the father said I would fill my "sphere," if I learned to make butter and bread! As I think of it all now, I can feel all those days and years over again—and I blaze anew with wrath! However, I learned to make butter and bread—in a small way, to be sure—and turned my hand at the multifarious tasks of farm-house life—and I may as well make a note of it here—I never learned anything that did not at some time afterward serve me a "good turn." I first began to go to school at the mature age of three years, having first learned the alphabet and small words, and as my parents both felt the great importance of education, their children were kept continuously in school, and their progress in study was carefully watched. We were trained in Puritan fashion, and while my father was keenly alive to our best welfare, he was not given to frequent expressions of affection.

Filled as I was with a spirit of impetuosity, there had to be an outlet for it somehow, and I took to "scribbling" when about 13 years of age, and it was not long afterwards that my first effusion appeared in print in the county paper. It was an essay on "Death." I still have a copy of it, along with the succeeding "effusions" of the two or three years that followed, when I poured out the morbid feelings and vexations of that unhappy period. Meantime, I graduated from the public school into an academy, and I think I was about 15 or 16 years of age when I sent my first contribution to MOORE'S RURAL NEW-YORKER. Of course, as with most young writers, I wrote "poetry," and all my work was very crude. Most of my offerings were published, but further than that I never received any recognition of them from the Rochester office, until one day a note came to me from Charles D. Bragdon, the Associate Editor, giving me some suggestions as to "style."

In due time I went to college, my father yielding very reluctantly to what he considered my "high-headed" notions; but as I look back upon that time now, it was the cheapest disposition to make of me, for had I been foiled in that, he might as well have had a young whirlwind in the house. I believe I had a fair record as a pupil, was heedless of rules, wrote all the time for the R. N.-Y., had typhoid fever during the last year—nearly died—recovered rapidly and by dint of overstudy passed my examinations, got my diploma and returned home, broken in health. It was about this time that I sent an article, anent some recent novel, to a New York paper, and the editor sent me in payment for it a $5 greenback. It was the first money I had received for a literary production and it marked an event in my life. It was a proud moment for me, as I held it up for my father to see, and in the pleased surprise it gave him, he exclaimed, "Well, who knows but the girl will amount to something after all!" This success with a New York paper emboldened me to further effort, and I contributed to various journals, but without pecuniary success.

My ill health induced my father to take me to Philadelphia, where he left me for a time, and I returned home by way of New York, which gave me quite an idea of "the world." The following Winter I spent in Virginia, and during the Winter my father died. My only sister had died while I was in school, and my oldest brother, a young man of brilliant promise, had fallen in the war. It seemed a very sad world to me. My father's death deprived me of everything that was stable, and in the indecision that followed, as to what I was to do with myself, I concluded to see what I could do with my pen. The matrimonial gate was accommodatingly open, but I resolved that if ever I entered in thereat, it must be a long way off. I had no health to speak of, but I had a little fortune and abundant hope, so I went to New York, following, as I had all my life, a sort of hap-hazard destiny, without direction from any one. That I was successful in my writing from this first year in New York was chiefly owing, I think to my "country greenness." I saw everything with an unhackneyed eye, and I expressed myself with a vim and audacity devoid of discretion or conventional propriety.

Very soon after this, Mr. Moore came with the then MOORE'S RURAL NEW-YORKER to New York, and I called upon him at his office and asked him to give me a place on the RURAL. It was a very amusing interview, and I remember very well his expression when I gave him my name: "Why, you're just the girl I wanted to see," and he proceeded to tell me what he wished me to do. In a day or two Mr. Bragdon arrived from Chicago as Associate Editor, and I was very much guided in my work by his advice, and during several years thereafter he was my most helpful and valued friend. He was a man of rare qualities, true, devoted and generous to a fault. The RURAL office was a pleasant place. Mr. Moore was kindness itself, and treated me with great generosity. Col. Harris was there for a time—one of the most genial of men. I had charge of the Department of Domestic Economy, and established the Fashion Department, which went under the name of "Mintwood's Conversazione." In addition, I wrote of art, reviewed some books and described some events. I think it was in the Summer following my connection with the RURAL that I made a trip "out West," going nearly to the extreme westerly limit of Kansas. The previous Summer I had spent a month in New Hampshire. Another Summer I spent in Newport, Saratoga and on Lake George, and still another at Long Branch—always winding up the summer months in the neighborhood of my old home in Central New York. Two Winters I spent in Washington, and it was during the second one that I decided to go to Europe. I was never able, in my best days, to write more than two or three hours at the most without suffering greatly from nervous exhaustion, although it was no special effort for me to write. Whatever ambition I may have had to "amount to something," was very thoroughly nipped by typhoid fever as to its realization, although I don't imagine that I should ever have "set the Thames on fire" if I had had the strength of Hercules. I should have done much better work and more of it, simply.

The two years I had in Europe I spent in England, France, Italy, Austria, with a tour into Hungary and a short stay in Munich. I spent all of one Winter in close study in the National Library of Paris, where I collected material for various magazine articles, which afterward appeared in the "Galaxy," "Good Company," "Lippincott's," "Appleton's Journal," and Harpers' Bazar. I wrote letters during the time to the RURAL, the New York World and the Daily Graphic. While in Rome, I made the acquaintance of the gentleman whom I married in New York in 1876—one year and a half after my return from Europe. In 1875 I was engaged as correspondent of the "American Register," a journal published in Paris and London, which position I have since held. During the years I spent in New York, connected with the RURAL, I also wrote for the World, Tribune, Herald, New York Citizen, Harpers' Weekly (some stories), the Coachmaker's Magazine (stories and French translations), etc., etc.

During the transition of the RURAL, when it passed from the hands of Mr. Moore, and eventually into those of its present owner, I contributed very little, if any, to its pages. But since the inauguration of its present management, my contributions have certainly been frequent enough to satisfy my most "ardent admirers," if there be any such, and it is but natural to infer that, with my long association with the RURAL from "youth to old age," my affection for it is of a very pronounced character, and I feel as much pride in its beautiful appearance and prosperous condition as if I owned it. And its thousands of readers, I trust, are my friends.

MARY WAGER-FISHER.

Dairy Husbandry.

IT IS REASONABLE, LET'S DEMAND IT.

J. S. WOODWARD.

THE agents and lobbyists who represent the bogus-butter makers at Washington are an unmitigated set of liars, when they assert that the stuff is made only of the purest materials and is mainly sold only for what it is. It is a fact, patent to every one, that ninety-nine-hundreths of all that is sold is put up in packages exactly like those used for the best butter, and is sold as genuine butter and under names suggestive only of the product of some favored herd, whose only food is the fragrant grass, and whose drink is water as bright and sparkling as the dew-drops. The whole business of its sale is a fraud, an unblushing fraud from beginning to end. The people at large will not eat any compound made from the waste of the slaughter-houses if they know it, and in order to force its sale, bogus butter must be dressed in the habiliments of pure butter and labeled as such. If occasionally sold for what it is, it is to dealers to sell again, or to restaurant or boarding-house keepers, for the express purpose of taking the place of pure butter to the deception of the consumers.

If it were true that it is always made of the cleanest caul fat or even of the best suet, it would not be so bad; but men who make a business of deception and fraud are not at all scrupulous as to the extent of the fraud, so long as it adds to the percentage of profit, and by the aid of modern chemistry there is nothing in the fat line so filthy or disgusting that it cannot be deodorized and incorporated into the stuff. The lively opposition of the manufacturers of cotton-seed oil to the measures now before Congress proves very clearly that much of their product finds its way into the stuff, and the claim made by the Western butchers that the passage of these laws would reduce the price of every bullock slaughtered $10, shows that much besides the caul and kidney fat of these animals must be used for this purpose. The whole business is dishonest and worse than the issue of counterfeit money; for while that only affects the medium of exchange, this directly affects the food of the whole people. Possibly it can be made so as not to be absolutely unhealthy; but that it can be made as good as pure butter is a falsehood, and no one knows it better than the manufacturers of the stuff.

It is not the dairy interest alone that is injured by this fraud; for the economy of every family is outraged; nothing is further from the purpose of its makers than to make a substitute for butter; such claims are fraudulent; what they aim to do is to make a cheap imitation and to fraudulently sell it as butter, and for the price and in the place of butter, and every one to whom it is sold is robbed. If such was not the case, the manufacturers could not and would not object to any law compelling it to be put up, and colored even, so that it could not be mistaken for butter. If people are to be induced to eat any compound in the place of butter, it must be attractive, wholesome, and the consumers must be made to believe it to be cleanly made, and nothing will so quickly bring this about as legislation placing its manufacture under the supervision of proper officers.

We farmers ask for no restrictions on its manufacture, nor for more than a mere nominal tax, just sufficient to pay the cost of supervision; but we demand a law regulating its manufacture, so that it shall be innocuous to health and put up so as to be distinguished, and then sold for just what it is. If the dairy interests of this country cannot compete with an honest substitute for butter, then let them go to the wall. They have no more right to ask for any restrictions on the manufacture of any competing substance than have the manufacturers of iron; nor do they ask for any such. We ask for only what every honest man has a right to demand of the Government, protection against fraud and false pretences, and these are the pillars on which rest the whole bogus butter trade. Without these it could not exist, and against these it is the acknowledged duty of the Government to protect both producers and consumers. In this bogus product can be used the nastiest and most revolting fats and at an enormous profit, and the ordinary people have no means of detection, and Congress owes it to the Nation to place the manufacture under supervision, and to insist that the product shall be so made as to be a safe food and to be easily and certainly distinguished; this is as plain as that the people have the right to be protected in the money they use, or protected from lottery or other swindles.

It is for the interest of the whole people that Congress should move promptly in this matter, and all farmers should see to it that the members from their districts be made aware of their desires. That Congress has an eye to the wishes of the country, is plain to every one who has watched the sudden change of certain Senators even on the bill modifying the postage on seeds. Let petitions asking for a stringent law be circulated in every neighborhood, and let the names be sent in a flood upon the members, and no one need have a fear of some salutary action.

Niagara Co., N. Y.

THE LARGEST TWO-YEAR-OLD MILK AND BUTTER RECORD.

WE have just received from Messrs. Smiths, Powell & Lamb, of Syracuse, New York, the sworn statement of the milk and butter records of two of their Holstein-Friesian two-year-old calves, which are certainly marvels. Albino 2d, H. H. B. 3500, dropped her first calf April 7, 1885, being then two years, one month and 23 days old. Her record commenced on the morning of April 11, 1885, and ended on the evening of April 10, 1886, just 365 days. During this time she gave 18,366 pounds two ounces of milk, and at the end her daily record was higher than at the beginning. From the morning of May 5, 1885, to the evening of May 6, 1886, one year, she gave 18,462 pounds one ounce, surpassing by 715 pounds 15 ounces the famous two-year-old record of Aggie 2d, which was 17,746 pounds two ounces, and she was some months older than Albino 2d when her record began. Several well known Holstein-Friesian men, such as Mr. S. Hoxie, Dudley Miller, etc., tested her on special occasions during the trial, and her yield was always wonderful for an animal of her age. These gentlemen testify under oath to her performances.

Nearly as remarkable is the butter test of Benola Fletcher, H. H. B. 6891, belonging to the same firm, which dropped her first calf on April 18, 1885, and was put to a butter test on April 30, 1885, being then two years, one month and 20 days old. From April 30 to May 6, inclusive, she gave 300 pounds, one ounce of milk, from which were made 16 pounds nine ounces of worked, unsalted butter, being an average of one pound of butter from 18 11-100 pounds of milk. In just one year, ending April 19, 1886, she has given 13,159 pounds four ounces of milk. Her butter and milk records are sworn to by the man who made the butter, the superintendent of the farm and the person who milked her through the year. Certainly both these records are memorable additions to the honorable achievements already accomplished at the Lakeside Farm.

MILKING STOOL.

ALL kinds of milking stools are in use. Few other farm implements have so wide a range of construction. Frequently a simple block of wood is made to answer, or a board is nailed to the top of the stick. In the South, where the greater part of the milking is done by negro women, we have frequently seen the milkers on their knees under the cows, with the pail resting on the ground. Some dairymen, more elegant, and with an eye to their own comfort, bring out a comfortable chair, or even make a stool out of the pail itself. The stool shown at Fig. 242 is simple, easily

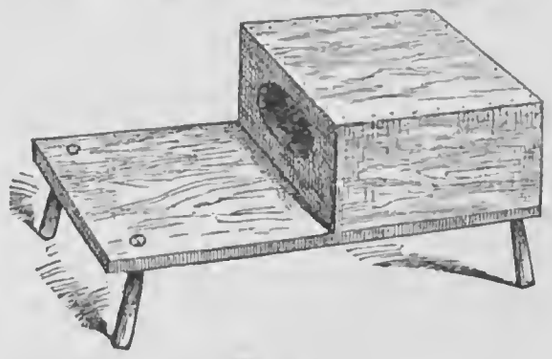

Fig. 242.

made and convenient. It is used by Robert Crane, Jr., of Bucks Co., Pa., who prefers it to all others. It is made of ordinary pine boards. The legs are six inches long. A cloth is kept in the box, so that the cow's udder can be quickly cleaned. The pail is placed on the board in front and held in place with the knees. The cow is unable to kick it away, and it is up out of the dirt, and there is no danger of its slipping from between the knees.

ABORTION AMONG COWS.

BREEDERS have had much trouble the past few years with abortions. These premature births have so lessened the profits as to partly discourage some of our breeders. I have not had a single case, but in my observation among herds where it has occurred, I wondered if the cause could not be often easily divined. In one place horses and cattle were all together. One kick from a playful colt is enough to produce premature parturition. In other herds frisky steers and young cattle were with breeding cows. I am fully persuaded that much of the dreaded abortion could be avoided if we should keep our breeding stock away from all other stock that could or would drive them harshly about or worry them. Cows, if Short-horns and in proper condition, will rarely injure each other. A little more expense in yard-making may be a sure and economical remedy for abortion. SHORT-HORN.

The Poultry Yard.

VALUE OF PURE BREEDS TO FARMERS.

Value of pure breeds; best crosses for grading up; inclosing fowls; overfeeding; green food; daily rations; lice.

WERE the nature and characteristics of the various pure breeds of fowls better understood, no doubt farmers would resort to them more generally to improve their stock by crossing or use pure breeds altogether. As all the pure breeds possess some points of value peculiar to themselves, I could not recommend any one that answers all requirements. That judicious crossing of some of the pure breeds upon common fowls improves the latter is a fact too well known to be doubted. Introducing new blood, an incidental feature of such crosses, is in itself a cause of improvement, as it infuses stamina and constitutional vigor into a flock. Some varieties are much hardier than others, and this is a feature that should be sought; for hens are profitable as egg producers just in proportion as they are able to withstand the hardships of severe weather. The Brahmas and Wyandottes are among the very hardiest of all the breeds. The former has the advantage of great size, while the latter matures early, and both have very small, low combs—a very essential feature in a hardy fowl. Hence, a cross with these breeds in the order named, is, I believe, the best to begin with to grade up common stock, followed another year by one with Pit Games or Leghorns, then reverting back to the larger breeds. Such a cross, if followed up, will produce a marked improvement in common fowls at a light expense each year for a good, pure-bred cock, which will be amply repaid in their improved condition both for laying and for market.

I find by experience that fowls inclosed in spacious runs, where they can have shade and grass in Summer, and warm, well lighted quarters in Winter, with cleanliness and proper diet, will thrive better the year round and yield better returns than if allowed to run out during all kinds of weather and trust to the hap-hazard subsistence so common on many farms. Why should we expect poultry to pay when they get poor keeping and no provision is made for their comfort, any more than we would expect the best results from horses, cows or sheep under like conditions?

While all fowls may be made to pay well with good care, I believe the pure breeds or their crosses, where judiciously selected and fed according to the requirements, will give the best results; the heavier breeds, such as the Brahmas, Cochins, and Plymouth Rocks, are too often overfed; their quiet disposition gives them a tendency to lay on fat too readily when fed all they will eat, and care should be taken to avoid this. The lighter breeds may, with impunity, be fed as much as they will eat up clean. Aside from a constant supply of gravel, ground oyster shells, etc., we all know, or ought to know, the value of green food for poultry the year round. Under this head, I may name potatoes, cabbage, onions, turnips, beets, etc. Few know what an excellent winter food is the mangel-wurzel. A very large quantity can be raised on a small piece of ground, and the roots are easily kept by merely pitting and covering them from severe frost, and then when taken out in Winter they are so crisp and tender that the fowls eat them ravenously. My practice has been to feed in the morning a mash of one half boiled potatoes, the other half about equal parts of corn meal, wheat bran, and ground oats, with occasionally a little ground oil cake added, and a few onions and meat scraps seasoned with a tablespoonful of salt—[we should leave this out.—EDS.]—to one-half bushel of feed, a little red pepper or ginger added now and then. At night, corn, wheat, oats, and buckwheat are fed each night alternately. No feed is given at noon, but, instead, we give what is no less beneficial to them, an armful of chaff or clover hay. This starts them scratching at once, and affords them exercise. Give them plenty of exercise in this way, especially when confined, and see that they as well as their quarters are kept clean and free from lice. Don't be afraid to pick up a fowl and examine it now and then. Part the feathers of the fluff and examine the skin underneath; you will sometimes in this way discover a condition of things that you did not suspect before. If you find upon thus examining your fowls

that they are troubled with lice, dust insect powder freely among the feathers under the wings and on the back. Where fowls have access to a good dust bath they can keep themselves free from this pest.

Good food in variety, such as above mentioned, cleanliness and a liberal supply of gravel, oyster shell, etc., will do all that any "egg food" can to increase the production of eggs. If green bones can be procured and broken up in small bits and fed, marrow and all, two or three times a week, they will be found one of the most valuable foods for egg production. ROBERT COATES.

Cook Co., Ill.

POULTRY IN CANADA.

THERE probably is no other occupation in the world in which there is such a vast difference between theory and practice as there is in poultry keeping, especially when conducted on a large scale. It is estimated that over 60 per cent. of the dry goods merchants fail in the world; but I believe there is a larger percentage of failures among extensive poultrymen. Every farm, however, should keep, say, 50 good hens, for there is no other kind of live stock so profitable, when the number is not too large for the range and food. I first tried pure Leghorns with poor success; they are not hardy, either when chicks or matured fowls, and are miserable things on the table. Non-sitters are not suitable for farmers: such a large proportion of their eggs are lost, and they are difficult to increase.

At present, Plymouth Rocks are our best all-purpose fowls for the following reasons:—1. They lay mostly when eggs are scarce and valuable, and the eggs are of a favorite brown color; 2, they are excellent mothers; 3, they are very hardy, both when chicks and mature; 4, they mature very early; 5, they are choice table fowls, beautifully colored meat being extensively produced on the breast, where it is of most value; and, 6, they have bare legs.

It pays to inclose farm fowl for short times, to keep them off small fruits and grain when ripening; and in early Spring, the best breeding stock should be kept separate from others. My plan is to have cheap portable hen-houses built on skids or runners, so that I move them about the pastures, stubble-grounds, and fallows during Summer, where fowls live well on grasshoppers and other insects, waste grain, etc. I keep these coops in the barn-yard during Winter. I believe wheat is good egg-producing food; but I receive the best results from cooked barley. I advise frequent change of diet, and I have always found it profitable in cool weather to feed them the meat of any animals that chanced to die. I find corn the best home-grown fattening food.

To buy pure-bred chicks in the Fall is much the best way of getting improved farm poultry. Then keep them separate from other fowls during breeding season. As soon as the stock of choice fowls is numerous enough, the old-time scrubs may be butchered to good advantage, in early Fall before beef, etc., become cheap. Buying expensive eggs is "buying a pig in a bag." Thoroughbred stock, with yearly change of males, has as much advantage over scrubs among chickens as among other stock. One of the worst losses is caused by keeping the hens till they are too old; they should be disposed of when three and one-half years old, or sooner. I cannot praise hen manure enough as plant food. It heads the list. F. W. WILSON.

Kent County, Ontario, Can.

POULTRY NOTES.

LEG weakness in chicks results usually from three causes—rapid growth, bottom heat in brooders, and the use of sulphur. Lard and sulphur rubbed on the legs of fowls, in damp weather, will cost them the use of their legs for awhile.

WHEN the hens appear droopy, and yet show no indications of disease or injury, remove the rooster, especially if the hens are fat. As soon as you have finished hatching chicks remove the roosters, as eggs from hens not in company with roosters will keep three times as long as will those that are fertile.

THE chick that seems nearly naked, and which feathers slowly, will be easier to raise, if kept warm, than one that begins to feather rapidly from the start. It is the feathering period that is the critical time with young chicks.
